

Founded in 1999, Cosentino Engineering is a technical design and prototyping consultancy that specializes in highly technical mechanical design, R&D and prototyping. Their strengths lie in the ability to apply basic engineering principles to a variety of problems and generate unique solutions. Part of their process involves proof-of-production verification and this is where the Fryer MC-40 shines. It was purchased in 2014 to upgrade their obsolete CNC system.

“Customer service response is fast”

“The Fryer’s large work envelope, rigid construction and oversized components allow us to reliably machine nearly any material with excellent results. The standard package includes enough features to provide a capable machine without the need for added cost options. The advanced Siemens control interfaces smoothly with the output from our PTC Creo NC system to allow fast screen-to-chip operation. Customer service response is fast and they are willing to assist in creating unconventional machining accessories. By far the best value CNC for the money out there.”
