

B BADGER PLUG

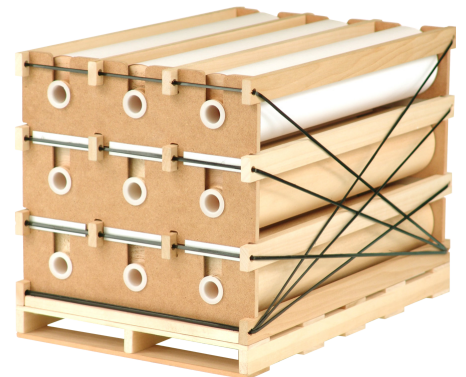

Badger Plug has been providing superior roll protection solutions since 1931. Its first products were wooden core plugs for the paper industry. As its reputation and customer base expanded beyond the Fox Valley of Wisconsin, Badger Plug developed new products to meet its customers' diverse needs. Along with value-added services, today the company offers an array of components in stamped and extruded metal, injection-molded and extruded plastic, molded and machined wood, and die-cut paperboard. All manufactured in the USA.

In September of 2016 a group from Badger Plug came to IMTS in Chicago and found the perfect machine to replace their aged tool room mill.

“We needed a machine with more power and physical capacity for die maintenance. But it also needed to be approachable and easy to use for prototyping and small jobs. We asked local machine shops and did our homework. After “playing” with a number of machines at IMTS, our team picked the Fryer MB-14R for its mix of power, high-quality mechanical components, and superior controller interface over other bed mills. Follow-up visits by Fryer product experts cemented our decision.

“impressive power and large, open bed area”

Our operators love the machine. With its impressive power and large, open bed area, we have yet to find a project the MB-14R can't tackle. Our customers trust us to deliver high quality, on time, every time. And the Fryer helps us do that.”
