

The Francis Tuttle Technology Center is a public career and technology education center affiliated with the state of Oklahoma Department of Career and Technology Education. Francis Tuttle has a dual focus, serving both high school and adult students.

They recently purchased a Fryer CM-15 CNC Mill with the Siemens-Fryer 828 Control for training and small project work.

We spoke with Dean Baker, the Manufacturing Technology Instructor who loves the control and the overall design of the machine, both aesthetically and construction. Dean says he really likes the ability to see into the machine from three sides, due to the large clear Lexan panels. This will aid in showing students the movements that the machine makes and understanding the cutting process. Dean is also extremely impressed at the user-friendliness of the control which will shorten the learning curve for instructors and operators alike.

“extremely impressed at the user-friendliness of the control”
