1.0 SAFETY INFORMATION

READ BEFORE INSTALLING OR OPERATING

NOTE: THIS MACHINE IS AUTOMATICALLY CONTROLLED AND MAY START AT ANY TIME.

All CNC machines contain hazards from rotating parts, belts and pulleys, high voltage electricity, noise, and compressed air. When using CNC machines and their components, basic safety precautions, including all appropriate LOTO procedures must always be followed to reduce the risk of personal injury and mechanical damage.

It is the machine owner's responsibility to make sure all personnel who are involved in installation and operation of this machine are thoroughly acquainted with the procedures and safety instructions provided herein BEFORE they perform any actual work.

Only Fryer factory-trained service personnel should troubleshoot and repair the equipment.

Do not modify or alter this equipment in any way without first consulting Fryer Machine. Any modification or alteration of this equipment could lead to personal injury and/or mechanical damage and could void your warranty.

1. Keep machine and area around it clean and well lit. Never allow chips, coolant, or oil to remain on the floor. Do not leave loose objects on or around machine.

2. Use appropriate eye and ear protection while operating the machine. ANSI-approved impact safety goggles and
OSHA-approved ear protection are recommended to reduce the risks of eye injury and hearing loss.

3. Keep all loose clothing, hair, and jewelry away from the machine at all times.

4. Gloves are easily caught in moving parts. Take them off before using the machine.

5. Always wear safety shoes with steel toes and oil-resistant soles.

6. Do not paint, alter, deface, or remove any warning plates from the machine. Replacement plates are available from Fryer Machine Systems.

7. Keep flammable liquids and materials away from the work area and hot chips.

8. Coolant and oils can make surfaces on the machine slippery. They can also present an electrical hazard if the machine has power on. Therefore, do not stand on any part of the machine at any time.

9. Keep vises, clamps, fixtures, or work pieces from extending beyond the back edge of the table.

10. Check for damaged parts and tools before operating the machine. Any part of a tool that is damaged should be properly repaired or replaced. Do not operate the machine if any component does not appear to be functioning correctly.

11. Improperly clamped parts machined at high speeds/feeds may be ejected and puncture the safety door. Machining oversized or marginally clamped parts is not safe.

12. To avoid tool changer damage, ensure that tools are properly aligned with the spindle drive lugs when loading tools.

13. Windows must be replaced immediately if damaged or severely scratched – contact the factory for replacement panels.

14. Do not attempt to operate the machine before all the installation instructions have been completed.

15. Be sure to review the maintenance section of this manual for instructions to keep your machine running properly.

1.01 Mechanical Safety

1. Always press Emergency Stop when the machine is not in use.

2. Never operate the machine with any cover or shield open or removed.

3. Never reach into the work area when the spindle is turning or if the machine is in automatic mode.

4. Put the machine in manual mode and be sure last programmed function has been completed before reaching inside of the work area.

5. The functions of the machine make it impossible to eliminate all pinch points. Be particularly aware of the following pinch points:
   a. Spindle and tool rotation
   b. Indexing of ATC and tools
   c. Table, saddle, and head.

6. Do not operate machine without axis motor covers or axis waycovers in place.

7. Report any loose, worn, or broken parts to your supervisor. The same action should be taken if any unusual noise or machine action occurs.

8. The electric components are protected from normal moisture resulting from humidity or use of water-based coolants. **DO NOT** however, use a water hose to clean the machine or the area around it.
9. Never touch a machine control device or electrical component when your hand is wet.

10. Never clean up chips while the machine is running or is in automatic mode.

11. Do not file workpieces being rotated under power.

12. At the end of the workday the machine should be placed in "EMERGENCY STOP MODE"

13. When restarting a machine after it has been shut down always assume it has been altered. Recheck all phases of the job as though you were running the first piece.

14. Never run the spindle until hands, feet, and body are well clear of the work area.

1.02 Electrical Safety

1. **WARNING**: Electrical enclosures contain high voltage. Disconnect equipment from power source before opening cabinets.

2. **Before replacing a fuse, switch off the machine.**

3. **Immediately turn off power if:**
   - Power problems develop
   - In the event of electrical storms.
   - Ambient temperatures exceed 105 degrees Fahrenheit (40 degrees C)

4. The electrical power must meet the specifications in this manual. Attempting to run the machine from any other source can cause severe damage and will void the warranty.

5. The electrical panel should always be closed and locked except during service.

6. When the main circuit breaker is on, there is high voltage throughout the electrical panel and some components operate at high temperatures, therefore extreme caution is required.

7. Do not reset a circuit breaker until the reason for the fault is investigated.

8. Never service the machine with the power connected.
2.0 BASIC INSTALLATION

2.1 WHERE TO PLACE YOUR MACHINE

Thank you for choosing Fryer Machine Systems. You have purchased a high quality, custom crafted machine tool designed and built to provide years of trouble-free service. To ensure that your machine is properly installed we ask that you review the following information prior to the shipment of your machine.

2.11 Foundation

Your foundation must be a minimum 6” (150mm) thick concrete slab floor and should be placed on a single slab with no seams. Be sure to leave space around the machine for leveling components and access to the electrical cabinet.

*If your floor does not meet these specifications, contact the factory for further recommendations.*

Install the machine on the first or second floor. Take the stress of ceiling and foundation into careful consideration to ensure that the machine load can be offset.

2.12 Environmental Conditions

Generally, the machine will be installed in the following conditions. However, these may change over a period of time or in response to seasonal changes.

- Supply voltage: +/- 10% of voltage listed on serial number tag.
- Source frequency: ±2 Hz of frequency listed on serial number tag
- Temperature effects dimensional accuracy, therefore, ambient temperatures should not exceed 105 degrees Fahrenheit. Also avoid exposing the machine to direct sunlight or heat rays which can change the environmental temperature.
- Relative Humidity: Less than 80% (Temperature changes should not cause condensation)
- Atmosphere: Free from excessive dust, fumes, corrosive gases, and salt
- Avoid exposing the machine to abnormal vibration.

2.2 UNLOADING YOUR MACHINE

Fryer machines are shipped on skids designed for forklift offloading. Be sure your forklift is rated for the proper weight of the machine.

*Note: If you are using a crane for offloading, please contact the factory in advance for instructions as damage can occur if supported in the wrong locations.*

2.3 RECEIVING YOUR MACHINE

*NOTE: If you have a door that is less than 8’ wide x 10’ high, please contact the factory prior to shipment so that we can make sure your machine is packaged to fit into your door openings.*

1. Fryer machines are carefully packed to avoid damage in transit; however, we ask that you **UNWRAP AND INSPECT YOUR MACHINE AS THOROUGHLY AS POSSIBLE PRIOR TO SIGNING THE BILL OF LADING.** If a digital camera is available, pictures should be taken before the machine is moved further. Pictures should be sent to service@fryermachine.com.

2. Place the machine in its location and complete inspection. If there is any damage to your machine, Fryer should be notified immediately. This will enable us to provide replacement parts before the service technician arrives install the machine.

3. If you have any questions about any of these installation instructions or other questions about your new Fryer Machine Systems machine, please call the Fryer Service Department and one of our trained technical staff will be happy to assist you.
2.4 UNPACK AND PLACE YOUR MACHINE

To make certain that your machine installation goes smoothly, it is important that the following items are completed prior to the arrival of the Fryer authorized service technician. This will ensure that our technician is able to provide you with the maximum amount of training during his allocated time with you.

1. Have your rigger move the machine to the operating location, remove it from the skid and install on ALL leveling pads.
2. Remove all packaging material and thoroughly clean the machine and inspect for hidden damage.
3. Remove all large assemblies from skids and stage next to machine to facilitate ease of assembly.
4. Install leveling pads and level machine. Level with a precision level, using the leveling screws and pads provided with the machine.

2.5 PRIOR TO THE ARRIVAL OF THE TECHNICIAN

2.51 Installation Safety Instructions

Initial start-up of the machine must be performed by a Fryer Machine Systems authorized service technician.

2.52 Cleaning & Lubricating Machine

All protective coatings (cosmoline) must be removed before using the machine.

Be cautious when selecting a suitable cleaning agent. Paraffin applied with a clean brush will soften the protective coating. The protective coating can then be removed with clean rags.

- WD-40 or a similar product is recommended for cleaning the machine. Do not use gasoline or any other flammable solution to clean the machine.
- Clean all exposed ways of the bed and saddle.

2.53 Line Voltage Check

Line voltage must be ± 10% of the voltage listed on the serial number tag.

INITIAL POWER-UP SHOULD ONLY BE PERFORMED BY A FRYER TECHNICIAN OR FACTORY AUTHORIZED REPRESENTATIVE.

2.54 Electrical Precautions

ELECTRICAL SCHEMATICS FOR YOUR MACHINE ARE LOCATED IN THE ELECTRICAL CABINET AND IN THIS MANUAL.

Wiring

1. Ensure that all local electrical codes are met.
2. Do not connect to the power distribution panel any power cables for devices that can cause line noise, such as welders and high frequency quenching machines.

Grounding
You should always refer to your local electrical code to be sure you are grounding to code. Generally, use a grounding wire with a cross section of more than 14 mm and a resistance to ground of less than 100 ohms. This wire size should be greater than AWG (American Wire Gauge) No. 5 and SWG (British Legal Standard Wire Gauge) No.6.

Generally, the machine should be grounded to a separate grounding rod. If an independent ground cannot be provided for the machine, prepare the ground connection as follows:

1. Connect a single conductor to its own grounding terminal. This will avoid possible serious accidents resulting from ground currents that might otherwise flow in the NC machine if a peripheral device should malfunction.

2. Be careful when using concrete reinforcing rods as grounding points. These reinforcing rods often are used to ground equipment because they usually offer a resistance to ground of less than 100 ohms. In doing so, make the connection as follows: (This also applies to connecting ground wires to regular grounding terminals)

3. Do not use the same grounding reinforcing rod or grounding terminal for other devices since this could lead to line noise such as produced electric welders and high frequency quenching machines.

4. Use a grounding terminal with an adequate electrical performance rating and which is durable.

5. A separate grounding wire should be used, one whose length is as short as possible.

6. Check the resistance to ground by actual measurement.

7. This should measure less than 100 ohms if the single device is connected to its own grounding rod.

**Desirable Independent Grounding**: Earth resistance: Less than 100 ohms

**Common Grounds**: Resistance to ground = 100/the number of devices connected to the grounding (Ω)

**NEVER GROUND EQUIPMENT IN SERIES!**

**Connection of Power Line**

NOTE: Electrical installation should only be completed by a qualified electrician.

1. Make sure that the incoming power is compatible with the requirements of the machine tool (voltage, amperage, phasing). All this information can be found on the machine’s serial number tag.

2. Power wires, grounding and over-voltage protection should comply with the local electrical code.

3. **DO NOT** connect if the incoming power is different from the power requirements of the machine. Contact a qualified electrician.
2.6 LEVELING THE MACHINE

Before attempting to use the machine, it will be necessary to accurately level it.

- Screw the leveling bolts (with nut) into the holes in the base of the machine. Set a leveling pad under.
- Please prepare the following tools to adjust machine level:
  - Precision level (0.0005”/ft. or 0.013mm/1000mm accuracy)
  - Two adjustable 32mm wrenches
- Clean the bed way and cross slide surfaces thoroughly and set one of the precision levels on the flat bed way in the longitudinal direction, and the other on the cross slide, perpendicular to the first (if there is only one level available, then use it on both directions alternately).
- Adjust the six leveling bolts located the bottom of the machine base until the machine is leveled to within 0.001”/ft. (0.08mm/1000mm) in both directions.
- Lock the nuts on the leveling bolts, and re-check to see whether the level of machine is still correct. Repeat as necessary until machine level is obtained with leveling bolts locked.
- After initial installation, check the level once a week for the first month, then check monthly thereafter.

2.61 Leveling Procedure

Step 1
- Set up your precision level in the middle of the machine table parallel to the X-axis.
- With the table centered in the X and Y-axis, adjust the machine’s four outside leveling studs to achieve level.
- Be sure that the center leveling pads are not touching and that all four outside pads have load.
- Also check to make sure that the machine casting is not touching the floor.

Step 2
- Now rotate the level 90 degrees so it is parallel to the Y-axis and again check level.
- Adjust the four outside leveling studs as needed.
- If any adjustments are required to achieve level, you must go back and re-check level with the level parallel to the X-axis.
- Repeat the adjustment process until the machine is perfectly level with the level parallel to both axes without further adjustment.
Step 3
- Adjust the center leveling studs until they are just touching.
- Again, verify the machine is level with the level parallel to both axes without further adjustment.

Step 4
- With the level parallel to the X-axis, slowly move the table back and forth over full Y-axis travel check to see that the level does not change. Make any required adjustments to achieve level.

Step 5
- Re-center the table in the Y-axis and again verify that the machine is level with the level parallel to both axes.
- Check that all leveling pads have some degree of load.
- Lock the nuts on the studs once the correct level is achieved.

Step 6
- The final check is “tramming” of the head. This is accomplished by mounting the indicator base on the spindle nose and setting the indicator tip on the tabletop at position “0” shown below. Properly load the indicator tip and zero the indicator at position “0”. Sweep the indicator tip by rotating the spindle manually over a 12” diameter circle. The indicator should show no more than .0005” total indicator reading. Record the values found at positions 1, 2, and 3.

3.2 MACHINE COMPONENTS

3.21 Axis Lubrication System

- The automatic way lube system is controlled by the PLC in the control. The system only pumps way oil when the spindle and axes are moving. If there is no machine movement the pump will not pump unnecessary oil. This method greatly reduces way lube usage and keeps oil out of the machine coolant sump and prevents fouling.

- If the machine has been unused for more than 48 hours press the blue pushbutton on the side of the lube tank for approximately 30 seconds to pump oil to the ways. The pressure gage on the tank will indicate if it is working properly.

- If the system detects low way lube it will display the following message in the control: 700040 - WAY OILER PRESSURE FAULT

3.22 Electrical System

- Schematics (1) – The Electrical and Pneumatic Schematics are inside electrical cabinet
- Cabinet Filter Type (2) – Purolator A23465 or equivalent
- Check Filter Interval - Weekly
- Change Filter Interval – As Required (depending on environment)
3.23 Pneumatic System

- Schematic – See Pneumatic Schematic in electrical cabinet (see previous page)
- Pneumatic List / Pressure Settings
  - Main Supply – 90-125 PSI at 5 CFM
  - Air Gun
  - Tool changer – Carousel In
  - Tool changer – Carousel out
  - Spindle Air Blast (Taper Cleaning Air) – Adjustable (Factory Set)
  - Drawbar Solenoid
  - 4th Axis Brake (optional)
  - Spray Mist – Adjustable on spray mist unit (optional)
  - Programmable Air Blast – Adjustable (optional)
  - X, Y, Z Glass Scale Purge – Set Regulator to 11.6–17.4 PSI
- Lubrication Requirements – Mobil Almo break free synthetic air tool oil 5W-10W or equivalent
- Check Lubrication Interval – Weekly – Add as needed
3.24 Automatic Tool Changer – CAT40 / BT40 – 12 or 20 Position, Carousel Style Automatic Tool Changer

- Maximum Tool Diameter – 3.20”
- Maximum Tool Diameter with adjacent positions empty – 5.50”
- Maximum Tool Length – 11.80”
- Maximum Tool Weight – 15.4 lbs.

Tool Carousel Maintenance
- Keep all tool grab fingers clean and free of debris.
- Clean all chips from the interior of the ATC daily. Take care to make sure the proximity switches and the cam / cam pockets are free of chip contamination.
- Grease the cam pockets every 6 months (see picture below).

![](image)

- Tool Changer Pneumatics
  - Tool carousel in and tool carousel out is controlled pneumatically.
  - Setting Tool Change Height – See Section 5.14 Setting Tool Change Height procedure
  - Setting Spindle Orient – See Section 5.17 Spindle Orient Adjustment Procedure

3.25 Spindle – CAT40 / BT40 - 8,000 RPM Spindle

Thermal expansion of the machine components can jeopardize machining accuracy. To prevent this condition always warm the machine up.

SPINDLE WARM UP – Use the chart below for daily startup

<table>
<thead>

</tr>
<tr>
<td>10 minutes @ 75%</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SPINDLE DUTY RATING – Follow the duty rating outlined below
- If it is required for the spindle to run continuously (24 hours a day), the spindle must not run above 80% of the maximum RPM.
- If it is required for the spindle to run at maximum RPM, the spindle must not run more than 2 hours straight. After 2 hours of run time at maximum RPM, the spindle must be slowed down to 50% of the maximum RPM for at least 30 minutes before running at the maximum RPM again.
The flood coolant system consists of a submersible flood pump mounted in the base casting of the machine. The flood line runs up the back of the column and through the Z-axis cable track. It splits at a y-fitting in the headstock where it runs to two separate lengths of loc-line.

- The submersible flood pump is mounted behind the access panel shown below.
- The sump can be drained for coolant changes by using a wet vaccum.
3.27 Fryer Tool Setter (Tool Probe)

The Fryer Tool Probe can only be used to automatically measure tool length. It cannot be used to measure tool diameter or radius. Optional tool setting probes are available to perform length and diameter or radius measurements.

**Tool Setter Calibration**

If you ordered the tool probe during the original build of the machine it will have already been mounted to the machine table and tested at the factory. However, it must be calibrated before using it to set up your tool length offsets.

1. Install the tool probe in the reamed hole in the table and make sure that it is plugged in.
2. Set up a tool holder with a ½” dowel pin installed.
3. Use the **NEW TOOL** key to create the setup tool in the tool library as a ½” tool using the default name **CALIBRATION TOOL**.

4. Complete a tool change to this tool so that it will be active in the control.
5. Set a negative tool length offset for the **CALIBRATION TOOL** by measuring the distance from the tip of the dowel (while Z is at machine zero) to the top of the table surface.
6. Make sure your active work offset is zero in the Z-Axis.
7. Use paper, shim stock, or a gauge block to touch the dowel to the table.
8. Press **MEASURE TOOL** key
9. Press **LENGTH MANUALLY** key
10. Select **WORKPIECE**
11. Type the thickness of the paper, shim, or gauge block into Z0
12. Press **SET LENGTH** key

Now position the dowel approximately 1/4” above the probe in Z and roughly over the center of the probe

1. Select **MEASURE TOOL**
2. Select **CALIBRATE PROBE**
3. Select **LENGTH ONLY**
4. Press **CYCLE START**
5. The tool will move down in the Z axis and touch the top of the probe.
6. Once finished the tool will move back up.
7. Select **BACK** twice to exit the calibration screen and go to the **MANUAL** screen.

Calibration is now complete.
3.28 Fryer Part Probe

The Fryer Part Probe can only be used to automatically measure X and Y axis positions. It cannot be used to measure in the Z axis. Optional part probes are available to perform 3-axis measurements.

If you ordered the part probe during the original build of the machine it is located in the tool library where manual tools are stored. However, it must be calibrated before using it to set up your work offsets.

Fryer Part Probe Calibration

1. To set up a new FRYER probe in the tool table, it needs to be in the manual tool location in the library. It is important to remember your probe is wired which is manually inserted and removed the tool from the spindle.

2. Define the tool as a 3D probe. When adding the new tool, you will need to press the other button to access the 3D tool option. It is important that you fill out the correct tool diameter.

3. Load the probe into the spindle. Make sure the control recognizes the probe.

4. A ring gage is required for this next step. (A 2” diameter gage is recommended).

5. If a different diameter is required, change parameter MD51770 to change diameter dimension. Refer to Section 4.1 for directions to access parameter screens.

6. Mount the gage to the machine table and use an indicator to find the center of the gage.

7. Once in the center, set a work offset in the middle. Make sure the offset is called up in the control.

8. Position the part probe at X and Y zero (middle of the gage). The Z axis should be roughly ¼” below the top of the ring gage.

9. Select WORKP. ZERO

10. Select CALIBRATE PROBE

11. Select DIAMETER. The diameter value must equal the diameter of your gage.

12. Press CYCLE START. Once complete the probe should be calibrated in the X and Y axis.

13. At this point the part probe is calibrated and ready for use.

14. Remove the ring gage and store it in a safe place.
3.3 BASIC MACHINE PROCEDURES

3.3.1 Setting Axes Home Positions

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

The 828 control comes standard with absolute encoders which generally do not require homing. However, if you have an issue with the battery or the machine is not turned on for an extended length of time the machine may need to be re-homed according to the following procedure. In addition, if an axis motor is removed or there is an issue with a motor coupling or pulley / belt assembly, one or more axes may need to be re-homed.

- Refer to Section 4.1 for directions to access parameter screens.

1. Press **MENU SELECT**
2. Select **SETUP**
3. Select **MACHINE DATA**
4. Select **AXIS MD**
5. Select **SEARCH**
6. Enter $34210 \[0\]$ in the search field (This will read **ENC_REFP_STATE**)
7. Select **OK**
8. Select the proper axis with the **AXIS + AND AXIS –**
9. Change the parameter $34210 \[0\]$ to 0 for an axis with a motor encoder
10. Change the parameters $34210 \[0\]$ and $34210 \[1\]$ to 0 for an axis with a scale
11. Press **INPUT**
12. Cycle power to machine leaving it off for a minimum of 30 seconds
13. **Take extreme caution now as the machine can be crashed!**
14. Line up the home markers for all axes that need to be homed
15. Press the **E-STOP** button to turn off the servos
16. Press **MENU SELECT**
17. Select **SETUP**
18. Select **MACHINE DATA**
19. Select **AXIS MD**
20. Select **SEARCH**
21. Enter $34210 \[0\]$ in the search field (This will read **ENC_REFP_STATE**)
22. Select **OK**
23. Select the proper axis with the **AXIS + AND AXIS –**
24. Make sure Parameter $34210 \[0\]$ and $34210 \[1\]$ (if axis has a scale) are set to 0. If it is not, it is probable that the wrong axis is selected.
25. Change the parameter $34210 \[0\]$ to 1 for an axis with a motor encoder
26. Change the parameters $34210 \[0\]$ and $34210 \[1\]$ to 1 for an axis with a scale
27. Press **INPUT**
28. Turn the feed rate override all the way down
29. Pull the **E-Stop** button out
30. Select **RESET**
31. Press **HOME RETURN** (should say Jog Ref at the top of the screen)
32. For a mill, press **AXIS+** (refers to the hard key on the manual panel you have selected)
33. When done make sure parameter 34210 [0] shows 2 for all axes (axis with motor encoder)
34. When done make sure parameter 34210 [0] and parameter 34210 [1] shows 2 for all axes (axis with scale)

### 3.3.2 Check Axis Backlash

**Tools Required:** 0.0001” resolution dial indicator, remote handwheel (manual pulse generator)

- Set the indicator along the axis which is being measured. The needle should be in contact with a flat machined surface and the base on a stable, fixed point. See the pictures below which illustrate the setup for the X, Y, and Z axes.
- Using the remote handwheel, move the axis in one direction either positive or negative until the indicator is loaded by 0.002”.
- Zero the indicator.
- Move the axis in the same direction by 0.005”.
- Reverse the direction of the axis by 0.005”.
- The additional amount that is needed to reach zero after the 0.005” reverse in direction is the backlash measured.
- This shows the loss of motion in the axis from the ballscrew and linear guide rails. Backlash compensation can be adjusted according to the procedure outlined below in Section 3.33.

![X-Axis](image1)
![Y-Axis](image2)
![Z-Axis](image3)
3.33 Adjusting Backlash Compensation

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

- Refer to Section 4.1 for directions to access parameter screens.
  - Press MENU SELECT
  - Select SETUP
  - Select MACHINE DATA
  - Select AXIS MD
  - Using AXIS+ AND AXIS-, select the correct axis
  - Select SEARCH
  - Enter 32450 [0] or 32450 [1] if the machine is equipped with glass scales on the selected axis
  - Adjust the backlash on each axis
  - Select SET MD ACTIVE (cf)
  - Select RESET (po) to reboot the control

3.34 Working With Waycovers

- When working with steel waycovers, several precautions must be taken:
  - Do not put excessive weight on the waycovers (50lbs. max.)
  - Protective gloves should be worn while handling waycovers, as the metal edges can be sharp.
  - Covers should be cleaned regularly to avoid any build-up of chips or debris. It is recommended that the underside of the covers be thoroughly cleaned at least every 6 months.

To remove the waycovers for service:

- Jog the axis being worked on so that the cover to be removed is in the fully compressed position.
- Next, remove the cap head screws attaching the cover to the moving axis and to the waycover standoff (if applicable).
- The waycover can now be removed by simply pulling it off the way surface.

To check waycovers for wear and/or damage:

- Make sure the covers slide open and closed freely and that there are no dents or visible damage that would impair free movement of the covers.
- Inspect the plastic sliders and rubber bumpers under the waycover to make sure they are in place and not damaged or worn.

To reinstall the waycovers on the machine:

- Slide the cover on the appropriate way surface making sure that it is clear of debris.
- Insert the cap head screws to the moving axis and the standoffs (if applicable) and hand tighten only.
- To properly align the waycover, jog the axis to the position where the waycover is in full extension, and then full compression.
- With the waycover fully compressed, all cap head screws can now be tightened.
- Run the axis back and forth slowing over full travel check for any visual signs of misalignment.
- Now rapid the axis back and forth over full travel again check for any signs of misalignment.
3.35 Check / Adjusting Ballscrew Endplay

* It is important to read and understand the procedure 3.34 Working with Waycovers, before executing this procedure.

- **Tools Required:** 0.0001" resolution dial indicator, remote handwheel (manual pulse generator), metric allen key set, spanner wrench.

- **Check Endplay:** You will need to access the pulley end of the ballscrew for the axis being worked on. To do this, remove the left side waycover and the belt cover for the X-axis. Remove the front waycover and belt cover for the Y-axis. The top end of the z-axis ballscrew is accessible by just moving the head down. Place a dial indicator needle on the end of the ballscrew. Load and zero the indicator appropriately. Using the remote handwheel set to x100 for the appropriate axis, change axis direction back and forth and observe any axial motion shown on the indicator. Endplay should be no more than .0001". This can also be accomplished by jogging each axis using the manual panel buttons or manually by using an allen wrench on the end of the ballscrew.

- **Adjusting Endplay:** If ballscrew endplay is greater than 0.0001", it must be adjusted. To do so, loosen the 3 set screws on the ballscrew spanner nut adjacent to the motor coupling. Using a spanner wrench, tighten the nut. The ballscrew will have to be held stationary with an allen key on the opposite end. Tighten the set screws and recheck the endplay. Repeat the tightening procedure if necessary. Once the ballscrew endplay is .0001" or less, re-install any sheet metal or motor covers and re-install the waycover(s) as applicable.

3.36 Check Axis Motor Belts

- The axis motors are connected to the ballscrews via pulley driven belts. Belts should be checked for excessive wear and proper tension at least every 6 months.

- To access the belts, remove left side belt cover for the X-axis and the front belt cover for the Y-axis.

- The Z-axis belt is located on the top of the column

- Once you have gained access to the belts, inspect them for any visible signs or wear or damage. Once the belts are considered acceptable, check each belt for proper tension.

- Belt tension is adjusted by loosening the slotted motor plate and sliding the motor-plate assembly to tighten or loosen the belt as required. Double check all hardware is properly tightened once the belt tension is correct.

- After the inspection is complete and any adjustments made, re-install the belt covers.
4.0 2300 CONTROL

4.1 ACCESSING MACHINE PARAMETERS

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

![WARNING]

Malfunctions of the machine as a result of incorrect or changed parameter settings
As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.
- Protect the parameterization (parameter assignments) against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

1. Press MENU SELECT
2. Select SETUP
3. Select MACHINE DATA
4. Available folders: GENERAL MD / CHANNEL MD / AXIS MD

4.2 ACCESSING THE SOFTWARE VERSION

To find out the version of the software you are running on your 828 control:

1. Press MENU SELECT
2. Select DIAGNOSIS
3. Select VERSION
4. The Software Version number is on the first line and will read: “V##.## + SP ## + HF ##”

4.3 REVERT TO THE FACTORY SET PASSWORD

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

1. Press MENU SELECT
2. Select SETUP
3. Select SET PASSWORD
4. Enter the password: SUNRISE
5. Press OK
6. The lower part of the screen should now read “Current Access Level: Manufacturer”
4.4 ADJUSTING INPUT VOLTAGE PARAMETERS

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

The Siemens control will shut itself off if the line voltage is more than 10% different than the voltage set in the control. You must adjust the parameter to match your line voltage to the machine.

The first step to accurately measure your line voltage. There are two ways to do this.

- Measure the incoming line voltage across all three legs with a voltmeter. Average your readings and write down the value.
  
  - OR -
  
- Read the line voltage from the control, follow the following steps:
  
  - MENU SELECT key
  - SETUP key
  - INFEED PARAMETER key
  - Find r25[0] = and write down the voltage value in this parameter.

- Now you have the proper line voltage value to enter in the control. Follow the steps below:

  - Press E-stop
  - MENU SELECT key
  - SETUP key
  - Press Å (up arrow hard key next to machine hard key)
  - DRIVE SYSTEM key
  - SUPPLY key
  - POWER DATA key See screen below:

  ![Screen shot showing Device Supply Voltage and other options]

  - Scroll down to the Device Supply Voltage field like in the screen shot above. Enter the line voltage value you obtained in the previous steps, press enter
  - Press ACCEPT key
  - There will be a message that states, “Confirm You Want to Change the Parameter”, Press YES key to accept the change
4.5 M-CODES

An M code in CNC programming controls miscellaneous machine functions, including starting and stopping specific actions or programs.

- **M00** PROGRAM STOP
- **M01** OPTIONAL PROGRAM STOP
- **M02** END OF PROGRAM
- **M03** SPINDLE CLOCKWISE
- **M04** SPINDLE COUNTERCLOCKWISE
- **M05** SPINDLE STOP
- **M06** TOOL CHANGE REQUESTED
- **M07** MIST COOLANT / AIR BLAST ON
- **M08** FLOOD COOLANT
- **M09** COOLANT (FLOOD AND MIST / AIR BLAST) OFF
- **M10** INDEXER CYCLE START WAIT FOR COMPLETION
- **M11** MISC. MCODE M11=ON
- **M12** MISC. MCODE M12=OFF
- **M13** A AXIS BRAKE ON
- **M14** A AXIS BRAKE OFF
- **M17** END OF MACRO PROGRAM
- **M19** SPINDLE ORIENT
- **M23** 2ND PROGRAMMABLE AIR BLAST ON
- **M24** 2ND PROGRAMMABLE AIR BLAST OFF
- **M25** TURNS ON PART PROBE (MARPOSS / RENISHAW)
- **M26** TURNS OFF PART/TOOL PROBE (MARPOSS / RENISHAW)
- **M27** TURNS ON TOOL PROBE (MARPOSS / RENISHAW)
- **M30** END OF PROGRAM
- **M52** ATC CAROUSEL IN
- **M53** ATC CAROUSEL OUT
- **M54** DRAWBAR ON
- **M55** DRAWBAR OFF
- **M58** ATC CAROUSEL CW 1 POSITION
- **M59** ATC CAROUSEL CCW 1 POSITION
- **M61** HOME ATC CAROUSEL TO POCKET 1, ASSUMES TOOL 0 IN SPINDLE

Note: M-codes may change depending on options the machine is equipped with.
4.6 ALARMS

An alarm will be displayed once a fault occurs.

⚠️ Warning: If you do not heed an alarm that is issued and do not resolve the cause of the alarm, it can present a hazard to the machine, the work piece, the saved settings, and in certain circumstances, may cause injury.

4.61 Siemens Alarms

1. If a familiar alarm number / description appears carefully check the machine and resolve the cause of the alarm.
2. If you are unfamiliar with the alarm in question, proceed to the alarm list as follows:
   a. Press MENU SELECT
   b. Select DIAGNOSTICS
   c. Select ALARM LIST
3. *Once “ALARM LIST” has been selected, press HELP key and additional information will be provided on the control screen.

4.62 Fryer PLC Alarms and Descriptions

There are certain PLC alarms in the 700000 range which are not in the HELP screen. These are FRYER Machine specific alarms that are for optional equipment installed on the machine. The alarms are listed below:

- 700000 ATC CAROUSEL NOT REFERENCED: EXECUTE M61
- 700001 LOW WAY LUBE [I32.6]
- 700002 LOW AIR PRESSURE [I32.2]
- 700003 HOME REQUIRED! PRESS CYCLE START
- 700004 PROBE ERROR / SIGNAL LOSS
- 700005 GEAR CHANGE FAULT
- 700006 SPINDLE OUT OF GEAR
- 700008 CHILLER FAULT
- 700009 HYDRAULIC PRESSURE FAULT
- 700011 THRU SPINDLE COOLANT FAULT, CHECK COOLANT SUPPLY
- 700013 EMERGENCY STOP Pressed during tool change
- 700014 COUNTER-BALANCE CYLINDER PRESSURE LOW!
- 700015 ATC CAROUSEL TIMED OUT-CHECK THERMAL MCCAR
- 700016 CAROUSEL CANNOT INDEX POT NOT RETRACTED
- 700024 M52-TOOL POT DOWN TIMED OUT
- 700025 M53-TOOL POT UP TIMED OUT
- 700026 M69 CAUSED SERVO OFF
- 700027 M62 TIMED OUT CHECK TC HEIGHT, ORIENT, THERMAL MCATC
- 700028 M63 TIMED OUT CHECK THERMAL MCATC
- 700029 M54 DRAWBAR ON TIMED OUT
- 700030 M55 DRAWBAR OFF TIMED OUT
- 700032 CONTOUR HANDWHEEL ACTIVE
- 700033 Z MOTION AND ATC ARM NOT AT HOME POSITION
- 700034 RESET SUPPRESSED UNTIL TOOL CHANGE COMPLETION
- 700035 HOME RETURN: DEPRESS CYCLE START
- 700037 REPLACE PROBE BATTERY
- 700038 TOOL SETTER ACTIVE
- 700039 PART PROBE ACTIVE
- 700040 WAY OILER PRESSURE FAULT
- 700041 DOOR IS OPEN ~ CLOSE DOOR; PRESS CYCLE START TO CONTINUE
4.63 Clearing an Alarm

1. Carefully check the machine according to the description given in the alarm. Clarification of the alarm codes can be found by using the HELP as described above.
2. Resolve the cause of the alarm.
3. Press RESET
4. Certain alarms will require a reboot of the control to clear.

4.7 WORKING WITH FILES

4.71 File Types

- NC archive contains the machine PARAMETERS
- PLC archive contains the LADDER LOGIC for the machine functions
- DRV archive contains the AXIS DRIVE SETTINGS

4.72 Back-Up An 2300 Archive File to A USB Stick

For a download of the machine archive to a USB, press these three keys at the same time on the control:

CTRL + ALT + S

This will create a complete standard Easy Archive (.ARC) on a USB.

If a specific file or additional files need to be backed up to a USB, do the following:

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

1. Select the MENU SELECT.
2. Select the STARTUP.
3. Press the SYSTEM DATA key. The data tree will open.
   i. In the data tree, select the required files from which you want to generate an archive.
4. Press the ARCHIVE and GENERATE ARCHIVE keys.
5. The GENERATE ARCHIVE: SELECT STORAGE LOCATION window opens. Select the USB location for archiving.
6. Save the file as serial number of machine and the file name (i.e., for drive archive: “25123DRV”)
7. Enter a name and press the OK key. The directory is created below the selected folder.
8. Press the OK key.
9. Select the format archive ARC for 840, enter the desired name and press the OK key to archive the file/files.
   a. A message informs you if archiving was successful.
10. Press the OK key to confirm.
11. An archive file in the .ARC (840) format type is created in the selected directory.

*Note: When backing up an entire machine you should generate an individual file for NC, PLC, Drive, and HMI. When that step is completed, you should generate an archive for all these together.
4.73 Reloading an Archive File

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

NOTE: Set the password protection to “Current Access Level: Manufacturer”. Refer to Section 4.3 above.

1. Select the PROGRAM MANAGER key.
2. Press the ARCHIVE and READ IN ARCHIVE keys.
3. Select the archive storage location (i.e., USB) and position the cursor on the required archive.
4. Note: When the option is not set, the folder for user archives is only displayed if the folder contains at least one archive.
   OR
5. Press the SEARCH key and in the search dialog, enter the name of the archive file with file extension ARC if you wish to search for a specific archive and press the OK key.
6. Press the OK or OVERWRITE ALL key to overwrite existing files.
   OR
7. Press the DO NOT OVERWRITE key if you do not want to overwrite already existing files.
   OR
8. Press the SKIP key if the read-in operation is to be continued with the next file.
9. The READ IN ARCHIVE window opens and a progress message box appears for the read-in process.
10. You will then obtain a READ ERROR LOG FOR ARCHIVE in which the skipped or overwritten files are listed.
11. Press the CANCEL key to cancel the read-in process.
   *Note: You may only archive one file at a time.

4.74 Backing Up Tool Data on the 2300 Control

Note: Setup data from part programs can only be backed up if they have been saved in the WORKPIECES directory. For part programs, which are located in the PART PROGRAMS directory, SAVE SETUP DATA is not listed.

1. Select the PROGRAM MANAGER operating area.
2. Position the cursor on the program whose tool and zero-point data you wish to back up.
3. Press the >> and ARCHIVE keys.
4. Press the SETUP DATA key.
5. The BACKUP SETUP DATA window opens. Select the data you want to back up.
6. Change the specified name of the originally selected program in the FILE NAME field, if needed.
7. Press the OK key.
8. The setup data will be set up in the same directory in which the selected program is stored as an INI file.
When you receive your machine all license numbers applicable to your order are activated prior to the machine leaving the factory. If you purchase a control option after the machine arrives at your facility you will receive a license number to active on your control. The license will either require you to go online and create a new license key, or this will be already done for you. If you receive a license certificate like pictured in figure one go to step 1, if not and you already have a license (see figure 2) then proceed to step 8.

1. You need to obtain the hardware serial # (this not the same as the control serial number) follow these steps:
   - Press MENU SELECT
   - Press SETUP
   - Select LICENSE (you may have to press the ^ or > key to see the soft key)
   - Record the CF CARD SERIAL #
   This number can also be found in the CF card located in your electrical cabinet. The number on the card is labeled as CFC SN. CAUTION: Machine must be powered down before the card is removed.

2. Once you have obtained your Control Hardware Serial Number you are ready to activate your new license number. Using the internet, log onto: www.Siemens.com/Automation/License
   - Click on the link for DIRECT ACCESS
   - Enter the LICENSE # AND DISPATCH NOTE # from the paperwork into the areas indicated on the web page.

3. Click NEXT
4. On the next screen enter your hardware serial number.
5. Next select the control model. Your machine has a 840D.
6. The system will now return a software license key
7. Download PDF and save for your records. Also print the PDF so you can refer to it at the machine to type in new license key.
8. Already have printed license see below:
9. Follow step 1 to get to the license screen. Type in (overwriting old license key) current license key and press input. The field is highlighted, make sure to enter correctly.

10. Press all options soft key

11. Search for the particular option you want to activate. Set the box with the select key. See figure 4.

12. Press back soft key and power machine down. When you turn the machine back on the option should be activated.
4.9 SET UP THE NETWORK DRIVE IN THE 2300

**NOTE:** It is recommended that this procedure be performed by an experienced network administrator.

The transfer of programs can be achieved by mapping a soft-key to a networked computer. The soft key will appear in the Program Manager screen of the controller.

The computer connected to the network must be configured with a unique username and password. This information will be required for inputting on the controller. A dedicated shared folder is required on the PC for the storage of files.

- Refer to Section 4.1 for directions to access parameter screens.

1. Press **MENU SELECT**
2. Select **SETUP**
3. Select **START-UP**
4. Press the **HMI** and **LOG. DRIVE** keys. The **SET UP DRIVES** window opens.
5. Select the open key that you want to configure (example #5).
6. To allow entry fields to be edited, press the **CHANGE** key.
7. Select the data for the corresponding drive or enter the necessary data.
8. Press the **OK** key. The entries are checked. A window with the appropriate message opens if the data is incomplete or incorrect. Acknowledge the message with **OK** key. If you press the **CANCEL** key, then all of the data that has not been activated is rejected.

9. Restart the control in order to activate the configuration and to obtain the keys in the **PROGRAM MANAGER** screen.
5.0 ATC OPERATION

5.1 CAROUSEL TYPE ATC OPERATION

5.11 Safety Rules -- READ BEFORE OPERATING ATC

CAUTION! Always follow all Lock Out Tag Out procedures before performing any maintenance

- Due to the complexity and timing of the ATC, it should only be operated with the M6 command.

- *Never interrupt the tool changer in the middle of cycle, wait for it to complete the tool change.*

- The carousel motor is a 3-phase motor and must be phased correctly for proper direction. The machine is phased properly at the factory before shipment, so if the carousel rotates in the wrong direction, switch any two incoming power wires at the disconnect. *Make sure the main power breaker is off!*

- M58 moves carousel position CW one position, M59 moves carousel position CCW one position.

- If the T code is programmed on the same line as the M6 command, make sure the M6 is before the T code (example: M6T4).

5.12 Manual Operation of the Tool Changer

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

The following is the process to manually step through the tool change operation in MDI.

**NOTE:** *Make sure you follow these steps in sequence to prevent damage to the ATC or machine.*

The proper sequence of a tool change and the respective M-codes are as follows:

1. T-code executes to move carousel to pending tool.
3. G75 FP=2 Z0, moves z axis to tool change clearance position. (Tool change clearance position is stored in Axis MD Z1 parameter 30600 – FIX_POINT_POS[1].)
5. M54 - Drawbar open to unclamp tool.
6. G75 FP=1 Z0, moves z axis to tool change height position. (Tool change height position is stored in Axis MD Z1 parameter 30600 – FIX_POINT_POS[0].)
7. M55 Drawbar close to clamp tool in spindle.
8. M53 Tool change carousel out position.
5.13 Setting Tool Change Height

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

The proper tool change height must be set for the ATC to perform correctly. The tool change height (machine coordinates from home position) is stored in parameter MD30600.

**NOTE:** To manually get the tool grab fingers of a carousel style ATC under the spindle you will need to disconnect the air from the machine and manually push the carousel toward the spindle. With the air disconnected you will be able to move the carousel in and out by hand.

- Refer to Section 4.1 for directions to access parameter screens.

1. Press **MENU SELECT**
2. Select **SETUP**
3. Select **MACHINE DATA**
4. Select **GENERAL MD**

**Caution!** Take extreme care as changing these parameters will defeat built in safeties for TC collision!

5. Select **SEARCH**
6. Type in **14512**
7. Select **OK**
8. There will be multiple **14512** parameters
   - **14512 [2]** is for carousel tool changers
9. You need to make a change to this parameter to turn the tool changer off
   - For carousel style tool changers subtract 1 from the current value
10. Cycle power to the machine leaving it off for at least 30 seconds
11. Insert a tool in the spindle
12. Now you need to get the tool grab component of the tool changer under the spindle
   - “See note above on how to do this
13. To line up the “V” profile in the tool holder with the mating profile in the arm, use the handwheel on a fine setting to carefully move the head up or down
14. Remove air from machine
15. Manually move the carousel towards the spindle so the “v” profile in the tool holder needs to line up with the mating profile in the carousel fingers
   - Use a flashlight to get this alignment as close as possible
16. If “V” profile does not match
17. Record the **Z** axis machine position
18. Complete steps 1 – 8 to get back to setting the **14512** parameter
19. You need to change this parameter back to the previously noted values
   - For carousel style tool changers add 1 to the current value
20. Select **AXIS MD**
21. Select **AXIS +** until you are on **Axis Z**
22. Select **SEARCH**
23. Type in **30600**
24. Select **OK**
25. Set **30600[0]** equal to the value that you recorded in step 15
26. Cycle power to the machine leaving it off for at least 30 seconds
27. Execute a manual tool change to verify proper function
5.14 Recovering from a Tool Change Failure

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

If the tool changer fails, you may get an alarm. This means that after 30 seconds of waiting, a function did not receive its proper finish signal. At this point, **do not E-stop or hit reset.** This can cause a tool to drop and possibly cause an injury to the operator.

- Locate the pneumatic solenoid for the carousel in/out function. You can do this by referring to the pneumatic system decal and labeled air lines.
- Once the proper solenoid is located, lock the carousel in the “in” position by pushing in the blue switch and turning it clockwise to keep it locked.
- At this point, the value of parameter 14512[2] will need to be reduced by 1. Use extreme caution as this will allow the Z-axis to move freely with the ATC in the “in” position.
- Cycle power leaving the machine off for at least 30 seconds.
- Execute an M54 (drawbar on) to unclamp the tool from the spindle.
- The Z-axis can now be moved to the positive soft limit, clearing it from the tool in the tool changer.
- The solenoid can now be unlocked, which will return the carousel to the “out” position.
- Execute an M55 (drawbar off) to clamp the tool in the spindle.
- At this point the tool bin locations are potentially compromised. Refer to Section 5.15 to reset the tool bin locations.
- If there is a tool in the spindle and in the carousel and they crash into one another, hit E-stop to send the carousel to the out position. Refer to Section 5.15 to reset the tool bin locations.

5.15 Tool Carousel HOME Position and Tool Bin# Reset

To reset all the tool bin locations, follow this procedure:

1. Remove the tool from the spindle
2. In MDI command: Type in M6T0 and press CYCLE START
3. Remove all new tools from the spindle
4. Go to command M61 to index the carousel to bin #1
5. Go to tool table and select the MAGAZINE function.
6. Select UNLOAD ALL to remove the tools from the table.
7. Now select TOOL LIST. At this point all the current tool definitions are still in the table. They moved to the bottom below the highest tool number in your carousel.
8. You can now begin loading each tool definition up to the appropriate number that matches the physical location of the tool in the carousel. Do this by selecting LOAD and selecting a location number.
5.16 Spindle Orient Adjustment

PROCEDURE TO BE PERFORMED BY QUALIFIED PERSONNEL ONLY

This procedure will outline how to adjust the spindle orient position when an M19 is commanded to perform a tool change. Read all instructions carefully and do not skip steps.

1. Put a tool in the spindle, make sure the carousel location in the load position (directly opposite the spindle) is empty.
2. In MDI clear out any previous commands and type in:
   
   G75 FP=0 Z0
   M19

3. Press CYCLE START to execute. Notice the direction the spindle goes in (Forward or Reverse)
4. Press MENU SELECT
5. DIAGNOSTICS
6. AXIS DIAG, (If you do not see key press “>” arrow key to see more buttons.
7. Press SERVICE AXIS
8. Use Axis + or Axis - key to display AX4: MSP1/3.3/SPINDLE see screen below:

   ![Screen Shot](image)

9. Press RESET and slowly turn the spindle in the direction the M19 orient command turned in step 3, until the spindle keys line up with the ATC carousel key.
10. Remove the air pressure and push the ATC carousel under the spindle make sure the spindle key is lined up. While looking at the above screen turn the spindle CW and CCW. Note the max and minimum values of the Pos. actual value measuring system 1. Calculate the average of the two values. This is the new orient position.
11. Press MENU SELECT
12. Press SETUP
13. Press MACH DATA
14. Press AXIS SD (you may have to press “>” to show additional buttons)

15. Use Axis+ until spindle axis is displayed.

16. Scroll down to parameter 43240 $SA_M19_SPOS, this is the current orient position. Add the value you obtained in step 10 and input into this field.

17. Press reset and make sure the spindle orient goes to the correct position before doing a tool change
## 6.0 – DRAWINGS & PARTS LIST
