Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

SINUMERIK documentation

The SINUMERIK documentation is organized into the following categories:

- General documentation/catalogs
- User documentation
- Manufacturer/service documentation

Additional information

You can find information on the following topics at the following address (<https://support.industry.siemens.com/cs/de/en/view/108464614>):

- Ordering documentation/overview of documentation
- Additional links to download documents
- Using documentation online (find and search in manuals/information)

If you have any questions regarding the technical documentation (e.g. suggestions, corrections), please send an e-mail to the following address (<mailto:docu.motioncontrol@siemens.com>).

mySupport/Documentation

At the following address (<https://support.industry.siemens.com/My/ww/en/documentation>), you can find information on how to create your own individual documentation based on Siemens' content, and adapt it for your own machine documentation.

Training

At the following address (<http://www.siemens.com/sitrain>), you can find information about SITRAIN (Siemens training on products, systems and solutions for automation and drives).

FAQs

You can find Frequently Asked Questions in the Service&Support pages under Product Support (<https://support.industry.siemens.com/cs/de/en/ps/faq>).

SINUMERIK

You can find information about SINUMERIK at the following address (<http://www.siemens.com/sinumerik>).

Target group

This publication is intended for:

- Programmers
- Project engineers

Benefits

With the programming manual, the target group can develop, write, test, and debug programs and software user interfaces.

Standard scope

This Programming Manual describes the functionality of the standard scope. Extensions or changes made by the machine tool manufacturer are documented by the machine tool manufacturer.

Other functions not described in this documentation might be executable in the control. This does not, however, represent an obligation to supply such functions with a new control or when servicing.

Furthermore, for the sake of clarity, this documentation does not contain all detailed information about all product types and cannot cover every conceivable case of installation, operation or maintenance.

Technical Support

Country-specific telephone numbers for technical support are provided in the Internet at the following address (<https://support.industry.siemens.com/sc/ww/en/sc/2090>) in the "Contact" area.

Information on structure and contents

Programming Manual, Fundamentals/Job Planning

The description of the NC programming is divided into two manuals:

1. Fundamentals

This "Fundamentals" Programming Manual is intended for use by skilled machine operators with the appropriate expertise in drilling, milling and turning operations. Simple programming examples are used to explain the commands and statements which are also defined according to DIN 66025.

2. Job planning

The Programming Manual "Advanced" is intended for use by technicians with in-depth, comprehensive programming knowledge. By virtue of a special programming language, the SINUMERIK control enables the user to program complex workpiece programs (e.g. for free-form surfaces, channel coordination, ...) and makes programming of complicated operations easy for technologists.

Availability of the described NC language elements

All NC language elements described in the manual are available for the SINUMERIK 840D sl.
The availability regarding SINUMERIK 828D should be taken from Table "Operations:
Availability for SINUMERIK 828D (Page 860)".

Table of contents

	Preface.....	3
1	Fundamental safety instructions.....	17
1.1	General safety instructions.....	17
1.2	Warranty and liability for application examples.....	18
1.3	Industrial security.....	19
2	Flexible NC programming.....	21
2.1	Variables.....	21
2.1.1	System data.....	21
2.1.2	Predefined user variables: Arithmetic parameters.....	24
2.1.2.1	Channel-specific arithmetic parameters (R).....	24
2.1.2.2	Global arithmetic parameters (RG).....	25
2.1.3	Predefined user variables: Link variables.....	27
2.1.4	Definition of user variables (DEF).....	29
2.1.5	Redefinition of system data, user data, and NC commands (REDEF).....	35
2.1.6	Attribute: Initialization value.....	38
2.1.7	Attribute: Limit values (LLI, ULI).....	41
2.1.8	Attribute: Physical unit (PHU).....	43
2.1.9	Attribute: Access rights (APR, APW, APRP, APWP, APRB, APWB).....	45
2.1.10	Attribute: Data class (DCM, DCI, DCU) - only SINUMERIK 828D.....	49
2.1.11	Overview of definable and redefinable attributes.....	50
2.1.12	Definition and initialization of array variables (DEF, SET, REP).....	52
2.1.13	Definition and initialization of array variables (DEF, SET, REP): Further Information.....	56
2.1.14	Data types.....	58
2.1.15	Check availability of a variable (ISVAR).....	59
2.1.16	Reading attribute values / data type (GETVARPHU, GETVARAP, GETVARLIM, GETVARDIM, GETVARDFT, GETVARTYP).....	60
2.2	Indirect programming.....	66
2.2.1	Indirectly programming addresses.....	66
2.2.2	Indirectly programming G commands.....	68
2.2.3	Indirectly programming position attributes (GP).....	69
2.2.4	Indirectly programming part program lines (EXECSTRING).....	72
2.3	Arithmetic functions.....	73
2.4	Comparison and logic operations.....	76
2.5	Precision correction on comparison errors (TRUNC).....	78
2.6	Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND).....	80
2.7	Priority of the operations.....	82
2.8	Possible type conversions.....	83
2.9	String operations.....	84
2.9.1	Type conversion to STRING (AXSTRING).....	84

2.9.2	Type conversion from STRING (NUMBER, ISNUMBER, AXNAME).....	85
2.9.3	Concatenation of strings (<<).....	86
2.9.4	Conversion to lower/upper case letters (TOLOWER, TOUPPER).....	87
2.9.5	Determine length of string (STRLEN).....	88
2.9.6	Search for character/string in the string (INDEX, RINDEX, MINDEX, MATCH).....	89
2.9.7	Selection of a substring (SUBSTR).....	90
2.9.8	Reading and writing of individual characters.....	91
2.9.9	Formatting a string (SPRINT).....	92
2.10	Program jumps and branches.....	101
2.10.1	Return jump to the start of the program (GOTOS).....	101
2.10.2	Program jumps to jump markers (GOTOB, GOTO, GOTO, GOTOC).....	102
2.10.3	Program branch (CASE ... OF ... DEFAULT ...)	105
2.11	Repeat program section (REPEAT, REPEATB, ENDLABEL, P).....	107
2.12	Check structures.....	113
2.12.1	Conditional statement and branch (IF, ELSE, ENDIF).....	114
2.12.2	Continuous program loop (LOOP, ENDLOOP).....	116
2.12.3	Count loop (FOR ... TO ..., ENDFOR).....	116
2.12.4	Program loop with condition at start of loop (WHILE, ENDWHILE).....	118
2.12.5	Program loop with condition at the end of the loop (REPEAT, UNTIL).....	118
2.12.6	Program example with nested check structures.....	119
2.13	Coordination commands (INIT, START, WAITM, WAITMC, WAITE, SETM, CLEARM).....	120
2.14	Interrupt routine (ASUB).....	125
2.14.1	Function of an interrupt routine.....	125
2.14.2	Creating an interrupt routine.....	126
2.14.3	Assign and start interrupt routine (SETINT, PRIO, BLSYNC).....	127
2.14.4	Deactivating/reactivating the assignment of an interrupt routine (DISABLE, ENABLE).....	129
2.14.5	Delete assignment of interrupt routine (CLRINT).....	129
2.14.6	Fast retraction from the contour (SETINT LIFTFAST, ALF).....	130
2.14.7	Traversing direction for fast retraction from the contour	132
2.14.8	Motion sequence for interrupt routines.....	135
2.15	Axis replacement, spindle replacement (RELEASE, GET, GETD).....	137
2.16	Transfer axis to another channel (AXTOCHAN).....	142
2.17	Activate machine data (NEWCONF).....	144
2.18	Write file (WRITE).....	145
2.19	Delete file (DELETE).....	149
2.20	Read lines in the file (READ).....	150
2.21	Check for presence of file (ISFILE).....	152
2.22	Read out file information (FILEDATE, FILETIME, FILESIZE, FILESTAT, FILEINFO).....	153
2.23	Roundup (ROUNDUP).....	155
2.24	Subprogram technique.....	156
2.24.1	General information.....	156
2.24.1.1	Subprogram.....	156
2.24.1.2	Subprogram names.....	157
2.24.1.3	Nesting of subprograms.....	158
2.24.1.4	Search path.....	159

2.24.1.5	Formal and actual parameters.....	159
2.24.1.6	Parameter transfer.....	160
2.24.2	Definition of a subprogram.....	162
2.24.2.1	Subprogram without parameter transfer.....	162
2.24.2.2	Subprogram with call-by-value parameter transfer (PROC).....	162
2.24.2.3	Subprogram with call-by-reference parameter transfer (PROC, VAR).....	164
2.24.2.4	Save modal G functions (SAVE).....	166
2.24.2.5	Suppress single block execution (SBLOF, SBLON).....	167
2.24.2.6	Suppress current block display (DISPLOF, DISPLON, ACTBLOCNO).....	173
2.24.2.7	Identifying subprograms with preparation (PREPRO).....	176
2.24.2.8	Subprogram return M17.....	176
2.24.2.9	RET subprogram return.....	177
2.24.2.10	Parameterizable subprogram return jump (RET ...).....	178
2.24.2.11	Parameterizable subprogram return jump (RETB ...).....	185
2.24.3	Subprogram call.....	189
2.24.3.1	Subprogram call without parameter transfer.....	189
2.24.3.2	Subprogram call with parameter transfer (EXTERN).....	191
2.24.3.3	Number of program repetitions (P).....	193
2.24.3.4	Modal subprogram call (MCALL).....	194
2.24.3.5	Indirect subprogram call (CALL).....	196
2.24.3.6	Indirect subprogram call with specification of the calling program part (CALL BLOCK ... TO ...).....	197
2.24.3.7	Indirect call of a program programmed in ISO language (ISOCALL).....	198
2.24.3.8	Call subprogram with path specification and parameters (PCALL).....	199
2.24.3.9	Extend search path for subprogram calls (CALLPATH).....	200
2.24.3.10	Execute external subprogram (840D sl) (EXTCALL).....	201
2.24.3.11	Execute external subprogram (828D) (EXTCALL).....	204
2.25	Macro technique (DEFINE ... AS).....	209
3	File and Program Management.....	213
3.1	Program memory.....	213
3.1.1	NC program memory.....	213
3.1.2	External program memory.....	215
3.1.3	Addressing program memory files.....	217
3.1.4	Search path for subprogram call.....	221
3.1.5	Interrogating the path and file name.....	222
3.2	Working memory (CHANDATA, COMPLETE, INITIAL).....	224
4	Protection zones.....	227
4.1	Defining protection zones (CPROTDEF, NPROTDEF).....	227
4.2	Activating/deactivating protection zones (CPROT, NPROT).....	231
4.3	Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI).....	235
5	Special motion commands.....	245
5.1	Approaching coded positions (CAC, CIC, CDC, CACP, CACN).....	245
5.2	Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL).....	246
5.3	Spline group (SPLINEPATH).....	257

5.4	Activating/deactivating NC block compression (COMPON, COMPCURV, COMPCAD, COMPSURF, COMPOF).....	259
5.5	Polynomial interpolation (POLY, POLYPATH, PO, PL).....	260
5.6	Settable path reference (SPATH, UPATH).....	266
5.7	Measuring with touch-trigger probe (MEAS, MEAW).....	268
5.8	Axis-specific measurement (MEASA, MEAWA, MEAC) (option).....	271
5.9	Special functions for OEM users (OMA1 ... OMA5, OEMIPO1, OEMIPO2, G810 ... G829)....	282
5.10	Feedrate reduction with corner deceleration (FENDNORM, G62, G621)	283
5.11	Programmable end of motion criteria (FINEA, COARSEA, IPOENDA, IPOBRKA, ADISPOSA).....	284
6	Coordinate transformations (frames).....	287
6.1	Coordinate transformation via frame variables.....	287
6.1.1	Predefined frame variable (\$P_CHBFRAME, \$P_IFRAME, \$P_PFRAME, \$P_ACTFRAME).....	289
6.2	Value assignments to frames.....	293
6.2.1	Assigning direct values (axis value, angle, scale).....	293
6.2.2	Reading and changing frame components (TR, FI, RT, SC, MI).....	295
6.2.3	Calculating with frames.....	296
6.2.4	Definition of frame variables (DEF FRAME).....	297
6.3	Coarse and fine offsets (CTRANS, CFINE).....	299
6.4	External zero offset (\$AA_ETRANS).....	301
6.5	Set actual value with loss of the referencing status (PRESETON).....	303
6.6	Set actual value without loss of the referencing status (PRESETONS).....	305
6.7	Frame calculation from three measuring points in space (MEAFRAME).....	307
6.8	NCU global frames.....	311
6.8.1	Channel-specific frames (\$P_CHBFR, \$P_UBFR).....	311
6.8.2	Frames active in the channel.....	312
7	Transformations.....	317
7.1	General programming of transformation types.....	317
7.1.1	Orientation movements for transformations.....	319
7.1.2	Overview of orientation transformation TRAORI.....	323
7.2	Three, four and five axis transformation (TRAORI).....	325
7.2.1	General relationships of universal tool head.....	325
7.2.2	Three, four and five axis transformation (TRAORI).....	328
7.2.3	Variants of orientation programming and initial setting (ORIRESET).....	329
7.2.4	Programming the tool orientation (A..., B..., C..., LEAD, TILT).....	331
7.2.5	Face milling (A4, B4, C4, A5, B5, C5).....	337
7.2.6	Reference of the orientation axes (ORIWKS, ORIMKS):.....	338
7.2.7	Programming orientation axes (ORIAxes, ORIVect, ORIEuler, ORIRPY, ORIRPY2, ORIVIRT1, ORIVIRT2).....	340
7.2.8	Orientation programming along the peripheral surface of a taper (ORIPLANE, ORICONCW, ORICONCCW, ORICONTO, ORICONIO).....	342

7.2.9	Specification of orientation for two contact points (ORICURVE, PO[XH]=, PO[YH]=, PO[ZH]=).....	345
7.3	Orientation polynomials (PO[angle], PO[coordinate]).....	348
7.4	Rotations of the tool orientation (ORIOTA, ORIOTR, ORIOTT, ORIOTC, THETA)....	350
7.5	Orientations relative to the path.....	353
7.5.1	Orientation types relative to the path.....	353
7.5.2	Rotation of the tool orientation relative to the path (ORIPATH, ORIPATHS, angle of rotation).....	354
7.5.3	Interpolation of the tool rotation relative to the path (ORIOTC, THETA).....	355
7.5.4	Smoothing of orientation characteristic (ORIPATHS A8=, B8=, C8=).....	357
7.6	Compression of the orientation (COMPON, COMPCURV, COMPCAD, COMPSURF).....	359
7.7	Activating/deactivating the orientation characteristic (ORISON, ORISOF).....	362
7.8	Kinematic transformation.....	364
7.8.1	Activate face end transformation (TRANSMIT).....	364
7.8.2	Activate cylinder surface transformation (TRACYL).....	364
7.8.3	Activating an oblique angle transformation with programmable angle (TRAANG).....	367
7.8.4	Oblique plunge-cutting on grinding machines (G5, G7).....	368
7.9	Activate concatenated transformation (TRACON).....	370
7.10	Cartesian PTP travel.....	372
7.10.1	Activating/deactivating Cartesian PTP travel (PTP, PTPG0, PTPWOC, CP).....	372
7.10.2	Specify the position of the joints (STAT).....	373
7.10.3	Specify the sign of the axis angle (TU).....	377
7.10.4	Example 1: PTP travel of a 6-axis robot with ROBX transformation.....	380
7.10.5	Example 2: PTP travel for generic 5-axis transformation.....	381
7.10.6	Example 3: PTPG0 and TRANSMIT.....	381
7.11	Constraints when selecting a transformation.....	383
7.12	Deselecting a transformation (TRAFOOF).....	384
8	Kinematic chains.....	385
8.1	Deletion of components (DELOBJ).....	385
8.2	Index determination by means of names (NAMETOINT).....	388
9	Collision avoidance with kinematic chains.....	389
9.1	Check for collision pair (COLLPAIR).....	390
9.2	Request recalculation of the machine model of the collision avoidance (PROTA).....	391
9.3	Setting the protection zone status (PROTS).....	392
9.4	Determining the clearance of two protection zones (PROTD).....	393
10	Transformation with kinematic chains.....	395
10.1	Activating a transformation (TRAFOON).....	395
10.2	Modifying the orientation transformation after the machine measurement (CORRTrafo).....	396
11	Tool offsets.....	405
11.1	Offset memory.....	405

11.2	Additive offsets.....	408
11.2.1	Selecting additive offsets (DL).....	408
11.2.2	Specify wear and setup values (\$TC_SCPxy[t,d], \$TC_ECPxy[t,d]).....	409
11.2.3	Delete additive offsets (DELDL).....	410
11.3	Special handling of tool offsets.....	412
11.3.1	Mirroring of tool lengths.....	413
11.3.2	Wear sign evaluation.....	414
11.3.3	Coordinate system of the active machining operation (TOWSTD, TOWMCS, TOWWCS, TOWBCS, TOWTCS, TOWKCS).....	415
11.3.4	Tool length and plane change.....	417
11.4	Online tool offset.....	419
11.4.1	Defining a polynomial function (FCTDEF).....	419
11.4.2	Write online tool offset continuously (PUTFTOCF).....	420
11.4.3	Write online tool offset, discrete (PUTFTOC).....	421
11.4.4	Activate/deactivate online tool offset (FTOCON/FTOCOF).....	422
11.5	3D tool radius compensation.....	423
11.5.1	Selecting 3D tool radius compensation for 3D circumferential milling (CUT3DC, CUT3DCD, ISD).....	423
11.5.2	Selecting 3D tool radius compensation for the 3D face milling (CUT3DF, CUT3DFS, CUT3DFF, CUT3DFD).....	427
11.5.3	3D circumferential milling taking into account a limitation surface (CUT3DCC, CUT3DCCD).....	432
11.6	Tool orientation (ORIC, ORID, OSOF, OSC, OSS, OSSE, ORIS, OSD, OST).....	438
11.7	Free assignment of D numbers, cutting edge numbers.....	444
11.7.1	Free assignment of D numbers, cutting edge numbers (CE address).....	444
11.7.2	Free assignment of D numbers: Checking D numbers (CHKDNO).....	444
11.7.3	Free assignment of D numbers: Rename D numbers (GETDNO, SETDNO).....	445
11.7.4	Free assignment of D numbers: Determine T number to the specified D number (GETACTTD).....	446
11.7.5	Free assignment of D numbers: Invalidate D numbers (DZERO).....	446
11.8	Toolholder kinematics.....	447
11.9	Tool length compensation for orientable toolholders (TCARR, TCOABS, TCOFR, TCOFRX, TCOFRY, TCOFRZ).....	452
11.10	Online tool length compensation (TOFFON, TOFFOF).....	455
11.11	Modification of the offset data for rotatable tools.....	458
11.11.1	Calculating orientations (ORISOLH).....	458
11.11.2	Activating the modification of the offset data for rotatable tools (CUTMOD, CUTMODK)....	466
11.12	Working with tool environments.....	473
11.12.1	Save tool environment (TOOLENV).....	473
11.12.2	Delete tool environment (DELTOOLENV).....	476
11.12.3	Read T, D and DL number (GETTENV).....	477
11.12.4	Read information about the saved tool environments (\$P_TOOLENVN, (\$P_TOOLENV)....	478
11.12.5	Read tool lengths and/or tool length components (GETTCOR).....	478
11.12.6	Change tool components (SETTCOR).....	484
11.13	Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX) ...	497

12	Path traversing behavior.....	501
12.1	Tangential control.....	501
12.1.1	Defining coupling (TANG).....	501
12.1.2	Activating intermediate block generation (TLIFT).....	502
12.1.3	Activating the coupling (TANGON).....	503
12.1.4	Deactivating the coupling (TANGOF).....	505
12.1.5	Deleting a coupling (TANGDEL).....	505
12.2	Feedrate characteristic (FNORM, FLIN, FCUB, FPO).....	507
12.3	Acceleration behavior.....	512
12.3.1	Acceleration mode (BRISK, BRISKA, SOFT, SOFTA, DRIVE, DRIVEA).....	512
12.3.2	Influence of acceleration on following axes (VELOLIMA, ACCLIMA, JERKLIMA).....	514
12.3.3	Activation of technology-specific dynamic values (DYNNORM, DYNPOS, DYNROUGH, DYNSEMIFIN, DYNFINISH).....	516
12.4	Traversing with feedforward control (FFWON, FFWOF).....	518
12.5	Programmable contour accuracy (CPRECON, CPRECOF).....	519
12.6	Program sequence with preprocessing memory (STOPFIFO, STARTFIFO, FIFOCTRL, STOPRE)	521
12.7	Defining a stop delay range (DELAYFSTON, DELAYFSTOF).....	524
12.8	Prevent program position for SERUPRO (IPTRLOCK, IPTRUNLOCK).....	527
12.9	Repositioning to the contour (REPOSA, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL)	529
12.10	Influencing the motion control.....	538
12.10.1	Percentage jerk correction (JERKLIM).....	538
12.10.2	Percentage velocity correction (VELOLIM).....	539
12.10.3	Program example for JERKLIM and VELOLIM.....	541
12.11	Programming contour/orientation tolerance (CTOL, OTOL, ATOL).....	542
12.12	Block change behavior with active coupling (CPBC).....	546
13	Axis couplings.....	547
13.1	Coupled motion (TRAILON, TRAILOF).....	547
13.2	Curve tables (CTAB).....	552
13.2.1	Define curve tables (CTABDEF, CATBEND).....	552
13.2.2	Check for presence of curve table (CTABEXISTS).....	558
13.2.3	Delete curve tables (CTABDEL).....	559
13.2.4	Locking curve tables to prevent deletion and overwriting (CTABLOCK, CTABUNLOCK).....	560
13.2.5	Curve tables: Determine table properties (CTABID, CTABISLOCK, CTABMEMTYP, CTABPERIOD).....	561

Fundamental safety instructions

1.1 General safety instructions

WARNING

Danger to life if the safety instructions and residual risks are not observed

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

1.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

1.3 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the Internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit:

Industrial security (<http://www.siemens.com/industrialsecurity>)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security (<http://www.siemens.com/industrialsecurity>)

Further information is provided on the Internet:

Industrial Security Configuration Manual (<https://support.industry.siemens.com/cs/ww/en/view/108862708>)

WARNING

Unsafe operating states resulting from software manipulation

Software manipulations (e.g. viruses, trojans, malware or worms) can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- Protect the drive against unauthorized changes by activating the "know-how protection" drive function.

Flexible NC programming

2.1 Variables

The use of variables from the areas system data and user data, especially in conjunction with arithmetic functions and check structures, enables highly flexible NC programs and cycles to be written.

- **System data**
The system data contains the variables predefined in the system. These variables have a defined meaning. They are primarily used by the system software. The user can read and write these variables in NC programs and cycles. Example: Machine data, setting data, system variables.
Although the meaning of a system data item is fixed, the user can modify its properties within certain limits by redefinition.
See "Redefinition of system data, user data, and NC commands (REDEF) (Page 35)"
- **User data**
The user data contains those variables defined by the user whose meaning is exclusively defined by the user. It is not evaluated by the system.
The user data is divided into:
 - **Predefined user variables**
Predefined user variables are variables that have already been defined in the system and whose number is parameterized in the machine data. The user can make changes to the properties of these variables.
See "Redefinition of system data, user data, and NC commands (REDEF) (Page 35)."
 - **User-defined variables**
User-defined variables are variables that are defined by the user and are not created by the system until runtime. Their number, data type, visibility, and all other properties are defined exclusively by the user.
See "Definition of user variables (DEF) (Page 29)"

2.1.1 System data

The system data contain the variables that are predefined in the system and enable access to the current parameter settings of the control, as well as to machine, control, and process states, in NC programs and cycles.

Preprocessing variables

Preprocessing variables are system data that are read and written during preprocessing, in other words, at the instant at which the block containing the variable is interpreted. Preprocessing variables do not trigger preprocessing stops.

Main run variables

Main run variables are system data that are read and written during the main run, in other words, at the instant at which the block containing the variable is executed. The following are main run variables:

- Variables that can be programmed in synchronized actions (read/write)
- Variables that can be programmed in the NC program and trigger preprocessing stops (read/write)
- Variables that can be programmed in the NC program and whose value is calculated during preprocessing but not written until the main run (main run synchronized: write only)

Prefix system

To distinguish system data from other data, their names are usually preceded by a prefix comprising the \$ sign followed by one or two letters and an underscore.

\$ + 1. Letter	Meaning: Data type
Preprocessing data (system data that are read/written during preprocessing)	
\$M	Machine data ¹⁾
\$S	Setting data, protection areas ¹⁾
\$T	Tool management data
\$P	Programmed values
\$C	Cycle variables of ISO envelope cycles
\$O	Option data
R	R-parameters (arithmetic parameters) ²⁾
Main run data (system data that are read/written during the main run)	
\$\$M	Machine data ¹⁾
\$\$S	Setting data ¹⁾
\$A	Current main run data
\$V	Position controller data
\$R	R-parameters (arithmetic parameters) ²⁾
¹⁾ Whether machine and setting data is treated as preprocessing or main run variables depends on whether they are written with one or two \$ characters. The notation is freely selectable for the specific application. ²⁾ When an R-parameter is used in the part program/cycle as a preprocessing variable, the prefix is omitted, e.g. R10. When it is used in a synchronized action as a main run variable, a \$ sign is written as a prefix, e.g. \$R10.	

2nd letter	Meaning: Visibility
N	NC global variable (NC)
C	Channel-specific variable (Channel)
A	Axis-specific variable (Axis)

Supplementary conditions

Exceptions in the prefix system

The following system of variables deviate from the prefix system specified above:

- \$TC_...: Here, the 2nd letter C does not refer to channel-specific system variables but to toolholder-specific system variables (TC= tool carrier).
- \$P_ ...: Channel-specific system variables

Use of machine and setting data in synchronized actions

When machine and setting data is used in synchronized actions, the prefix can be used to define whether the machine or setting data will be read/written synchronous to the preprocessing run or the main run.

If the data remains unchanged during machining, it can be read synchronous to the preprocessing run. For this purpose, the machine or setting data prefix is written with a \$ sign:

```
ID=1 WHENEVER $AA_IM[z] < $SA_OSCILL_REVERSE_POS2[Z]-6 DO $AA_OVR[X]=0
```

If the data changes during machining, it must be read/written synchronous to the main run. For this purpose, the machine or setting data prefix is written with two \$ signs:

```
ID=1 WHENEVER $AA_IM[z] < $$SA_OSCILL_REVERSE_POS2[Z]-6 DO $AA_OVR[X]=0
```

Note

Writing machine and setting data

When writing an item of machine or setting data, it is important to ensure that the access level which is active when the part program/cycle is executed permits write access and that the data is set to take "IMMEDIATE" effect.

References

A complete overview of all system variables appears in:

List Manual, System Variables

See also

Variables (Page 21)

2.1.2 Predefined user variables: Arithmetic parameters

2.1.2.1 Channel-specific arithmetic parameters (R)

Channel-specific arithmetic parameters or R parameters are predefined user variables with the designation R, defined as an array of the REAL data type. For historical reasons, notation both with array index, e.g. `R[10]`, and without array index, e.g. `R10`, is permitted for R parameters.

When using synchronized actions, the \$ sign must be included as a prefix, e.g. `$R10`.

Syntax

When used as a preprocessing variable:

`R<n>`

`R[<expression>]`

When used as a main run variable:

`$R<n>`

`$R[<expression>]`

Meaning

<code>R:</code>	Identifier when used as a preprocessing variable, e.g. in the part program	
<code>\$R:</code>	Identifier when used as a main run variable, e.g. in synchronized actions	
	Type:	REAL
	Range of values:	For a non-exponential notation: $\pm (0.000\ 0001 \dots 9999\ 9999)$ Note: A maximum of 8 decimal places are permitted
		For an exponential notation: $\pm (1*10^{-300} \dots 1*10^{+300})$ Note: <ul style="list-style-type: none"> Notation: <mantissa>EX<exponent> e.g. 8.2EX-3 A maximum of 10 characters are permitted including sign and decimal point.
<code><n>:</code>	Number of the R parameter	
	Type:	INT
	Range of values:	0 - MAX_INDEX Note MAX_INDEX is calculated from the parameterized number of R-parameters: <code>MAX_INDEX = (MD28050 \$MN_MM_NUM_R_PARAM) - 1</code>
<code><expression>:</code>	Array index Any expression can be used as an array index, as long as the result of the expression can be converted to the INT data type (INT, REAL, BOOL, CHAR).	

Example

Assignments to R-parameters and use of R-parameters in mathematical functions:

Program code	Comment
R0=3.5678	; Assignment in preprocessing
R[1]=-37.3	; Assignment in preprocessing
R3=-7	; Assignment in preprocessing
\$R4=-0.1EX-5	; Assignment in the main program run: $R4 = -0.1 * 10^{-5}$
\$R[6]=1.874EX8	; Assignment in the main program run: $R6 = 1.874 * 10^8$
R7=SIN(25.3)	; Assignment in preprocessing
R[R2]=R10	; Indirect addressing using R-parameter
R[(R1+R2)*R3]=5	; Indirect addressing using math. expression
X=(R1+R2)	; Traverse axis X to the position resulting from the sum of R1 and R2
Z=SQRT(R1*R1+R2*R2)	; Traverse axis Z to the square root position ($R1^2 + R2^2$)

See also

Variables (Page 21)

2.1.2.2 Global arithmetic parameters (RG)

Function

In addition to the channel-specific R parameters, the user has access to global R parameters. They exist once within the control unit and can be read and written from all channels.

Global R parameters are used, for example, to transfer information from one channel to the next. Another example concerns global settings that should be evaluated for all channels, such as the overhang of the raw part from the spindle.

The global R parameters are read and written from the user interface or in the NC program during the preprocessing. Synchronous actions and technology cycles cannot be used.

Note

No synchronization between the channels when reading and writing global R parameters.

Because the reading and writing is performed during the preprocessing, the point in time when a written value from one channel becomes active in another channel is not defined.

Example:

In channel 1, a loop runs with a global R parameter as loop counter. Channel 2 writes a value to this global R parameter; this causes a loop abort in channel 1. All loops that can be interpreted in the preprocessing in channel 1 are however still executed. The number of loops is not defined and depends on the channel loading, etc.

The user must implement a synchronization between the channels as application, e.g. with WAIT flags!

Syntax

Writing in the NC program

```
RG[<n>]=<value>
```

```
RG[<expression>]=<value>
```

Reading in the NC program

```
R...=RG[<n>]
```

```
R...=RG[<expression>]
```

Meaning

RG :	Default name of the NC address for global R parameters Note: The name of the NC address can be set via MD15800 \$MN_R_PAR-AM_NCK_NAME	
<n>:	Number of the global R parameter	
	Type:	INT
	Range of values:	0 ... MAX_INDEX Note MAX_INDEX is calculated from the parameterized number of global R parameters: MAX_INDEX = (MD18156 \$MN_MM_NUM_R_PAR-AM_NCK) - 1
<expression>:	Any expression can be used as an array index, as long as the result of the expression can be converted to the INT data type (INT, REAL, BOOL, CHAR).	

<value>:	Value of the global R parameter	
	Type:	REAL
	Range of values:	For a non-exponential notation: $\pm (0.000\ 0001 \dots 9999\ 9999)$ Note: A maximum of eight decimal places are permitted
		For an exponential notation: $\pm (1*10^{-300} \dots 1*10^{+300})$ Note: <ul style="list-style-type: none"> • Notation: <mantissa>EX<exponent> e.g. 8.2EX-3 • A maximum of ten characters are permitted including sign and decimal point.

2.1.3 Predefined user variables: Link variables

Link variables can be used in the context of the "NCU-Link" function for cyclic data exchange between NCUs which are linked on a network. They facilitate data-format-specific access to the link variables memory. The link variables memory is defined both in terms of size and data structure on a system-specific basis by the user / machine manufacturer.

Link variables are system-global user variables which can be read and written in part programs and cycles by all NCUs involved in a link if link communication has been configured. Unlike global user variables (GUD), link variables can also be used in synchronized actions.

On systems without an active NCU link, link variables can be used locally on the control as additional global user variables alongside global user variables (GUD).

Syntax

```
$A_DLB[<index>]
$A_DLW[<index>]
$A_DLD[<index>]
$A_DLR[<index>]
```

Meaning

\$A_DLB:	Link variable for BYTE data format (1 byte)	
	Data type:	UINT
	Range of values:	0 ... 255
\$A_DLW:	Link variable for WORD data format (2 bytes)	
	Data type:	INT
	Range of values:	-32768 ... 32767
\$A_DLD:	Link variable for DWORD data format (4 bytes)	
	Data type:	INT
	Range of values:	-2147483648 ... 2147483647

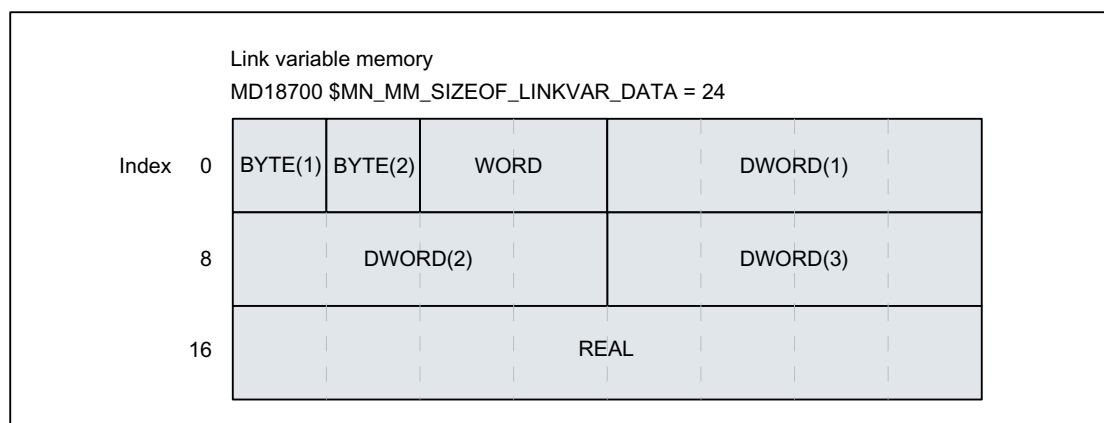

\$A_DLR:	Link variable for REAL data format (8 bytes)	
	Data type:	REAL
	Range of values:	$\pm(2,2 \cdot 10^{-308} \dots 1,8 \cdot 10^{+308})$
<index>:	Address index in bytes, counted from the start of the link variable memory	
	Data type:	INT
	Range of values:	0 - MAX_INDEX Note <ul style="list-style-type: none"> MAX_INDEX is calculated from the parameterized size of the link variables memory: $\text{MAX_INDEX} = (\text{MD18700 } \\$\text{MN_MM_SIZEOF_LINKVAR_DATA}) - 1$ Only indices may be programmed, so that the bytes addressed in the link variables memory are located on a data format limit \Rightarrow Index = n * bytes, where n = 0, 1, 2, etc. <ul style="list-style-type: none"> $\\$A_DLB[i]: i = 0, 1, 2, \dots$ $\\$A_DLW[i]: i = 0, 2, 4, \dots$ $\\$A_DLD[i]: i = 0, 4, 8, \dots$ $\\$A_DLR[i]: i = 0, 8, 16, \dots$

Example

An automation system contains two NCUs (NCU1 and NCU2). Machine axis AX2 is connected to NCU1. It is traversed as a link axis of NCU2.

NCU1 writes the actual current value (\$VA_CURR) of axis AX2 cyclically to the link variables memory. NCU2 reads the actual current value transferred via link communication cyclically and displays alarm 61000 if the limit value is exceeded.

The data structure in the link variables memory is illustrated in the following figure. The actual current value is transmitted in the REAL value.

NCU1

NCU1 uses link variable \$A_DLR[16] to write the actual current value of axis AX2 to the link variables memory cyclically in the interpolation cycle in a static synchronized action.

Program code

```
N111 IDS=1 WHENEVER TRUE DO $A_DLR[16]=$VA_CURR[AX2]
```

NCU2

NCU2 uses link variable \$A_DLR[16] to read the actual current value of axis AX2 to the link variables memory cyclically in the interpolation cycle in a static synchronized action. If the actual current value is greater than 23.0 A, alarm 61000 is displayed.

Program code

```
N222 IDS=1 WHEN $A_DLR[16] > 23.0 DO SETAL(61000)
```

See also

Variables (Page 21)

2.1.4 Definition of user variables (DEF)

With the `DEF` command, you can define user-specific variables, or user variables (user data), and assign values to them.

According to the range of validity (in other words, the range in which the variable is visible) there are the following categories of user variable:

- **Local user variables (LUD)**
Local user variables (LUD) are variables defined in an NC program that is not the main program at the time of execution. They are created when the NC program is called, and deleted with an end of program reset – or the next time that the control system powers up. Local user variables can only be accessed within the NC program in which they are defined.
- **Program-global user variables (PUD)**
Program-global user variables (PUD) are user variables defined in an NC program used as the main program. They are created when the NC program is called, and deleted with an end of program reset – or the next time that the control system powers up. It is possible to access PUD in the main program and in all subprograms of the main program.

Note

Availability of program-global user variables (PUD)

Program-global user variables (PUD) defined in the main program are only available in subprograms if the following machine data is set:

MD11120 \$MN_LUD_EXTENDED_SCOPE = 1

If MD11120 = 0 the program-global user variables defined in the main program will only be available in the main program.

- **Global user variables (GUD)**
Global user variables (GUD) are NC or channel-global variables which are defined in a data block (SGUD, MGUD, UGUD, GUD4 to GUD9) and are kept even after an end of program reset or the next time that the control system powers up. GUD can be accessed in all NC programs.

User variables must be defined before they can be used (read/write). The following rules must be observed in this context:

- GUDs must be defined in a definition file, e.g. _N_DEF_DIR/_N_UGUD_DEF.
- PUDs and LUDs must be defined in the definition section of the NC program.
- The data must be defined in a dedicated block.
- Only one data type may be used for each data definition.
- Several variables of the same data type can be defined for each data definition.

Syntax

LUD and PUD

```
DEF <type> <phys_unit> <limit values> <name>[<value_1>, <value_2>,
<value_3>]=<init_value>
```

GUD

```
DEF <range> <pp_stop> <access_rights> <data class> <type>
<phys_unit> <limit values> <name>[<value_1>, <value_2>,
<value_3>]=<init_value>
```

Meaning

DEF:	Command for defining GUD, PUD, LUD user variables	
<range>:	Range of validity, only relevant for GUD:	
	NC:	NC-global user variable
	CHAN:	Channel-global user variable
<PP_stop>:	Preprocessing stop, only relevant for GUD (optional)	
	SYNR:	Preprocessing stop when reading
	SYNW:	Preprocessing stop when writing
	SYNRW:	Preprocessing stop when reading/writing
<access rights>:	Protection level for reading/writing GUD via NC program or OPI (optional)	
	APRP <protection level>:	Read: NC program
	APWP <protection level>:	Write: NC program
	APRB <protection level>:	Read: OPI
	APWB <protection level>:	Write: OPI
	<protection level>:	Range of values: 0 ... 7
	See "Attribute: Access rights (APR, APW, APRP, APWP, APRB, APWB) (Page 45)"	
<data class>:	Data class assignment (only SINUMERIK 828D)	
	DCM:	Data class M (= Manufacturer)
	DCI:	Data class I (= Individual)
	DCU:	Data class U (= User)
	See "Attribute: Data class (DCM, DCI, DCU) - only SINUMERIK 828D (Page 49)".	
<type>:	Data type:	
	INT:	Integer with sign
	REAL:	Real number (LONG REAL to IEEE)
	BOOL:	Truth value TRUE (1)/FALSE (0)
	CHAR:	ASCII character
	STRING[<MaxLength>]:	Character string of a defined length
	AXIS:	Axis/spindle identifier
	FRAME:	Geometric data for a static coordinate transformation
	See "Data types (Page 58)"	
<phys_unit>:	Physical unit (optional)	
	PHU <unit>:	Physical unit
	See "Attribute: Physical unit (PHU) (Page 43)"	
<limit values>:	Lower/upper limit value (optional)	
	LLI <limit value>:	Lower limit value (lower limit)
	ULI <limit value>:	Upper limit value (upper limit)
	See "Attribute: Limit values (LLI, ULI) (Page 41)"	

2.1 Variables

<name>:	Name of variable Note <ul style="list-style-type: none"> • Maximum 31 characters • The first two characters must be a letter and/or an underscore. • The \$ sign is reserved for system variables and must not be used.
[<value_1>, <value_2>, <value_3>]:	Specification of array sizes for 1- to max. 3-dimensional array variables (optional) For the Initialization of array variables see "Definition and initialization of array variables (DEF, SET, REP) (Page 52)"
<init_value>:	Initialization value (optional) See "Attribute: Initialization value (Page 38)" For the Initialization of array variables see "Definition and initialization of array variables (DEF, SET, REP) (Page 52)"

Examples

Example 1: Definition of user variables in the data block for machine manufacturers

Program code	Comment
<pre> %_N_MGUD_DEF \$PATH=/_N_DEF_DIR DEF CHAN REAL PHU 24 LLI 0 ULI 10 STROM_1, STROM_2 ;Description ;Definition of two GUD items: STROM_1, STROM_2 ;Range of validity: Throughout the channel ;Data type: REAL PP stop: Not programmed => default value = no PP stop ; phys. unit: 24 = [A] ;Limit values: Low = 0.0, high = 10.0 ;Access rights: Not programmed => default value = 7 = key-operated switch position 0 ;Initialization value: Not programmed => default value = 0.0 DEF NCK REAL PHU 13 LLI 10 APWP 3 APRP 3 APWB 0 APRB 2 ZEIT_1=12, ZEIT_2=45 ;Description ;Definition of two GUD items: ZEIT_1, ZEIT_2 ;Range of validity: Throughout NC ;Data type: REAL PP stop: Not programmed => default value = no PP stop ; phys. unit: 13 = [s] ;Limit values: low = 10.0, high = not programmed => upper definition range limit ;Access rights: ; NC program: Write/read = 3 = end user ;OPI: Write = 0 = Siemens, read = 3 = end user ;Initialization value: ZEIT_1 = 12.0, ZEIT_2 = 45.0 </pre>	<pre> ; GUD block: Machine manufacturer </pre>

Program code	Comment
DEF NCK APWP 3 APRP 3 APWB 0 APRB 3 STRING[5] GUD5_NAME = "COUNTER"	
;Description	
;Definition of one GUD item: GUD5_NAME	
;Range of validity: Throughout NC	
;Data type: STRING, max. 5 characters	
PP stop: Not programmed => default value = no PP stop	
; phys. unit: Not programmed => default value = 0 = no phys. unit	
;Limit values: Not programmed => definition range limits: Low = 0, high = 255	
;Access rights:	
; NC program: Write/read = 3 = end user	
;OPI: Write = 0 = Siemens, read = 3 = end user	
;Initialization value: "COUNTER"	
M30	

Example 2: Global program and local user variables (PUD/LUD)

Program code	Comment
PROC MAIN	; Main program
DEF INT VAR1	;PUD definition
...	
SUB2	;Subprogram call
...	
M30	

Program code	Comment
PROC SUB2	;Subprogram SUB2
DEF INT VAR2	;LUD DEFINITION
...	
IF (VAR1==1)	;Read PUD
VAR1=VAR1+1	;Read & write PUD
VAR2=1	;Write LUD
ENDIF	
SUB3	;Subprogram call
...	
M17	

Program code	Comment
PROC SUB3	;Subprogram SUB3
...	
IF (VAR1==1)	;Read PUD
VAR1=VAR1+1	;Read & write PUD
VAR2=1	;Error: LUD from SUB2 not known
ENDIF	

Program code	Comment
...	
M17	

Example 3: Definition and use of user variables of data type AXIS

Program code	Comment
DEF AXIS ABSCISSA	; 1st geometry axis
DEF AXIS SPINDLE	;Spindle
...	
IF ISAXIS(1) == FALSE GOTOF CONTINUE	
ABSCISSA = \$P_AXN1	
CONTINUE:	
...	
SPINDLE=(S1)	; 1st spindle
OVRA[SPINDLE]=80	;Spindle override = 80%
SPINDLE=(S3)	; 3rd spindle

Supplementary conditions**Global user variables (GUD)**

In the context of the definition of global user variables (GUD), the following machine data has to be taken into account:

No.	Identifier: \$MN_	Meaning
11140	GUD_AREA_SAVE_TAB	Additional save for GUD blocks
18118 ¹⁾	MM_NUM_GUD_MODULES	Number of GUD files in the active file system
18120 ¹⁾	MM_NUM_GUD_NAMES_NCK	Number of global GUD names
18130 ¹⁾	MM_NUM_GUD_NAMES_CHAN	Number of channel-specific GUD names
18140 ¹⁾	MM_NUM_GUD_NAMES_AXIS	Number of axis-spec. GUD names
18150 ¹⁾	MM_GUD_VALUES_MEM	Memory location for global GUD values
18660 ¹⁾	MM_NUM_SYNACT_GUD_REAL	Number of configurable GUD of the REAL data type
18661 ¹⁾	MM_NUM_SYNACT_GUD_INT	Number of configurable GUD of the INT data type
18662 ¹⁾	MM_NUM_SYNACT_GUD_BOOL	Number of configurable GUD of the BOOL data type
18663 ¹⁾	MM_NUM_SYNACT_GUD_AXIS	Number of configurable GUD of the AXIS data type
18664 ¹⁾	MM_NUM_SYNACT_GUD_CHAR	Number of configurable GUD of the CHAR data type
18665 ¹⁾	MM_NUM_SYNACT_GUD_STRING	Number of configurable GUD of the STRING data type

¹⁾ For SINUMERIK 828D, MD can only be read!

Cross-channel use of an NC-global user variable of the AXIS data type

An NC-global user variable of the `AXIS` data type initialized during definition in the data block with an axis identifier can then only be used in other NC channels if the axis has the same channel axis number in these channels.

If this is not the case, the variable has to be loaded at the beginning of the NC program or, as in the following example, the `AXNAME(...)` function (see "Axis functions (AXNAME, AX, SPI, AXTOSPI, ISAXIS, AXSTRING, MODAXVAL) (Page 631)") has to be used.

Program code	Comment
DEF NCK STRING[5] ACHSE="X"	;Definition in the data block
...	
N100 AX[AXNAME(ACHSE)]=111 G00	; Use in the NC program

2.1.5 Redefinition of system data, user data, and NC commands (REDEF)

The `REDEF` command changes the attributes of system data, user data, and NC commands. A fundamental condition of redefinition is that it has to post-date the corresponding definition.

Multiple attributes cannot be changed simultaneously during redefinition. A separate `REDEF` command must be programmed for each attribute to be changed.

If several concurrent attribute changes are programmed, the last change is always active.

Resetting attribute values

The attributes for access rights and initialization time change with `REDEF` can be reset to their default values by reprogramming `REDEF`, followed by the name of the variable or the NC language command:

- Access rights: Protection level 7
- Initialization time: No initialization or retention of the current value

Redefinable attributes

See "Overview of definable and redefinable attributes (Page 50)".

Local user variables (PUD/LUD)

Redefinitions are not permitted for local user variables (PUD/LUD).

Syntax

```
REDEF <name> <PP_stop>
REDEF <name> <phys_unit>
REDEF <name> <limit_values>
REDEF <name> <access_rights>
REDEF <name> <init_time>
REDEF <name> <init_time> <init_value>
REDEF <name> <data class>
```

REDEF <name>

Meaning

REDEF:	Command for redefinition of a certain attribute or to reset the "Access rights" and/or "Initialization time" attributes of system variables, user variables and NC language commands	
<name>:	Name of an already defined variable or an NC language command	
<PP stop>:	Preprocessing stop	
	SYNR:	Preprocessing stop when reading
	SYNW:	Preprocessing stop when writing
	SYNRW:	Preprocessing stop when reading/writing
<phys_unit>:	Physical unit	
	PHU <unit>:	Physical unit
	See "Attribute: Physical unit (PHU) (Page 43)". Note Cannot be redefined for: <ul style="list-style-type: none"> • System variables • Global user data (GUD) of the data types: BOOL, AXIS, STRING, FRAME 	
<limit values>:	Lower/upper limit	
	LLI <limit value>:	Lower limit value (lower limit)
	ULI <limit value>:	Upper limit value (upper limit)
	See "Attribute: Limit values (LLI, ULI) (Page 41)". Note Cannot be redefined for: <ul style="list-style-type: none"> • System variables • Global user data (GUD) of the data types: BOOL, AXIS, STRING, FRAME 	
<access rights>:	Access rights for reading/writing via part program or OPI	
	APX <protection level>:	Execute: NC language element
	APRP <protection level>:	Read: Part program
	APWP <protection level>:	Write: Part program
	APRB <protection level>:	Read: OPI
	APWB <protection level>:	Write: OPI
	<protection level>:	Range of values: 0 ... 7
	See "Attribute: Access rights (APR, APW, APRP, APWP, APRB, APWB) (Page 45)".	

<init_time>:	Point in time at which the variable is reinitialized	
	INIPO:	Power On
	INIRE:	End of main program, NC reset or Power On
	INICF:	NEWCONF or main program end, NC reset or Power On
	PRLOC:	End of main program, NC reset following local change or Power On
	See "Attribute: Initialization value (Page 38)".	
<init_value>:	Initialization value	
	When redefining the initialization value, an initialization time always has to be specified also (see <init_time>).	
	See "Attribute: Initialization value (Page 38)".	
	For the Initialization of array variables, see "Definition and initialization of array variables (DEF, SET, REP) (Page 52)".	
<data class>:	Note	
	Cannot be redefined for system variables, except setting data.	
	Data class assignment (only SINUMERIK 828D)	
	DCM:	Data class M (= Manufacturer)
	DCI:	Data class I (= Individual)
	DCU:	Data class U (= User)
	See "Attribute: Data class (DCM, DCI, DCU) - only SINUMERIK 828D (Page 49)".	

Example

Redefinitions of system variable \$TC_DPCx in the data block for machine manufacturers

Program code
<pre> %_N_MGUD_DEF ; GUD block: Machine manufacturer N100 REDEF \$TC_DPC1 APWB 2 APWP 3 N200 REDEF \$TC_DPC2 PHU 21 N300 REDEF \$TC_DPC3 LLI 0 ULI 200 N400 REDEF \$TC_DPC4 INIPO (100, 101, 102, 103) N800 REDEF \$TC_DPC1 N900 REDEF \$TC_DPC4 M30 </pre>

regard- Write access: OPI = protection level 2, part program = protection level 3
ing

N100:

regard- Physical unit [%]
ing

N200:

regard- Lower limit value = 0, upper limit value = 200
ing

N300:

2.1 Variables

regard- The array variable is initialized with the four values at POWER ON.
ing
N400:
regard- Reset of the "Access rights" and/or "Initialization time" attribute values
ing
N800 /
N900

Note

Use of ACCESS files

If ACCESS files are used, the redefinition of access rights has to be relocated from
_N_MGUD_DEF to _N_MACCESS_DEF.

Supplementary conditions

Granularity

A redefinition is always applied to the entire variable which is uniquely identified by its name.
Array variables do not, for example, support the assignment of different attributes to individual
array elements.

2.1.6 Attribute: Initialization value

Definition (DEF) of user variables

During definition, an initialization value can be preassigned for the following user variables:

- Global user variables (GUD)
- Program-global user variables (PUD)
- Local user variables (LUD)

Redefinition (REDEF) of system and user variables

During redefinition, an initialization value can be preassigned for the following variables:

- System data
 - Setting data
- User data
 - R parameters
 - Synchronized action variables (\$AC_MARKER, \$AC_PARAM, \$AC_TIMER)
 - Synchronized action GUD (SYG_xy[], where x=R, I, B, A, C, S and y=S, M, U, 4 to 9)
 - EPS parameters
 - Tool data OEM
 - Magazine data OEM
 - Global user variables (GUD)

Reinitialization time

During redefinition, the point in time can be specified at which the variable should be reinitialized, i.e. reset to the initialization value.

- INIPO (POWER ON)
The variable is reinitialized at Power On.
- INIRE (reset)
The variable is reinitialized on NC reset, mode group reset, at the end of the part program (M02/M30) or at Power On.
- INICF (NEWCONF)
For the function "Set machine data active", the variable is reinitialized via HMI, part program command NEWCONF or NC reset, mode group reset, part program end (M02 / M30) or a Power On.
- PRLOC (program-local change)
The variable is only reinitialized on an NC reset, mode group reset or at the end of the part program (M02/M30) if it has changed during the current part program.
The PRLOC attribute may only be changed in conjunction with programmable setting data (see the table below).

Table 2-1 Programmable setting data

Number	Identifier	G command ¹⁾
42000	\$SC_THREAD_START_ANGLE	SF
42010	\$SC_THREAD_RAMP_DISP	DITS/DITE
42400	\$SA_PUNCH_DWELLTIME	PDELAYON
42800	\$SA_SPIND_ASSIGN_TAB	SETMS
43210	\$SA_SPIND_MIN_VELO_G25	G25
43220	\$SA_SPIND_MAX_VELO_G26	G26
43230	\$SA_SPIND_MAX_VELO_LIMS	LIMS
43300	\$SA_ASSIGN_FEED_PER_REV_SOURCE	FPRAON

Number	Identifier	G command ¹⁾
43420	\$SA_WORKAREA_LIMIT_PLUS	G26
43430	\$SA_WORKAREA_LIMIT_MINUS	G25
43510	\$SA_FIXED_STOP_TORQUE	FXST
43520	\$SA_FIXED_STOP_WINDOW	FXSW

43760	\$SA_OSCILL_END_POS	OSE
43770	\$SA_OSCILL_CTRL_MASK	OSCTRL
43780	\$SA_OSCILL_IS_ACTIVE	OS
43790	\$SA_OSCILL_START_POS	OSB
1) This G command addresses the setting data.		

Supplementary conditions

Initialization value: Global user variables (GUD)

- Only `INIPO` (Power On) can be defined as the initialization time for global user variables (GUD) with the `NC` range of validity.
- In addition to `INIPO` (Power On), `INIRE` (reset) or `INICF` (NEWCONF) can be defined as the initialization time for global user variables (GUD) with the `CHAN` range of validity.
- In the case of global user variables (GUD) with the `CHAN` range of validity and `INIRE` (reset) or `INICF` (NEWCONF) initialization time, for an NC reset, mode group reset and "Activate machine data", the variables are only reinitialized in the channels in which the named events were triggered.

Initialization value: FRAME data type

It is not permitted to specify an initialization value for variables of the `FRAME` data type. Variables of the `FRAME` data type are initialized implicitly and always with the default frame.

Initialization value: CHAR data type

For variables of the `CHAR` data type, instead of the ASCII code (0...255), the corresponding ASCII character can be programmed in quotation marks, e.g. "A".

Initialization value: Data type STRING

In the case of variables of the `STRING` data type, the character string must be enclosed in quotation marks, e.g. `...="MACHINE_1"`

Initialization value: AXIS data type

In the case of variables of the `AXIS` data type, for an extended address notation, the axis identifier must be enclosed in brackets, e.g. `...=(X3)`.

Initialization value: System variable

For system variables, redefinition cannot be used to define user-specific initialization values. The initialization values for the system variables are specified by the system and cannot be changed. However, redefinition can be used to change the point in time (INIRE, INICF) at which the system variable is reinitialized.

Implicit initialization value: AXIS data type

For variables of the `AXIS` data type the following implicit initialization value is used:

- System data: "First geometry axis"
- Synchronized action GUD (designation: SYG_A*), PUD, LUD:
axis designation from the machine data: MD20082
\$MC_AXCONF_CHANAX_DEFAULT_NAME

Implicit initialization value: Tool and magazine data

Initialization values for tool and magazine data can be defined using the following machine data: MD17520 \$MN_TOOL_DEFAULT_DATA_MASK

Note**Synchronization**

The synchronization of events triggering the reinitialization of a global variable when this variable is read in a different location is the sole responsibility of the user / machine manufacturer.

See also

Variables (Page 21)

2.1.7 Attribute: Limit values (LLI, ULI)

An upper and a lower limit of the definition range can only be defined for the following data types:

- INT
- REAL
- CHAR

Definition (DEF) of user variables: Limit values and implicit initialization values

If no explicit initialization value is defined when defining a user variable of one of the above data types, the variable is set to the data type's implicit initialization value.

- INT: 0
- REAL: 0.0
- CHAR: 0

If the implicit initialization value is outside the definition range specified by the programmed limit values, the variable is initialized with the limit value which is closest to the implicit initialization value:

- Implicit initialization value < lower limit value (LLI) ⇒ initialization value = lower limit value
- Implicit initialization value > upper limit value (ULI) ⇒ initialization value = upper limit value

Examples:

Program code	Comment
DEF REAL GUD1	; Lower limit value = definition range limit ; Upper limit value = definition range limit ; No initialization value programmed ; => Implicit initialization value = 0.0
DEF REAL LLI 5.0 GUD2	; Lower limit value = 5.0 ; Upper limit value = definition range limit ; => Initialization value = 5.0
DEF REAL ULI -5 GUD3	; Lower limit value = definition range limit ; Upper limit value = -5.0 ; => Initialization value = -5.0

Redefinition (REDEF) of user variables: Limit values and current actual values

If the limit values of a user variable are redefined, they change to the extent that the current actual value is outside the new definition range, an alarm will be issued and the limit values will be rejected.

Note

Redefinition (REDEF) of user variables

If the limit values of a user variable are redefined, care must be taken to ensure that the following values are changed consistently:

- Limit values
- Actual value
- Initialization value on redefinition and automatic reinitialization on the basis of INIPO, INIRE or INICF

See also

Variables (Page 21)

2.1.8 Attribute: Physical unit (PHU)

A physical unit can only be specified for variables of the following data types:

- INT
- REAL

Programmable physical units (PHU)

The physical unit is specified as fixed point number: PHU <unit>

The following physical units can be programmed:

<unit>	Meaning	Physical unit
0	Not a physical unit	-
1	Linear or angular position ¹⁾²⁾	[mm], [inch], [degree]
2	Linear position ²⁾	[mm], [inch]
3	Angular position	[degree]
4	Linear or angular velocity ¹⁾²⁾	[mm/min], [inch/min], [rpm]
5	Linear velocity ²⁾	[mm/min]
6	Angular velocity	[rpm]
7	Linear or angular acceleration ¹⁾²⁾	[m/s ²], [inch/s ²], [rev/s ²]
8	Linear acceleration ²⁾	[m/s ²], [inch/s ²]
9	Angular acceleration	[rev/s ²]
10	Linear or angular jerk ¹⁾²⁾	[m/s ³], [inch/s ³], [rev/s ³]
11	Linear jerk ²⁾	[m/s ³], [inch/s ³]
12	Angular jerk	[rev/s ³]
13	Time	[s]
14	Position controller gain	[16.667/s]
15	Revolutional feedrate ²⁾	[mm/rev], [inch/rev]
16	Temperature compensation ¹⁾²⁾	[mm], [inch]
18	Force	[N]
19	Mass	[kg]
20	Moment of inertia ³⁾	[kgm ²]
21	Percent	[%]
22	Frequency	[Hz]
23	Voltage	[V]
24	Current	[A]
25	Temperature	[°C]
26	Angle	[degree]
27	KV	[1000/min]
28	Linear or angular position ³⁾	[mm], [inch], [degree]
29	Cutting rate ²⁾	[m/min], [feet/min]
30	Peripheral speed ²⁾	[m/s], [feet/s]
31	Resistance	[ohm]
32	Inductance	[mH]

<unit>	Meaning	Physical unit
33	Torque ³⁾	[Nm]
34	Torque constant ³⁾	[Nm/A]
35	Current controller gain	[V/A]
36	Speed controller gain ³⁾	[Nm/(rad*s)]
37	Speed	[rpm]
42	Power	[kW]
43	Current, low	[μ A]
46	Torque, low ³⁾	[μ Nm]
48	Per mil	-
49	-	[Hz/s]
65	Flow rate	[l/min]
66	Pressure	[bar]
67	Volume ³⁾	[cm ³]
68	Controlled-system gain ³⁾	[mm/(V*min)]
69	Force controller controlled-system gain	[N/V]
155	Thread lead ³⁾	[mm/rev], [inch/rev]
156	Change in thread lead ³⁾	[mm/rev / rev], [inch/rev / rev]

1) The physical unit depends on the axis type: Linear or rotary axis

2) System of units changeover

G70/G71(inch/metric)

After changing over the basic system (MD10240 \$MN_SCALING_SYSTEM_IS_METRIC) with G70/G71, for read/write operations to system and user variables involving a length, then the values are **not** converted (actual value, default value and limit values)

G700/G710(inch/metric)

After changing over the basic system (MD10240 \$MN_SCALING_SYSTEM_IS_METRIC) with G700/G710, for read/write operations to system and user variables involving a length, then the values **are** converted (actual value, default value and limit values)

3) The variable is **not** converted to the NC's current measuring system (inch/metric) automatically. Conversion is the sole responsibility of the user/machine manufacturer.

Note

Level overflow due to format conversion

The internal storage format for all user variables (GUD/PUD/LUD) with physical units of length is metric. Excessive use of these types of variable in the NCK's main run, e.g. in synchronized actions, can lead to a CPU time overflow at interpolation level when the measuring system is switched over, generating alarm 4240.

Note

Compatibility of units

When using variables (assignment, comparison, calculation, etc.) the compatibility of the units involved is not checked. Should conversion be required, this is the sole responsibility of the user / machine manufacturer.

See also

Variables (Page 21)

2.1.9 Attribute: Access rights (APR, APW, APRP, APWP, APRB, APWB)**Designation**

The designation of the access attribute `AP...` comprises:

1. A: **A**ccess
2. P: **P**rotection
3. R / W: **R**ead / **W**rite
4. P / O: **P**rogram / **B**TSS (OPI)

Access rights / access levels

The following access levels, which have to be specified during programming, correspond to the access rights:

Access right	Protection level
System password	0
Machine manufacturer password	1
Service password	2
End user password	3
Key-operated switch position 3	4
Key-operated switch position 2	5
Key-operated switch position 1	6
Key-operated switch position 0	7

Definition (DEF) of user data

Access rights (`APR...`/`APW...`) can be defined for the following data:

- Global user data (GUD)

Redefinition (REDEF) of system and user data

Access rights (APR.../APW...) can be redefined for the following data:

- System data

- Machine data

Note**Redefinition of reading rights of machine data**

The protection level for reading machine data can only be set with the keyword APR in common for part program and OPI.

The keywords APRP and APRB are not supported by the redefinition of the reading rights, and lead to the message of interrupt 12490 "Access right APRP/APRB <protection level> was not set".

- Setting data

- System variable

- Process data

- Magazine data

- Tool data

- User data

- R parameters

- Synchronized action variables (\$AC_MARKER, \$AC_PARAM, \$AC_TIMER)

- Synchronized action GUD (SYG_xy[], where x=R, I, B, A, C, S and y=S, M, U, 4 to 9)

- EPS parameters

- Tool data OEM

- Magazine data OEM

- Global user variables (GUD)
-

Note

During redefinition the access right can be freely assigned to a variable between the lowest protection level 7 and the dedicated protection level, e.g. 1 (machine manufacturer).

Redefinition (REDEF) of NC language commands

The access or execution right (APX) can be redefined for the following NC language commands:

- G commands / preparatory functions

References
Programming Manual, Fundamentals, Section: Predefined subprogram calls
- DO operation with synchronized actions
- Cycles program identifier
The cycle must be saved in a cycle directory and must contain a PROC operation.

Access rights in relation to NC programs and cycles (APRP, APWP)

The various access rights facilitate the following with regard to access from an NC program or cycle:

- APRP 0/APWP 0
 - During NC program processing the system password has to be set.
 - The cycle has to be stored in the _N_CST_DIR directory (system).
 - The execution right must be set to system for the _N_CST_DIR directory in MD11160 \$MN_ACCESS_EXEC_CST.
- APRP 1/APWP 1 or APRP 2/APWP 2
 - During NC program processing the machine manufacturer or service password has to be set.
 - The cycle has to be stored in the _N_CMA_DIR (machine manufacturer) or _N_CST_DIR directory.
 - The execution rights must be set to at least machine manufacturer for the _N_CMA_DIR or _N_CST_DIR directories in machine data MD11161 \$MN_ACCESS_EXEC_CMA or MD11160 \$MN_ACCESS_EXEC_CST respectively.
- APRP 3/APWP 3
 - During NC program execution, the end-user password must be set.
 - The cycle has to be stored in the _N_CUS_DIR (user), _N_CMA_DIR or _N_CST_DIR directory.
 - The execution rights must be set to at least end user for the _N_CUS_DIR, _N_CMA_DIR or _N_CST_DIR directories in machine data MD11162 \$MN_ACCESS_EXEC_CUS, MD11161 \$MN_ACCESS_EXEC_CMA or MD11160 \$MN_ACCESS_EXEC_CST respectively.
- APRP 4...7/APWP 4...7
 - During NC program processing the key-operated switch must be set to 3 ... 0.
 - The cycle has to be stored in directory _N_CUS_DIR, _N_CMA_DIR or in directory _N_CST_DIR.
 - The execution rights must be set to at least the corresponding key-operated switch position for the _N_CUS_DIR, _N_CMA_DIR or _N_CST_DIR directories in machine data MD11162 \$MN_ACCESS_EXEC_CUS, MD11161 \$MN_ACCESS_EXEC_CMA or MD11160 \$MN_ACCESS_EXEC_CST respectively.

Access rights in relation to OPI (APRB, APWB)

The access rights (APRB, APWB) restrict access to system and user variables via the OPI equally for all system components (HMI, PLC, external computers, EPS services, etc.).

Note

Local HMI access rights

When changing access rights to system data, care must be taken to ensure that such changes are consistent with the access rights defined using HMI mechanisms.

APR/APW access attributes

For compatibility reasons, attributes APR and APW are implicitly mapped to the attributes APRP / APRB and APWP / APWB:

- $APR\ x \Rightarrow APRP\ x\ APRB\ x$
- $APW\ y \Rightarrow APWP\ y\ APWB\ y$

Access rights using ACCESS files

When using ACCESS files to assign access rights, access rights for system data, user data, and NC language commands must only be redefined in ACCESS files. Global user data (GUD) is an exception. For this data, access rights still have to be redefined in the corresponding definition files *_DEF.

For continuous access protection, the machine data for the execution rights and the access protection for the corresponding directories have to be modified consistently.

In principle, the procedure is as follows:

1. Creation of the necessary definition files:
 - _N_DEF_DIR/_N_SACCESS_DEF
 - _N_DEF_DIR/_N_MACCESS_DEF
 - _N_DEF_DIR/_N_UACCESS_DEF
2. Setting of the write right for the definition files to the value required for redefinition:
 - MD11170 \$MN_ACCESS_WRITE_SACCESS = <protection level>
 - MD11171 \$MN_ACCESS_WRITE_MACCESS = <protection level>
 - MD11172 \$MN_ACCESS_WRITE_UACCESS = <protection level>

3. For access to protected elements from cycles, the execution and write rights for cycle directories `_N_CST_DIR`, `_N_CMA_DIR`, and `_N_CST_DIR` have to be modified.

Execution rights

- MD11160 \$MN_ACCESS_EXEC_CST = <protection level>
- MD11161 \$MN_ACCESS_EXEC_CMA = <protection level>
- MD11162 \$MN_ACCESS_EXEC_CUS = <protection level>

Write rights

- MD11165 \$MN_ACCESS_WRITE_CST = <protection level>
- MD11166 \$MN_ACCESS_WRITE_CMA = <protection level>
- MD11167 MN_ACCESS_WRITE_CUS = <protection level>

The execution right has to be set to at least the same protection level as the highest protection level of the element used.

The write right must be set to at least the same protection level as the execution right.

4. The write rights of the local HMI cycle directories must be set to the same protection level as the local NC cycle directories.

References

Operating Manual

Subprogram calls in ACCESS files

To structure access protection further, subprograms (SPF or MPF identifier) can be called in ACCESS files. The subprograms inherit the execution rights of the calling ACCESS file.

Note

Only access rights can be redefined in the ACCESS files. All other attributes have to continue to be programmed/redefined in the corresponding definition files.

Variables (Page 21)

2.1.10 Attribute: Data class (DCM, DCI, DCU) - only SINUMERIK 828D

To simplify the data handling during the commissioning, series start-up and upgrade of machines and machine series, all system and user data of the NC is divided into data classes.

Data class	Data
S = System	System data provided by Siemens, such as machine and setting data, standard and measuring cycles, definitions (SGUD) and macros (SMAC), etc.
M = Manufacturer (machine manufacturer)	Machine series-specific commissioning data such as manufacturer cycles, definitions (MGUD) and macros (MMAC) and machine data that defines the functional scope of the machine.

Data class	Data
I = Individual (machine-specific)	Machine-specific commissioning data such as compensation data reference point offsets.
U = User	Machine-specific data generated during operation of the machine such as tool data, setting data, part programs, user cycles, definitions (UGUD) and macros (UMAC).

References:

SINUMERIK 828D Commissioning Manual, Turning and Milling; Section "Introduction and use of data classes"

Definition (DEF) of user data

The data class of the data item is implicitly specified through the data class of the file or directory in which the user data is defined. The data class of the data item cannot be changed.

However, for the definition (DEF) of the user data, a different data class to that of the data item can be specified for the **data value**.

The following must apply for the data class of the data item:

Priority of the data class of the data value \leq priority of the data class of the data item

Example:

The definition of the GUD, which defines a probe, should be in data class M (= Manufacturer) because it is required to run the manufacturer cycles. However, the value of the data item should belong to data class I (= Individual) because the probe type can differ from machine to machine.

MGUD.DEF (data class M)

```
...
DEF CHAN DCI INT CALIPER
...
```

Redefinition (REDEF) of system data

The data class of the system data can be changed through redefinition (REDEF). The redefinition must be performed in a definition file with data class S or M.

When using ACCESS files, the redefinitions may only be performed with the ACCESS files.

The respective data class of the machine, setting and option data as well as the system variables can be found in the

- List Manual, Detailed Machine Data Description, parameter: "Class"
- List Manual, System Variables

2.1.11 Overview of definable and redefinable attributes

The following tables show which attributes can be defined (DEF) and/or redefined (REDEF) for which data types.

System data

Data type	Init. value	Limit values	Physical unit	Access rights	Data class (only 828D)
Machine data	---	---	---	REDEF	REDEF
Setting data	REDEF	---	---	REDEF	---
FRAME data	---	---	---	REDEF	---
Process data	---	---	---	REDEF	---
Leadscrew error comp. (EEC)	---	---	---	REDEF	---
Sag compensation (CEC)	---	---	---	REDEF	---
Quadrant error compensation (QEC)	---	---	---	REDEF	---
Magazine data	---	---	---	REDEF	---
Tool data	---	---	---	REDEF	---
Protection areas	---	---	---	REDEF	---
Toolholder, with orientation capability	---	---	---	REDEF	---
Kinematic chains	---	---	---	REDEF	---
3D protection areas	---	---	---	REDEF	---
Working area limitation	---	---	---	REDEF	---

User data

Data type	Init. value	Limit values	Physical unit	Access rights	Data class

Variables (Page 21)

2.1.12 Definition and initialization of array variables (DEF, SET, REP)

A user variable can be defined as a 1- up to a maximum of a 3-dimensional array.

- 1-dimensional: DEF <data type> <variable name>[<n>]
- 2-dimensional: DEF <data type> <variable name>[<n>,<m>]
- 3-dimensional: DEF <data type> <variable name>[<n>,<m>,<o>]

Note

STRING data type user variables can be defined as up to a maximum of 2-dimensional arrays.

Data types

User variables can be defined as arrays for the following data types: BOOL, CHAR, INT, REAL, STRING, AXIS, FRAME

Assignment of values to array elements

Values can be assigned to array elements at the following points in time:

- During array definition (initialization values)
- During program execution

Values can be assigned by means of:

- Explicit specification of an array element
- Explicit specification of an array element as a starting element and specification of a value list (SET)
- Explicit specification of an array element as a starting element and specification of a value and the frequency at which it is repeated (REP)

Note

FRAME data type user variables cannot be assigned initialization values.

Syntax (DEF)

```
DEF <data type> <variable name>[<n>,<m>,<o>]
DEF  STRING[<string length>] <variable name>[<n>,<m>]
```

Syntax (DEF...=SET...)

Using a value list:

- During definition:

```
DEF <data type> <variable name>[<n>,<m>,<o>]=SET(<value1>,<value2>, etc.)
```

Equivalent to:

```
DEF <data type> <variable name>[<n>,<m>,<o>]=(<value1>,<value2>, etc.)
```

Note

SET does not have to be specified for initialization via a value list.

- During value assignment:

```
<variable name>[<n>,<m>,<o>]=SET(<VALUE1>,<value2>, etc.)
```

Syntax (DEF...=REP...)

Using a value with repetition

- During definition:

```
DEF <data type> <variable name>[<n>,<m>,<o>]=REP(<value>)
DEF <data type> <variable name>[<n>,<m>,<o>]=REP(<value>,<number_array_elements>)
```

- During value assignment:

```
<variable name>[<n>,<m>,<o>]=REP(<value>)
DEF <data type> <variable name>[<n>,<m>,<o>]=REP(<value>,<number_array_elements>)
```

Meaning

DEF:	Command to define variables	
<data type>:	Data type of variables	
	Range of values:	
	<ul style="list-style-type: none"> • for system variables: BOOL, CHAR, INT, REAL, STRING, AXIS • for GUD or LUD variables: BOOL, CHAR, INT, REAL, STRING, AXIS, FRAME 	
<string length>:	Maximum number of characters for a STRING data type	
<variable name>:	Variable name.	
[<n>,<m>,<o>]:	Array sizes or array indices	
<n>:	Array size or array index for 1st dimension	
	Type:	INT (for system variables, also AXIS)
	Range of values:	Max. array size: 65535 Array index: $0 \leq n \leq 65534$

<m>:	Array size or array index for 2nd dimension		
	Type:	INT (for system variables, also AXIS)	
	Range of values:	Max. array size: 65535 Array index: $0 \leq m \leq 65534$	
<o>:	Array size or array index for 3rd dimension		
	Type:	INT (for system variables, also AXIS)	
	Range of values:	Max. array size: 65535 Array index: $0 \leq o \leq 65534$	
SET:	Value assignment using specified value list		
(<value1>,<value2>, etc.):	Value list		
REP:	Value assignment using specified <value>		
<value>:	Value, which the array elements should be written when initializing with REP.		
<number_array_elements>:	<p>Number of array elements to be written with the specified <value>. The following apply to the remaining array elements, dependent on the point in time:</p> <ul style="list-style-type: none">• Initialization when defining the array: → Zero is written to the remaining array elements.• Assignment during program execution: → The actual values of the array elements remain unchanged. <p>If the parameter is not programmed, all array elements are written with <value>.</p> <p>If the parameter equals zero, the following apply dependent on the point in time:</p> <ul style="list-style-type: none">• Initialization when defining the array: → All elements are pre-assigned zero• Assignment during program execution: → The actual values of the array elements remain unchanged.		

Array index

The implicit sequence of the array elements, e.g. in the case of value assignment using SET or REP, is right to left due to iteration of the array index.

Example: Initialization of a 3-dimensional array with 24 array elements:

```

DEF INT FELD[2,3,4] = REP(1,24)
  FELD[0,0,0] = 1      1. array element
  FELD[0,0,1] = 1      2. array element
  FELD[0,0,2] = 1      3. array element
  FELD[0,0,3] = 1      4. array element
  ...
  FELD[0,1,0] = 1      5. array element
  FELD[0,1,1] = 1      6. array element
  ...

```

```

FELD[0,2,3] = 1      12. array element
FELD[1,0,0] = 1      13. array element
FELD[1,0,1] = 1      14. array element
...
FELD[1,2,3] = 1      24. array element

```

corresponding to:

```

FOR n=0 TO 1
  FOR m=0 TO 2
    FOR o=0 TO 3
      FELD[n,m,o] = 1
    ENDFOR
  ENDFOR
ENDFOR

```

Example: Initializing complete variable arrays

For the actual assignment, refer to the diagram.

Program code

```

N10 DEF REAL FELD1[10,3]=SET(0,0,0,10,11,12,20,20,20,20,30,30,30,40,40,40,)
N20 ARRAY1[0,0] = REP(100)
N30 ARRAY1[5,0] = REP(-100)
N40 FELD1[0,0]=SET(0,1,2,-10,-11,-12,-20,-20,-20,-30, , , , -40,-40,-50,-60,-70)
N50 FELD1[8,1]=SET(8.1,8.2,9.0,9.1,9.2)

```

Variables (Page 21)

2.1.13 Definition and initialization of array variables (DEF, SET, REP): Further Information

Further information (SET)

initialization during definition

- Starting with the 1st array element, as many array elements are assigned with the values from the value list as there are elements programmed in the value list.
- A value of 0 is assigned to array elements without explicitly declared values in the value list (gaps in the value list).
- For variables of the AXIS data type, gaps in the value list are not permitted.
- If the value list contains more values than there are array elements defined, an alarm will be displayed.

Value assignment in program execution

In the case of value assignment in program execution, the rules described above for definition apply. The following options are also supported:

- Expressions are also permitted as elements in the value list.
- Value assignment starts with the programmed array index. Values can be assigned selectively to subarrays.

Example:

Program code	Comments
DEF INT ARRAY[5,5]	; Array definition
ARRAY[0,0]=SET(1,2,3,4,5)	; Value assignment to the first 5 array elements [0,0] - [0,4]
FELD[0,0]=SET(1,2, , ,5)	; Value assignment with gap to the first 5 array elements [0,0] - [0,4], array elements[0,2] and [0,3] = 0
ARRAY[2,3]=SET(VARIABLE,4*5.6)	; Value assignment with variable and expression starting at array index [2,3]: [2,3] = VARIABLE [2,4] = 4 * 5.6 = 22.4

Further information (REP)

initialization during definition

- All or the optionally specified number of array elements are initialized with the specified value (constant).
- Variables of the FRAME data type cannot be initialized.

Example:

Program code	Comments
DEF REAL varName[10]=REP(3.5,4)	; Initialize array definition and array elements [0] to [3] with value 3.5.

Value assignment in program execution

In the case of value assignment in program execution, the rules described above for definition apply. The following options are also supported:

- Expressions are also permitted as elements in the value list.
- Value assignment starts with the programmed array index. Values can be assigned selectively to subarrays.

Examples:

Program code	Comments
DEF REAL varName[10]	; Array definition
varName[5]=REP(4.5,3)	; Array elements [5] to [7] = 4.5
R10=REP(2.4,3)	; R-parameters R10 to R12 = 2.4
DEF FRAME FRM[10]	; Array definition

Program code	Comments
FRM[5] = REP(CTTRANS (X,5))	; Array elements [5] to [9] = CTRANS(X,5)

See also

Definition and initialization of array variables (DEF, SET, REP) (Page 52)

2.1.14 Data types

The following data types are available in the NC:

Data type	Meaning	Value Range
INT	Integer with sign	-2147483648 ... +2147483647
REAL	Real number (LONG REAL to IEEE)	$\pm(\sim 2,2 \cdot 10^{-308} \dots \sim 1,8 \cdot 10^{+308})$
BOOL	Truth value TRUE (1) and FALSE (0)	1, 0
CHAR	ASCII character	ASCII code 0 to 255
STRING	Character string of a defined length	Maximum of 200 characters (no special characters)
AXIS	Axis/spindle identifier	Channel axis identifier
FRAME	Geometric parameters for static coordinate transformation (translation, rotation, scaling, mirroring)	---

Implicit data type conversions

The following data type conversions are possible and are performed implicitly during assignments and parameter transfers:

from ↓/ to →	REAL	INT	BOOL
REAL	x	o	&
INT	x	x	&
BOOL	x	x	x

x : Possible without restrictions
 o: Data loss possible due to the range of values being overshoot ⇒ alarm;
 rounding: decimal place value $\geq 0.5 \Rightarrow$ round up, decimal place value $< 0.5 \Rightarrow$ round down
 &: value $\neq 0 \Rightarrow$ TRUE, value $= 0 \Rightarrow$ FALSE

See also

Variables (Page 21)

2.1.15 Check availability of a variable (ISVAR)

The predefined ISVAR function can be used to check whether a system/user variable (e.g. machine data, setting data, system variable, general variables such as GUD) is known in the NC.

Variable

The variables to be queried have the following structure:

Dimensionless variable: <Variable>
 One-dimensional variable without array index: <Variable>[]
 One-dimensional variable with array index n: <Variable>[<n>]
 Two-dimensional variable without array index: <Variable>[,]
 Two-dimensional variable with array indices n <Variable>[<n>,<m>]
 and m:

Syntax

```
<Result>=ISVAR(<Variable>[<n>,<m>])
```

Meaning

<result>:	Return value		
	Data type:	BOOL	
	Range of values:	1	Variable available
		0	Variable unknown
ISVAR:	Checks whether the specified system/user variable is known in the NC.		
<Variable>:	Name of the system/user variable		
	Data type:	STRING	
<n>:	Array index of the first dimension (optional)		
	Data type:	INT	
<m>:	Array index of the second dimension (optional)		
	Data type:	INT	

The following checks are made in accordance with the transfer parameter:

- Is the name known?
- Is the variable an array?
- Is it a one- or two-dimensional array?
- Is the respective array index in the permissible range?

Only if all checks are positive, TRUE (1) is returned.

If a check is negative or a syntax error has occurred, FALSE (0) is returned.

Examples

Program code	Comment
DEF INT VAR1	
DEF BOOL IS_VAR=FALSE	
N10 IS_VAR=ISVAR("VAR1")	; IS_VAR is in this case TRUE.

Program code	Comment
DEF REAL VARARRAY[10,10]	
DEF BOOL IS_VAR=FALSE	
N10 IS_VAR=ISVAR("VARARRAY[,]")	; IS_VAR is in this case TRUE, is a two-dimensional array.
N20 IS_VAR=ISVAR("VARARRAY")	; IS_VAR is TRUE, variable exists.
N30 IS_VAR=ISVAR("VARARRAY[8,11]")	; IS_VAR is FALSE, array index is not permitted.
N40 IS_VAR=ISVAR("VARARRAY[8,8]")	; IS_VAR is FALSE, "]" missing (syntax error).
N50 IS_VAR=ISVAR("VARARRAY[,8]")	; IS_VAR is TRUE, array index is permitted.
N60 IS_VAR=ISVAR("VARARRAY[8,]")	; IS_VAR is TRUE, array index is permitted.

Program code	Comment
DEF BOOL IS_VAR=FALSE	
N100 IS_VAR=ISVAR("\$MC_GCODE_RESET_VALUES[1]")	; Transfer parameter is a machine data item, IS_VAR is TRUE.

Program code	Comment
DEF BOOL IS_VAR=FALSE	
N10 IS_VAR=ISVAR("\$P_EP")	; IS_VAR is in this case TRUE.
N20 IS_VAR=ISVAR("\$P_EP[X]")	; IS_VAR is in this case TRUE.

2.1.16 Reading attribute values / data type (GETVARPHU, GETVARAP, GETVARLIM, GETVARDIM, GETVARDFT, GETVARTYP)

The attribute values of system/user variables can be read with the predefined GETVARPHU, GETVARAP, GETVARLIM and GETVARDFT functions, the data type of a system/user variable with GETVARTYP.

Read physical unit

Syntax:

```
<Result>=GETVARPHU(<name>)
```

Meaning:

<result>:	Numeric value of the physical unit		
	Data type:	INT	
	Range of values:	See Table in "Attribute: Physical unit (PHU) (Page 43)"	
		In case of fault	
		- 2	The specified <name> has not been assigned to a system parameter or a user variable.
GETVARPHU:	Reading of the physical unit of a system/user variable		
<name>:	Name of the system/user variables		
	Data type:	STRING	

Example:

The NC contains the following GUD variables:

```
DEF CHAN REAL PHU 42 LLI 0 ULI 10000 electric
```

Program code	Comment
DEF INT result=0	
result=GETVARPHU("elec- tric")	; Determine the physical unit of the GUD variables.
IF (result < 0) GOTOF error	

The value 42 is returned as result. This corresponds to the physical unit [kW].

Note

GETVARPHU can be used, for example, to check whether both variables have the expected physical units in a variable assignment a = b.

Read access right**Syntax:**

```
<Result>=GETVARAP (<name>, <access>)
```

Meaning:

<result>:	Protection level for the specified <access>		
	Data type:	INT	
	Range of values:	0 ... 7	See "Attribute: Access rights (APR, APW, APRP, APWP, APRB, APWB) (Page 45)".
		In case of fault	
		- 1	Cannot be written (only relevant for <Access> "WP" and "WB")
		- 2	The specified <name> has not been assigned to a system parameter or a user variable.
		- 3	Incorrect value for <access>

GETVARAP:	Reading of the access right to a system/user variable			
<name>:	Name of the system/user variables			
	Data type:	STRING		
<access>:	Type of access			
	Data type:	STRING		
	Range of values:	"RP"	Read via part program	
		"WP"	Write via part program	
		"RB"	Read via OPI	
		"WB"	Write via OPI	

Example:

Program code	Comment
DEF INT result=0	
result=GETVAR-	
AP("\$TC_MAP8","WB")	; Determine the access protection for the system parameter "magazine position" with regard to writing via OPI.
IF (result < 0) GOTO error	

The value 7 is returned as result. This corresponds to the key switch position 0 (= no access protection).

Note

GETVARAP can be used, for example, to implement a checking program that checks the access rights expected by the application.

Read limit values**Syntax:**

<Status>=GETVARLIM(<name>,<limit value>,<result>)

Meaning:

<Status>:	Function status		
	Data type:	INT	
	Range of values:	1	OK
		-1	No limit value defined (for variables of type AXIS, STRING, FRAME)
		-2	The specified <name> has not been assigned to a system parameter or a user variable.
		-3	Incorrect value for <limit value>
GETVARLIM:	Reading of the lower/upper limit value of a system/user variable		
<name>:	Name of the system/user variables		
	Data type:	STRING	

<limit value>:	specifies which limit value should be read out	
	Data type:	CHAR
	Range of values:	"L" = lower limit value
		"U" = upper limit value
<result>:	Return of the limit value	
	Data type:	VAR REAL

Example:

Program code	Comment
DEF INT state=0	
DEF REAL result=0	
state=GETVARLIM("\$MA_MAX_AX_VELO", "L", result)	Determine the lower limit value for MD32000 \$MA_MAX_AX_VELO.
IF (result < 0) GOTO error	

Read attributes / data type**Syntax:**

<Result>=GETVARDIM(<Name>, Index)

Meaning:

<Result>:	Dimension / number of array <Index>	
	Data type:	INT
GETVARDIM:	Reading of the lower/upper limit value of a system/user variable	
<Name>:	Reading the number of elements of the array	
	Data type:	STRING
<Index>:	Number of the array, max. 3.	
	Data type:	INT

Example:

Program code	Comment
N5 DEF REAL myReal[5,4]	
N10 R1 = GETVATDIM("myReal",1)	R1 = 5
N15 R2 = GETVATDIM("myReal",2)	R2 = 4

Read default value**Syntax:**

<Status>=GETVARDFT(<name>,<result>[,<index_1>,<index_2>,<index_3>])

Meaning:

<Status>:	Function status		
	Data type:	INT	
	Range of values:	1	OK
		-1	No default value available (e.g. because <result> has the wrong type for <name>)
		-2	The specified <name> has not been assigned to a system parameter or a user variable.
		-3	Incorrect value for <index_1>, dimension less than one (= no array = scalar)
		-4	Incorrect value for <index_2>
		-5	Incorrect value for <index_3>
GETVARDFT:	Reading of the default value of a system/user variable		
<name>:	Name of the system/user variables		
	Data type:	STRING	
<result>:	Return of the default value		
	Data type:	VAR REAL (when reading the default value of variables of the types INT, REAL, BOOL, AXIS)	
		VAR STRING (when reading the default value of variables of the types STRING and CHAR)	
		VAR FRAME (when reading the default value of variables of the type FRAME)	
<index_1>:	Index to the first dimension (optional)		
	Data type:	INT	
	Not programmed means = 0		
<index_2>:	Index to the second dimension (optional)		
	Data type:	INT	
	Not programmed means = 0		
<index_3>:	Index to the third dimension (optional)		
	Data type:	INT	
	Not programmed means = 0		

Example:

Program code	Comment
DEF INT state=0	
DEF REAL resultR=0	; Variable to accept the default values of the types INT, REAL, BOOL, AXIS.
DEF FRAME resultF=0	; Variable to accept the default values of the type FRAME
IF (GETVARTYP("\$MA_MAX_AX_VELO") <> 4)	
GOTO error	
state=GETVARDFT("\$MA_MAX_AX_VELO", resultR, AXTOINT(X))	; Determine the default value of the "X" axis.

Program code	Comment
IF (result < 0) GOTOF error	
IF (GETVARTYP("\$TC_TP8") <> 3) GOTOF error	
state=GETVARDEF("\$TC_TP8", resultR)	
IF (GETVARTYP("\$P_UBFR") <> 7) GOTOF error	
state=GETVARDEF("\$P_UBFR", resultF)	

Read data type

Syntax:

<Result>=GETVARTYP (<name>)

Meaning:

<result>:	Data type of the specified system/user variables		
	Data type:	INT	
	Range of values:	1	= BOOL
		2	= CHAR
		3	= INT
		4	= REAL
		5	= STRING
		6	= AXIS
		7	= FRAME
		In case of fault	
< 0	The specified <name> has not been assigned to a system parameter or a user variable.		
GETVARTYP:	Reading of the data type of a system/user variable		
<name>:	Name of the system/user variables		
	Data type:	STRING	

Example:

Program code	Comment
DEF INT result=0	
DEF STRING name="R"	
result=GETVARTYP(name)	; Determine the type of the R parameter.
IF (result < 0) GOTOF error	

The value 4 is returned as result. This corresponds to the REAL data type.

2.2 Indirect programming

2.2.1 Indirectly programming addresses

When indirectly programming addresses, the extended address (<index>) is replaced by a variable with a suitable type.

Note

It is not possible to indirectly program addresses for:

- N (block number)
- L (subprogram)
- Settable addresses
(e.g. X[1] instead of X1 is not permissible)

Syntax

<ADDRESS> [<Index>]

Meaning

<ADDRESS> [...]:	Fixed address with extension (index)
<index>:	Variable, e.g. for spindle number, axis,

Examples

Example 1: Indirectly programming a spindle number

Direct programming:

Program code	Comment
S1=300	; Speed in rpm for the spindle number 1.

Indirect programming:

Program code	Comment
DEF INT SPINU=1	; Defining variables, type INT and value assignment.
S[SPINU]=300	; Speed 300 rpm for the spindle, whose number is saved in the SPINU variable (in this example 1, the spindle with the number 1).

Example 2: Indirectly programming an axis

Direct programming:

Program code	Comment
FA[U]=300	; Feedrate 300 for axis "U".

Indirect programming:

Program code	Comment
DEF AXIS AXVAR2=U	; Defining a variable, type AXIS and value assignment.
FA[AXVAR2]=300	; Feedrate of 300 for the axis whose address name is saved in the variables with the name AXVAR2.

Example 3: Indirectly programming an axis

Direct programming:

Program code	Comment
\$AA_MM[X]	; Read probe measured value (MCS) of axis "X".

Indirect programming:

Program code	Comment
DEF AXIS AXVAR3=X	; Defining a variable, type AXIS and value assignment.
\$AA_MM[AXVAR3]	; Read probe measured value (MCS) whose name is saved in the variables AXVAR3.

Example 4: Indirectly programming an axis

Direct programming:

Program code
X1=100 X2=200

Indirect programming:

Program code	Comment
DEF AXIS AXVAR1 AXVAR2	; Defining two type AXIS variables.
AXVAR1=(X1) AXVAR2=(X2)	; Assigning the axis names.
AX[AXVAR1]=100 AX[AXVAR2]=200	; Traversing the axes whose address names are saved in the variables with the names AXVAR1 and AXVAR2

Example 5: Indirectly programming an axis

Direct programming:

Program code
G2 X100 I20

Indirect programming:

Program code	Comment
DEF AXIS AXVAR1=X	; Defining a variable, type AXIS and value assignment.
G2 X100 IP[AXVAR1]=20	; Indirect programming the center point data for the axis, whose address name is saved in the variable with the name AXVAR1.

Example 6: Indirectly programming array elements

Direct programming:

Program code	Comment
DEF INT ARRAY1[4,5]	; Defining array 1

Indirect programming:

Program code	Comment
DEFINE DIM1 AS 4	; For array dimensions, array sizes must be specified as fixed values.
DEFINE DIM2 AS 5	
DEF INT ARRAY[DIM1,DIM2]	
ARRAY[DIM1-1,DIM2-1]=5	

Example 7: Indirect subprogram call

Program code	Comment
CALL "L" << R10	; Call the program, whose number is located in R10 (string cascading).

2.2.2 Indirectly programming G commands

Indirect programming of G commands permits cycles to be effectively programmed.

Syntax

G[<group>]=<number>

Meaning

G[...]:	G command with extension (index)	
<group>:	Index parameter: G group	
	Type:	INT
<number>:	Variable for the G command number	
	Type:	INT or REAL

Note

Generally, only G commands that do not determine the syntax can be indirectly programmed.

Only G group 1 is possible from the G commands that determine the syntax.

The syntax-determining G commands of G groups 2, 3 and 4 are not possible.

Note

Arithmetic functions are not permitted in the indirect G command programming. If it is necessary to calculate the G command number, this must be done in a separate part program line before the indirect G command programming.

Examples**Example 1: Adjustable work offset (G group 8)**

Program code	Comment
N1010 DEF INT INT_VAR	
N1020 INT_VAR=2	
...	
N1090 G[8]=INT_VAR G1 X0 Y0	;G54
N1100 INT_VAR=INT_VAR+1	; G command calculation
N1110 G[8]=INT_VAR G1 X0 Y0	;G55

Example 2: Level selection (G group 6)

Program code	Comment
N2010 R10=\$P_GG[6]	; Read active G command of G group 6
...	
N2090 G[6]=R10	

References

For information on the G groups, see:
Programming Manual, Fundamentals; Section "G groups"

2.2.3 Indirectly programming position attributes (GP)

Position attributes, e.g. the incremental or absolute programming of the axis position, can be indirectly programmed as variables in conjunction with the key word **GP**.

Application

The indirect programming of position attributes is used in **replacement cycles**, as in this case, the following advantage exists over programming position attributes as keyword (e.g. **IC**, **AC**, ...):

As a result of the indirect programming as variable, **no CASE** statement is required, which would otherwise branch for all possible position attributes.

Syntax

```
<POSITIONING COMMAND>[<axis/spindle>]=
GP(<position>,<position attribute>)
<axis/spindle>=BP(<position>,<position attribute>)
```

Meaning

<POSITIONING COMMAND>[]:	<p>The following positioning commands can be programmed together with the key word GP:</p> <p>POS, POSA, SPOS, SPOSA</p> <p>Also possible:</p> <ul style="list-style-type: none"> All axis and spindle identifiers present in the channel: <axis/spindle> Variable axis/spindle identifier AX
<axis/spindle>:	Axis/spindle that is to be positioned
GP():	Key word for positioning
<position>:	<p>Parameter 1</p> <p>Axis/spindle position as constant or variable</p>
<position attribute>:	<p>Parameter 2</p> <p>Position attribute (e.g. position approach mode as a variable (e.g. \$P_SUB_SPOSMODE) or as key word (IC, AC, ...))</p>

The values supplied from the variables have the following significance:

Value	Meaning	Permissible for:
0	No change to the position attribute	
1	AC	POS, POSA, SPOS, SPOSA, AX, axis address
2	IC	POS, POSA, SPOS, SPOSA, AX, axis address
3	DC	POS, POSA, SPOS, SPOSA, AX, axis address
4	ACP	POS, POSA, SPOS, SPOSA, AX, axis address
5	ACN	POS, POSA, SPOS, SPOSA, AX, axis address
6	OC	-
7	PC	-
8	DAC	POS, POSA, AX, axis address
9	DIC	POS, POSA, AX, axis address
10	RAC	POS, POSA, AX, axis address
11	RIC	POS, POSA, AX, axis address
12	CAC	POS, POSA
13	CIC	POS, POSA
14	CDC	POS, POSA
15	CACP	POS, POSA
16	CACN	POS, POSA

Example

For an active synchronous spindle coupling between the leading spindle S1 and the following spindle S2, the following replacement cycle to position the spindle is called using the SPOS command in the main program.

Positioning is realized using the statement in N2230:

```
SPOS[1]=GP($P_SUB_SPOSIT,$P_SUB_SPOSMODE) SPOS[2]=GP($P_SUB_SPOSIT,
$P_SUB_SPOSMODE)
```

The position to be approached is read from the system variable \$P_SUB_SPOSIT; the position approach mode is read from the system variable \$P_SUB_SPOSMODE.

Program code	Comment
N1000 PROC LANG_SUB DISPLOF SBLOF	
...	
N2100 IF(\$P_SUB_AXFCT==2)	
N2110	; Replacement of the SPOS / SPOSA / M19 command for an active synchronous spindle coupling
N2185 DELAYFSTON	; Start of stop delay area
N2190 COUPOF(S2,S1)	; Deactivate synchronous spindle coupling
N2200	; Position leading and following spindles
N2210 IF(\$P_SUB_SPOS==TRUE) OR (\$P_SUB_SPOSA==TRUE)	
N2220	; Positioning the spindle with SPOS:
N2230 SPOS[1]=GP(\$P_SUB_SPOSIT, \$P_SUB_SPOSMODE)	
SPOS[2]=GP(\$P_SUB_SPOSIT, \$P_SUB_SPOSMODE)	
N2250 ELSE	
N2260	; Positioning the spindle using M19:
N2270 M1=19 M2=19	; Position leading and following spindles
N2280 ENDIF	
N2285 DELAYFSTOF	; End of stop delay area
N2290 COUPON(S2,S1)	; Activate synchronous spindle coupling
N2410 ELSE	
N2420	; Query on further replacements
...	
N3300 ENDIF	
...	
N9999 RET	

Supplementary conditions

- The indirect programming of position attributes is not possible in synchronized actions.

References

Function Manual Basic Functions; BAG, Channel, Program Operation, Reset Response (K1),
Section: Replacement of NC functions by subprograms

2.2.4 Indirectly programming part program lines (EXECSTRING)

Using the part program command `EXECSTRING`, it is possible to execute a previously generated string variable as part program line.

Syntax

`EXECSTRING` is programmed in a separate part program line:
`EXECSTRING (<string_variable>)`

Meaning

<code>EXECSTRING:</code>	Command to execute a string variable as part program line
<code><string variable>:</code>	Type <code>STRING</code> variable, that includes the actual part program line to be executed

Note

With `EXECSTRING`, all part program constructions that can be programmed in the **program section of a part program**, with the exception of control structures (Page 113), can be extracted. This means that `PROC` and `DEF` statements are excluded as well as the general use in `INI` and `DEF` files.

Example

Program code	Comment
N100 DEF STRING[100] MY_BLOCK	; Definition of string variables to accept the part program line to be executed.
N110 DEF STRING[10] MFCT1="M7"	
...	
N200 EXECSTRING(MFCT1 << "M4711")	; Execute part program line "M7 M4711".
...	
N300 R10=1	
N310 MY_BLOCK="M3"	
N320 IF(R10)	
N330 MY_BLOCK = MY_BLOCK << MFCT1	
N340 ENDIF	
N350 EXECSTRING(MY_BLOCK)	; Execute part program line "M3 M7".

2.3 Arithmetic functions

Operator / arithmetic function	Meaning
+	Addition
-	Subtraction
*	Multiplication
/ ¹⁾	Division ¹⁾
DIV ¹⁾	Integer number division ¹⁾
MOD ¹⁾	Modulo division (supplies the remainder of the integer number division) ¹⁾
:	Chain operator for FRAME variables
SIN ()	Sine
COS ()	Cosine
TAN ()	Tangent
ASIN ()	Arc sine
ACOS ()	Arc cosine
ATAN2 (,) ¹⁾	Arc tangent2 ¹⁾
SQRT ()	Square root
ABS ()	Absolute value
POT ()	2nd power (square)
TRUNC ()	Integer component The accuracy for comparison commands can be set using TRUNC (see "Precision correction on comparison errors (TRUNC) (Page 78)")
ROUND ()	Round to integer
LN ()	Natural logarithm
EXP ()	Exponential function
MINVAL ()	Lower value of two variables (see "Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND) (Page 80)")
MAXVAL ()	Larger value of two variables (see "Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND) (Page 80)")
BOUND ()	Variable value within the defined value range (see "Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND) (Page 80)")
CTRANS ()	Offset
CROT ()	Rotation
CSCALE ()	Change of scale
CMIRROR ()	Mirroring
1) See the paragraph, "Examples"	

Programming

The usual mathematical notation is used for arithmetic functions. Priorities for execution are indicated by parentheses. Angles are specified for trigonometry functions and their inverse functions (right angle = 90°).

Examples

Division: /

(type REAL) = (type INT or type REAL) / (type INT or type REAL);

Example: $3 / 4 = 0.75$

Integer number division: DIV

(type INT) = (type INT or REAL) / (type INT or REAL);

Example: $7 \text{ DIV } 4.1 = 1$

Modulo division (supplies the remainder of the integer number division): MOD

(type REAL) = (type INT or REAL) MOD (type INT or REAL);

Example: $7 \text{ MOD } 4.1 = 2.9$

Arc tangent 2: ATAN2

The arithmetic function ATAN2 calculates the angle of the total vector from two mutually perpendicular vectors.

The result is in one of four quadrants ($-180^\circ < 0 < +180^\circ$).

The angular reference is always based on the 2nd value in the positive direction.

Programming examples

Program code	Comment
R1=R1+1	; New R1 = old R1 + 1
R1=R2+R3 R4=R5-R6 R7=R8*R9	
R10=R11/R12 R13=SIN(25.3)	
R14=R1*R2+R3	; Multiplication or division takes precedence over addition or subtraction.
R14= (R1+R2) *R3	; Expressions and parentheses are calculated first.
R15=SQRT (POT (R1) +POT (R2))	; Inner parentheses are resolved first: R15 = square root of ((R1^2 + R2^2))
RESFRAME=FRAME1:FRAME2	; FRAME logic operation with chain operator
FRAME3=CTRANS (...) :CROT (...)	Value assignment at a FRAME component

2.4 Comparison and logic operations

Comparison operations can be used, for example, to formulate a jump condition. Complex expressions can also be compared.

The comparison operations are applicable to variables of type `CHAR`, `INT`, `REAL` and `BOOL`. The code value is compared with the `CHAR` type.

For types `STRING`, `AXIS` and `FRAME`, the following are possible: `==` and `<>`, which can be used for `STRING` type operations, even in synchronous actions.

The result of comparison operations is always of `BOOL` type.

Logic operators are used to link truth values.

The logical operations can only be applied to type `BOOL` variables. However, they can also be applied to the `CHAR`, `INT` and `REAL` data types via internal type conversion.

For the logic (Boolean) operations, the following applies to the `BOOL`, `CHAR`, `INT` and `REAL` data types:

- 0 corresponds to: `FALSE`
- Not equal to 0 means: `TRUE`

Bit-by-bit logic operators

Logic operations can also be applied to single bits of types `CHAR` and `INT`. Type conversion is automatic.

Programming

Relational operator	Meaning
<code>==</code>	Equal to
<code><></code>	Not equal to
<code>></code>	Greater than
<code><</code>	Less than
<code>>=</code>	Greater than or equal to
<code><=</code>	Less than or equal to

Logic operator	Meaning
<code>AND</code>	AND
<code>OR</code>	OR
<code>NOT</code>	Negation
<code>XOR</code>	Exclusive OR

Bit-by-bit logic operator	Meaning
<code>B_AND</code>	Bit-by-bit AND
<code>B_OR</code>	Bit-by-bit OR
<code>B_NOT</code>	Bit-by-bit negation
<code>B_XOR</code>	Bit-by-bit exclusive OR

Note

In arithmetic expressions, the execution order of all the operators can be specified by parentheses, in order to override the normal priority rules.

Note

Spaces must be left between BOOLEAN operands and operators.

Note

The operator `B_NOT` only refers to one operand. This is located after the operator.

Examples

Example 1: Comparison operators

```
IF R10>=100 GOTOF DEST
```

or

```
R11=R10>=100  
IF R11 GOTOF DEST
```

The result of the `R10>=100` comparison is first buffered in `R11`.

Example 2: Logic operators

```
IF (R10<50) AND ($AA_IM[X]>=17.5) GOTOF DESTINATION
```

or

```
IF NOT R10 GOTOB START
```

`NOT` only refers to one operand.

Example 3: Bit-by-bit logic operators

```
IF $MC_RESET_MODE_MASK B_AND 'B10000' GOTOF ACT_PLANE
```

2.5 Precision correction on comparison errors (TRUNC)

The TRUNC command truncates the operand multiplied by a precision factor.

Settable precision for comparison commands

Program data of type REAL is displayed internally with 64 bits in IEEE format. This display format can cause decimal numbers to be displayed imprecisely and lead to unexpected results when compared with the ideally calculated values.

Relative equality

To prevent the imprecision caused by the display format from interfering with program flow, the comparison commands do not check for absolute equality, but rather for relative equality.

Syntax

Precision correction on comparison errors

TRUNC (R1*1000)

Meaning

TRUNC:	Truncate decimal places
--------	-------------------------

Relative quality of 10^{-12} taken into account for

- Equality: (==)
- Inequality: (<>)
- Greater than or equal to: (>=)
- Less than or equal to: (<=)
- Greater/less than: (><) with absolute equality
- Greater than: (>)
- Less than: (<)

Compatibility

For compatibility reasons, the check for relative quality for (>) and (<) can be deactivated by setting machine data MD10280 \$MN_PROG_FUNCTION_MASK Bit0 = 1.

Note

Comparisons with data of type REAL are subject to a certain imprecision for the above reasons. If deviations are unacceptable, use INTEGER calculation by multiplying the operands by a precision factor and then truncating with TRUNC.

Synchronized actions

The response described for the comparison commands also applies to synchronized actions.

Examples

Example 1: Precision considerations

Program code	Comments
N40 R1=61.01 R2=61.02 R3=0.01	;Assignment of initial values
N41 IF ABS(R2-R1) > R3 GOTOF ERROR	; Jump would have been executed up until now
N42 M30	; End of program
N43 ERROR: SETAL(66000)	
R1=61.01 R2=61.02 R3=0.01	;Assignment of initial values
R11=TRUNC(R1*1000) R12=TRUNC(R2*1000)	; Accuracy correction
R13=TRUNC(R3*1000)	
IF ABS(R12-R11) > R13 GOTOF ERROR	; Jump is no longer executed
M30	; End of program
ERROR: SETAL(66000)	

Example 2: Calculate and evaluate the quotient of both operands

Program code	Comments
R1=61.01 R2=61.02 R3=0.01	;Assignment of initial values
IF ABS((R2-R1)/R3)-1 > 10EX-5 GOTOF ERROR	; Jump is not executed
M30	; End of program
ERROR: SETAL(66000)	

2.6 Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND)

The **MINVAL** and **MAXVAL** commands compare the values of two variables. The smaller value (in the case of **MINVAL**) or the larger value (in the case of **MAXVAL**) respectively is delivered as a result.

The **BOUND** command tests whether the value of a test variable falls within a defined range of values.

Syntax

```
<smaller value>=MINVAL(<variable1>,<variable2>)
<larger value>=MAXVAL(<variable1>,<variable2>)
<return value>=<BOUND>(<minimum>,<maximum>,<test variable>)
```

Meaning

MINVAL:	Obtains the smaller value of two variables (<variable1>, <variable2>)
<smaller value>:	Result variable for the MINVAL command Set to the smaller variable value.
MAXVAL:	Obtains the larger value of two variables (<variable1>, <variable2>)
<larger value>:	Result variable for the MAXVAL command Set to the larger variable value.
BOUND:	Tests whether a variable (<test variable>) is within a defined range of values.
<minimum>:	Variable which defines the minimum value of the range of values.
<maximum>:	Variable which defines the maximum value of the range of values.
<return value>:	Result variable for the BOUND command If the value of the test variable is within the defined range of values, the result variable is set to the value of the test variable. If the value of the test variable is greater than the maximum value, the result variable is set to the maximum value of the definition range. If the value of the test variable is less than the minimum value, the result variable is set to the minimum value of the definition range.

Note

MINVAL, **MAXVAL**, and **BOUND** can also be programmed in synchronized actions.

Note

Behavior if values are equal

If the values are equal, **MINVAL**/**MAXVAL** are set to this equal value. In the case of **BOUND** the value of the variable to be tested is returned again.

2.6 Variable minimum, maximum and range (MINVAL, MAXVAL and BOUND)

Example

Program code	Comment
DEF REAL rVar1=10.5, rVar2=33.7, rVar3, rVar4, rVar5, rValMin, rValMax, rRetVar	
rValMin=MINVAL(rVar1,rVar2)	; rValMin is set to value 10.5.
rValMax=MAXVAL(rVar1,rVar2)	; rValMax is set to value 33.7.
rVar3=19.7	
rRetVar=BOUND(rVar1,rVar2,rVar3)	; rVar3 is within the limits, rRetVar is set to 19.7.
rVar3=1.8	
rRetVar=BOUND(rVar1,rVar2,rVar3)	; rVar3 is below the minimum limit, rRetVar is set to 10.5.
rVar3=45.2	
rRetVar=BOUND(rVar1,rVar2,rVar3)	; rVar3 is above the maximum limit, rRetVar is set to 33.7.

2.7 Priority of the operations

Each operator is assigned a priority. When an expression is evaluated, the operators with the highest priority are always applied first. Where operators have the same priority, the evaluation is from left to right.

In arithmetic expressions, the execution order of all the operators can be specified by parentheses, in order to override the normal priority rules.

Order of operators

From the highest to lowest priority

1.	NOT, B_NOT	Negation, bit-by-bit negation
2.	*, /, DIV, MOD	Multiplication, division
3.	+, -	Addition, subtraction
4.	B_AND	Bit-by-bit AND
5.	B_XOR	Bit-by-bit exclusive OR
6.	B_OR	Bit-by-bit OR
7.	AND	AND
8.	XOR	Exclusive OR
9.	OR	OR
10.	<<	Concatenation of strings, result type STRING
11.	==, <>, >, <, >=, <=	Comparison operators

Note

The concatenation operator ":" for Frames must not be used in the same expression as other operators. A priority level is therefore not required for this operator.

Example: IF statement

```
If (otto==10) and (anna==20) gotof end
```

2.8 Possible type conversions

Function

Type conversion on assignment

The constant numeric value, the variable, or the expression assigned to a variable must be compatible with the variable type. If this is the case, the type is automatically converted when the value is assigned.

Possible type conversions

	to	REAL	INT	BOOL	CHAR	STRING	AXIS	FRAME
from								
REAL		yes	yes*	Yes ¹⁾	Yes *	–	–	–
INT		yes	yes	Yes ¹⁾	Yes ²⁾	–	–	–
BOOL		yes	yes	yes	yes	yes	–	–
CHAR		yes	yes	Yes ¹⁾	yes	yes	–	–
STRING		–	–	Yes ⁴⁾	Yes ³⁾	yes	–	–
AXIS		–	–	–	–	–	yes	–
FRAME		–	–	–	–	–	–	yes

Explanation

* At type conversion from REAL to INT, fractional values that are ≥ 0.5 are rounded up, others are rounded down (cf. ROUND function).

¹⁾ Value $\neq 0$ is equivalent to TRUE; value $= 0$ is equivalent to FALSE

²⁾ If the value is in the permissible range

³⁾ If only 1 character

⁴⁾ String length 0 = >FALSE, otherwise TRUE

Note

If conversion produces a value greater than the target range, an error message is output.

If mixed types occur in an expression, type conversion is automatic. Type conversions are also possible in synchronous actions, see Chapter "Motion-synchronous actions, implicit type conversion".

2.9 String operations

String operations

In addition to the classic operations "assign" and "comparison" the following string operations are possible:

- Type conversion to STRING (AXSTRING) (Page 84)
- Type conversion from STRING (NUMBER, ISNUMBER, AXNAME) (Page 85)
- Concatenation of strings (<<) (Page 86)
- Conversion to lower/upper case letters (TOLOWER, TOUPPER) (Page 87)
- Determine length of string (STRLEN) (Page 88)
- Search for character/string in the string (INDEX, RINDEX, MINDEX, MATCH) (Page 89)
- Selection of a substring (SUBSTR) (Page 90)
- Reading and writing of individual characters (Page 91)
- Formatting a string (SPRINT) (Page 92)

Special significance of the 0 character

Internally, the 0 character is interpreted as the end identifier of a string. If a character is replaced with the 0 character, the string is truncated.

Example:

Program code	Comment
DEF STRING[20] STRG="axis . stationary"	
STRG[6]="X"	
MSG(STRG)	; Supplies the message "axis X stationary".
STRG[6]=0	
MSG(STRG)	; Supplies the message "axis".

2.9.1 Type conversion to STRING (AXSTRING)

The function "type conversion to STRING" allows variables of different types to be used as a component of a message (MSG).

When using the << operator this is realized implicitly for data types INT, REAL, CHAR and BOOL (see "Concatenation of strings (<<) (Page 86)").

An INT value is converted to normal readable format. REAL values convert with up to 10 decimal places.

Type AXIS variables can be converted to STRING using the AXSTRING command.

Syntax

```
<STRING_RES> = << <any_type>
<STRING_RES> = AXSTRING(<axis identifier>)
```

Meaning

<STRING_RES>:	Variable for the result of the type conversion	
	Type:	STRING
<any_type>:	Variable types INT, REAL, CHAR, STRING and BOOL	
AXSTRING:	The AXSTRING command supplies the specified axis identifier as string.	
<axis identifier>:	Variable for axis identifier	
	Type:	AXIS

Note

FRAME variables cannot be converted.

2.9.2 Type conversion from STRING (NUMBER, ISNUMBER, AXNAME)

A conversion is made from STRING to REAL using the **NUMBER** command. The ability to be converted can be checked using the **ISNUMBER** command.

A string is converted into the axis data type using the **AXNAME** command.

Syntax

```
<REAL_RES>=NUMBER("<string>")
<BOOL_RES>=ISNUMBER("<string>")
<AXIS_RES>=AXNAME("<string>")
```

Meaning

NUMBER:	The NUMBER command returns the number represented by the <string> as REAL value.	
<string>:	Type STRING variable to be converted	
<REAL_RES>:	Variable for the result of the type conversion with NUMBER	
	Type:	REAL
ISNUMBER:	The ISNUMBER command checks whether the <string> can be converted into a valid number.	

<BOOL_RES>:	Variable for the result of the interrogation with ISNUMBER		
	Type:	BOOL	
	Value:	TRUE	ISNUMBER supplies the value TRUE, if the <string> represents a valid REAL number in compliance with the language rules.
		FALSE	If ISNUMBER supplies the value FALSE, when calling NUMBER with the same <string>, an alarm is initiated.
AXNAME:	The AXNAME command converts the specified <string> into an axis identifier. Note: If the <string> cannot be assigned a configured axis identifier, an alarm is initiated.		
<AXIS_RES>:	Variable for the result of the type conversion with AXNAME		
	Type:	AXIS	

Example

Program code	Comment
DEF BOOL BOOL_RES	
DEF REAL REAL_RES	
DEF AXIS AXIS_RES	
REAL_RES == 1234.9876Ex-7	; BOOL_RES == TRUE
BOOL_RES=ISNUMBER("1234XYZ")	; BOOL_RES == FALSE
REAL_RES=NUMBER("1234.9876Ex-7")	; REAL_RES == 1234.9876Ex-7
AXIS_RES=AXNAME("X")	; AXIS_RES == X

2.9.3 Concatenation of strings (<<)

The function "concatenation strings" allows a string to be configured from individual components.

The concatenation is realized using the operator "<<". This operator has STRING as the target type for all combinations of basic types CHAR, BOOL, INT, REAL, and STRING. Any conversion that may be required is carried out according to existing rules.

Syntax

```
<any_type> << <any_type>
```

Meaning

<any_type>:	Variable, type CHAR, BOOL, INT, REAL or STRING
<< :	Operator to chain variables (<any_type>) to configure a character string (type STRING). This operator is also available alone as a so-called "unary" variant. This can be used for explicit type converter to STRING (not for FRAME and AXIS): << <any_type>

For example, such a message or a command can be configured from text lists and parameters can be inserted (for example a block name):

```
MSG (STRG_TAB[LOAD_IDX]<<BLOCK_NAME)
```

Note

The intermediate results of string concatenation must not exceed the maximum string length.

Note

The FRAME and AXIS types cannot be used together with the operator "<<".

Examples

Example 1: Concatenation of strings

Program code	Comment
DEF INT IDX=2	
DEF REAL VALUE=9.654	
DEF STRING[20] STRG="INDEX:2"	
IF STRG=="Index:"<<IDX GOTO NO_MSG	
MSG("Index:"<<IDX<<"/value:"<<VALUE)	; Display: "Index:2/value:9.654"
NO_MSG:	

Example 2: Explicit type conversion with <<

Program code	Comment
DEF REAL VALUE=3.5	
<<VALUE	; The specified REAL type variable is converted into a STRING type.

2.9.4 Conversion to lower/upper case letters (TOLOWER, TOUPPER)

The "conversion to lowercase/uppercase letters" function allows all of the letters of a string to be converted into a standard representation.

Syntax

```
<STRING_RES>=TOUPPER("<string>")
<STRING_RES>=TOLOWER("<string>")
```

Meaning

TOUPPER:	Using the <code>TOUPPER</code> command, all of the letters in a character string are converted into uppercase letters.	
TOLOWER:	Using the <code>TOLOWER</code> command, all of the letters in a character string are converted into lowercase letters.	
<string>:	Character string that is to be converted	
	Type:	STRING
<STRING_RES>:	Variable for the result of the conversion	
	Type:	STRING

Example

Because user inputs can be initiated on the user interface, they can be given standard capitalization (uppercase or lowercase):

Program code

```
DEF STRING [29] STRG
...
IF "LEARN.CNC"==TOUPPER(STRG) GOTOF LOAD_LEARN
```

2.9.5 Determine length of string (STRLEN)

The `STRLEN` command determines the length of a character string.

Syntax

```
<INT_RES>=STRLEN("<STRING>")
```

Meaning

STRLEN:	The <code>STRLEN</code> command determines the length of the specified character string. The number of characters that are not the 0 character, counting from the beginning of the string is returned.	
<string>:	Character string whose length is to be determined	
	Type:	STRING
<INT_RES>:	Variable for the result of the determination	
	Type:	INT

Example

In conjunction with the single character access, this function allows the end of a character string to be determined:

Program code

```
IF (STRLEN(BLOCK_NAME)>10) GOTO ERROR
```

2.9.6

Search for character/string in the string (INDEX, RINDEX, MINDEX, MATCH)

This functionality searches for single characters or a string within a string. The function results specify where the character/string is positioned in the string that has been searched.

Syntax

INT_RES=INDEX (STRING, CHAR) ; **Result type: INT**

INT_RES=RINDEX (STRING, CHAR) ; **Result type: INT**

INT_RES=MINDEX (STRING, STRING) ; **Result type: INT**

INT_RES=MINDEX (STRING, STRING) ; **Result type: INT**

Semantics

Search functions: It supplies the position in the string (first parameter) where the search has been successful. If the character/string cannot be found, then the value -1 is returned. The first character has position 0.

Meaning

INDEX:	Searches for the character specified as second parameter (from the beginning) in the first parameter.
RINDEX:	Searches for the character specified as second parameter (from the end) in the first parameter.
MINDEX:	Corresponds to the INDEX function, except for the case that a list of characters is transferred (as string) in which the index of the first found character is returned.
MATCH:	Searches for a string in a string.

This allows strings to be broken up according to certain criteria, for example, at positions with blanks or path separators ("/").

Example

Breaking up an input into path and block names

Program code	Comment
DEF INT PFADIDX, PROGIDX	
DEF STRING[26] INPUT	
DEF INT LISTIDX	

Program code	Comment
INPUT = "/_N_MPF_DIR/_N_EXECUTE_MPF"	
LISTIDX = MINDEX (INPUT, "M,N,O,P") + 1	; The value returned in LISTIDX is 3; because "N" is the first character in the parameter IN- PUT from the selection list starting from the beginning.
PFADIDX = INDEX (INPUT, "/") +1	; Therefore the following applies: PFADIDX = 1
PROGIDX = RINDEX (INPUT, "/") +1	; Therefore the following applies: PROGIDX = 12
	; The SUBSTR function introduced in the next section can be used to break-up variable INPUT into the components "path" and "module":
VARIABLE = SUBSTR (INPUT, PFADIDX, PROGIDX-PFADIDX-1)	; Then returns "_N_MPF_DIR"
VARIABLE = SUBSTR (INPUT, PROGIDX)	; Then returns "_N_EXECUTE_MPF"

2.9.7 Selection of a substring (SUBSTR)

Arbitrary parts within a string can be read with the SUBSTRING function.

Syntax

```
<STRING_RES>=SUBSTR(<string>,<index>,<length>)  
<STRING_RES>=SUBSTR(<string>,<index>)
```

Meaning

SUBSTR:	This function returns a substring from <string>, starting with <index> with the specified <length>. If the parameter <length> is not specified, the function returns a substring starting with <index> until the end of the string.
<index>:	Start position of the substring within the string. If the start position is after the end of the string, an empty string (" ") is returned. First character of the string: Index = 0 Range of values: 0 ... (string length - 1)
<length>:	Length of the substring. If too long a length is specified, only the substring up to the end of the string is returned. Range of values: 1 ... (string length - 1)

Example

Program code	Comment
DEF STRING[29] RES	
;	1
;	0123456789012345678
RES = SUBSTR("QUITUNG: 10 to 99", 10, 2)	; RES == "10"

Program code	Comment
RES = SUBSTR("QUITTING: 10 to 99", 10)	; RES == "10 to 99"

2.9.8 Reading and writing of individual characters

Individual characters can be read and written within a string.

The following supplementary conditions must be observed:

- Only possible with user-defined variables, not with system variables
- Individual characters of a string are only transferred "call by value" for subprogram calls

Syntax

```
<Character>=<string>[<index>]
<Character>=<string_array>[<array_index>,<index>]
<String>[<index>]=<character>
<String_array>[<array_index>,<index>]=<character>
```

Meaning

<string>:	Any string
<character>:	Variable of type CHAR
<index>:	Position of the character within the string. First character of the string: Index = 0 Range of values: 0 ... (string length - 1)

Examples

Example 1: Variable message

Program code	Comment
; 0123456789	
DEF STRING [50] MESSAGE = "Axis n has reached position"	
MESSAGE [6] = "X"	
MSG (MESSAGE)	; "Axis X has reached position"

Example 2: Evaluating a system variable

Program code	Comment
DEF STRING[50] STRG	; Buffer for system variable
...	
STRG = \$P_MMCA	; Load system variable
IF STRG[0] == "E" GOTO ...	; Evaluating the system variable

Example 3: Parameter transfer "call by value" and "call by reference"

Program code	Comment
; 0123456	
DEF STRING[50] STRG = "Axis X"	
DEF CHAR CHR	
...	
EXTERN UP_VAL(ACHSE)	; Definition of subprogram with "call by value" parameters
EXTERN UP_REF(VAR ACHSE)	; Definition of subprogram with "call by reference" parameters
...	
UP_VAL(STRG[6])	; Parameter transfer "by value"
...	
CHR = STRG[6]	; Buffer
UP_REF(CHR)	; Parameter transfer "by reference"

2.9.9 Formatting a string (SPRINT)

Using the pre-defined SPRINT function, character strings can be formatted and e.g. prepared for output on external devices (also see "Process DataShare - Output to an external device/ file (EXTOPEN, WRITE, EXTCLOSE): (Page 659)").

Syntax

```
"<Result_string>"=SPRINT("<Format_string>",<value_1>,<value_2>,...,
<value_n>)
```

Meaning

SPRINT:	Identifier for a pre-defined function that supplies a value, type STRING.
"<Format_string>":	Character string that contains fixed and variable elements. The variable elements are defined using the format control character % and a subsequent format description.
< value_1>,< value_2>,...,< value_n>:	Value in the form of a constant or NC variables, which is inserted at the location where the nth format control character % is located, corresponding to the format description in the <format_string>.
"<result_string>":	Formatted character string (maximum 400 bytes)

Format descriptions available

%B:	<p>Conversion into the "TRUE" string, if the value to be converted:</p> <ul style="list-style-type: none"> • Is not equal to 0. • Is not an empty string (for string values). <p>Conversion into the "FALSE" string, if the value to be converted:</p> <ul style="list-style-type: none"> • Is equal to 0. • Is an empty string. <p>Example:</p> <pre>N10 DEF BOOL BOOL_VAR=1 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF BOOL_VAR:%B", BOOL_VAR)</pre> <p>Result: The character string "CONTENT OF BOOL_VAR:TRUE" is written to the RESULT string variable.</p>
%C:	<p>Conversion into an ASCII character.</p> <p>Example:</p> <pre>N10 DEF CHAR CHAR_VAR="X" N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF CHAR_VAR:%C", CHAR_VAR)</pre> <p>Result: The character string "CONTENT OF CHAR_VAR:X" is written to the string variable RESULT.</p>
%D:	<p>Conversion into a string with an integer value (INTEGER).</p> <p>Example:</p> <pre>N10 DEF INT INT_VAR=123 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF INT_VAR:%D", INT_VAR)</pre> <p>Result: The character string "CONTENT OF INT_VAR:123" is written to the string variable RESULT.</p>
%<m>D:	<p>Conversion into a string with an integer value (INTEGER). The string has a minimum length of <m> characters. The missing locations are filled with spaces, left-justified.</p> <p>Example:</p> <pre>N10 DEF INT INT_VAR=-123 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF INT_VAR:%6D", INT_VAR)</pre> <p>Result: The character string "CONTENT OF INT_VAR:xx-123" is written to string variable RESULT ("x" in the example represents spaces).</p>
%F:	<p>Conversion into a string with a decimal number with 6 decimal places. Where relevant, the decimal places are rounded-off or filled with 0.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1.2341234EX+03 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%F", REAL_VAR)</pre> <p>Result: The string variable RESULT is written with the character string "CONTENT OF REAL_VAR: -1234.123400".</p>

%<m>F:	<p>Conversion into a string with a decimal number with 6 decimal places and a total length of at least <m> characters. Where relevant, the decimal places are rounded-off or filled with 0. Missing characters are filled up to the total length <m> using spaces, left-justified.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1.23412345678EX+03 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%15F",REAL_VAR)</pre> <p>Result: The string variable RESULT is written with the character string "CONTENT OF REAL_VAR: xxx-1234.123457" (where "x" is a placeholder for space).</p>
%.<n>F:	<p>Conversion into a string with a decimal number with <n> decimal places. Where relevant, the decimal places are rounded-off or filled with 0.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1.2345678EX+03 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%.3F",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:-1234.568" is written to the string variable RESULT.</p>
%<m>.<n>F:	<p>Conversion into a string with a decimal number with <n> decimal places and a total length of at least <m> characters. Where relevant, the decimal places are rounded-off or filled with 0. Missing characters are filled up to the total length <m> using spaces, left-justified.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1.2341234567890EX+03 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%10.2F",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xx-1234.12" is written to the string variable RESULT ("x" in the example represents spaces).</p>
%E:	<p>Conversion into a string with a decimal number in the exponential representation. The mantissa is saved, normalized with one pre-decimal place and 6 decimal places. Where relevant, the decimal places are rounded-off or filled with 0. The exponent starts with the keyword "EX". It is followed by the sign ("+" or "-") and a two or three-digit number.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1234.567890 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%E",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:-1.234568EX+03" is written to the string variable RESULT.</p>
%<m>E:	<p>Conversion into a string with a decimal number in the exponential representation and a total length of at least <m> characters. The missing characters are filled with spaces, left-justified. The mantissa is saved, normalized with one pre-decimal place and 6 decimal places. Where relevant, the decimal places are rounded-off or filled with 0. The exponent starts with the keyword "EX". It is followed by the sign ("+" or "-") and a two or three-digit number.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1234.5 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%20E",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xxxxxx-1.234500EX+03" is written to the string variable RESULT ("x" in the example represents spaces).</p>

%.<n>E:	<p>Conversion into a string with a decimal number in the exponential representation. The mantissa is saved, normalized with one pre-decimal place and <n> decimal places. Where relevant, the decimal places are rounded-off or filled with 0. The exponent starts with the keyword "EX". It is followed by the sign ("+" or "-") and a two or three-digit number.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1234.5678 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%.2E",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:-1.23EX+03" is written to the string variable RESULT.</p>
%<m>.<n>E:	<p>Conversion into a string with a decimal number in the exponential representation and a total length of at least <m> characters. The missing characters are filled with spaces, left-justified. The mantissa is saved, normalized with one pre-decimal place and <n> decimal places. Where relevant, the decimal places are rounded-off or filled with 0. The exponent starts with the keyword "EX". It is followed by the sign ("+" or "-") and a two or three-digit number.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-1234.5678 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%12.2E", REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xx-1.23EX+03" is written to the string variable RESULT ("x" in the example represents spaces).</p>
%G:	<p>Conversion into a string with a decimal number – depending on the value range – in a decimal or exponential representation: If the absolute value to be represented is less than 1.0EX-04 or greater than/equal to 1.0EX+06, then the exponential notation is selected, otherwise the decimal notation. A maximum of six significant places are displayed or if required, rounded-off.</p> <p>Example with decimal notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX-04 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:0.000123457" is written to the string variable RESULT.</p> <p>Example with exponential notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX+06 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:1.23457EX+06" is written to the string variable RESULT.</p>

%<m>G:	<p>Conversion into a string with a decimal number – depending on the value range – in a decimal or exponential notation (like %G). The string has a total length of at least <m> characters. The missing characters are filled with spaces, left-justified.</p> <p>Example with decimal notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX-04 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%15G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xxx0.000123457" is written to the string variable RESULT ("x" in the example represents spaces).</p> <p>Example with exponential notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX+06 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%15G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xxx1.23457EX+06" is written to the string variable RESULT ("x" in the example represents spaces).</p>
%.<n>G:	<p>Conversion into a string with a decimal number – depending on the value range – in a decimal or exponential representation. A maximum of <n> significant places are displayed or if required, rounded-off. If the absolute value to be represented is less than 1.0EX-04 or greater than/equal to 1.0EX(+<n>), then the exponential notation is selected, otherwise the decimal notation.</p> <p>Example with decimal notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX-04 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%.3G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:0.000123" is written to the string variable RESULT.</p> <p>Example with exponential notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX+03 N20 DEF STRING[80] RESULT N30 RESULT = SPRINT("CONTENT OF REAL_VAR:%.3G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:1.23EX+03" is written to the string variable RESULT.</p>
%<m>.<n>G:	<p>Conversion into a string with a decimal number – depending on the value range – in a decimal or exponential notation (like %.<n>G). The string has a total length of at least <m> characters. The missing characters are filled with spaces, left-justified.</p> <p>Example with decimal notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX-04 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%12.4G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xxx0.0001235" is written to the string variable RESULT ("x" in the example represents spaces).</p> <p>Example with exponential notation:</p> <pre>N10 DEF REAL REAL_VAR=1.234567890123456EX+04 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF REAL_VAR:%12.4G",REAL_VAR)</pre> <p>Result: The character string "CONTENT OF REAL_VAR:xx1.235EX+06" is written to the string variable RESULT ("x" in the example represents spaces).</p>

%.<n>P:	<p>Converting a REAL value into an INTEGER value taking into account <n> decimal places. The INTEGER value is output as a 32-bit binary number. If the value to be converted cannot be represented with 32 bits, then processing is interrupted with an alarm.</p> <p>As a byte sequence generated using the format statement %.<n>P can also contain binary zeroes, then the total string that is generated in this way no longer corresponds to the conventions of the NC data type STRING. As a consequence, it can neither be saved in a variable, type STRING, nor be further processed using the string commands of the NC language. The only possible use is to transfer the parameter to the WRITE command with output at an appropriate external device (see the following example).</p> <p>As soon as the <Format_String> contains a format description, type %P then the complete string, with the exception of the binary number generated with %.<n>P, is output corresponding to the MD10750 \$MN_SPRINT_FORMAT_P_CODE in the ASCII character code, ISO (DIN6024) or EIA (RS244). If a character that cannot be converted is programmed, then processing is interrupted with an alarm.</p> <p>Example:</p> <pre> N10 DEF REAL REAL_VAR=123.45 N20 DEF INT ERROR N30 DEF STRING[20] EXT_DEVICE="/ext/dev/1" ... N100 EXTOPEN(ERROR,EXT_DEVICE) N110 IF ERROR <> 0 ... ; error handling N200 WRITE(ERROR,EXT_DEVICE,SPRINT("INTEGER BINARY CODED:%. 3P",REAL_VAR) N210 IF ERROR <> 0 ... ; error handling </pre> <p>Result: The string "INTEGER BINARY CODED: 'H0001E23A'" is transferred to the output device /ext/dev/1. The hexadecimal value 0x0001E23A corresponds to the decimal value 123450.</p>
---------	--

%<m>.<n>P:	<p>Conversion of a REAL value corresponding to the setting in machine data MD10751 \$MN_SPRINT_FORMAT_P_DECIMAL into a string with:</p> <ul style="list-style-type: none"> • An integer of <m> + <n> places or • A decimal number with a maximum of <m> pre-decimal places and precisely <n> decimal places. <p>Just the same as for the format description %.<n>P, the complete string is saved in the character code defined by MD10750 \$MN_SPRINT_FORMAT_P_CODE.</p> <p>Conversion for MD10751 = 0:</p> <p>The REAL value is converted into a string with an integer number of <m> + <n> places. If required, decimal places are rounded-off to <n> places or filled with 0. The missing pre-decimal places are filled with spaces. The minus sign is attached, left-justified; a space is entered instead of the plus sign.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR=-123.45 N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("PUNCHED TAPE FORMAT:%5.3P",REAL_VAR)</pre> <p>Result: The character string "PUNCHED TAPE FORMAT:-xx123450" is written to the string variable RESULT ("x" in the example represents spaces).</p> <p>Conversion for MD10751 = 1:</p> <p>The REAL value is converted into a string with a decimal number with a maximum of <m> pre-decimal places and precisely <n> decimal places. Where necessary, the pre-decimal places are cut-off and the decimal places are rounded-off or filled with 0. If <n> is equal to 0, then the decimal point is also omitted.</p> <p>Example:</p> <pre>N10 DEF REAL REAL_VAR1=-123.45 N20 DEF REAL REAL_VAR2=123.45 N30 DEF STRING[80] RESULT N40 RESULT=SPRINT("PUNCHED TAPE FORMAT:%5.3P VAR2:%2.0P", REAL_VAR1,REAL_VAR2)</pre> <p>Result: The character string "PUNCHED TAPE FORMAT:-123.450 VAR2:23" is written to the string variable RESULT.</p>
%S:	<p>Inserting a string.</p> <p>Example:</p> <pre>N10 DEF STRING[16] STRING_VAR="ABCDEFGH" N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF STRING_VAR:%S",STRING_VAR)</pre> <p>Result: The character string "CONTENT OF STRING_VAR:ABCDEFGH" is written to the string variable RESULT.</p>
%<m>S:	<p>Inserting a string with a minimum of <m> characters. The missing places are filled with spaces.</p> <p>Example:</p> <pre>N10 DEF STRING[16] STRING_VAR="ABCDEFGH" N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF STRING_VAR:%10S",STRING_VAR)</pre> <p>Result: The character string "CONTENT OF STRING_VAR:xxxABCDEFGH" is written to the string variable RESULT ("x" in the example represents spaces).</p>

%.<n>S:	<p>Inserting <n> characters of a string (starting with the first character).</p> <p>Example:</p> <pre>N10 DEF STRING[16] STRING_VAR="ABCDEFGH" N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF STRING_VAR:%.3S", STRING_VAR)</pre> <p>Result: The character string "CONTENT OF STRING_VAR:ABC" is written to the string variable RESULT.</p>
%<m>.<n>S:	<p>Inserting <n> characters of a string (starting with the first character). The total length of the generated string has at least <m> characters. The missing places are filled with spaces.</p> <p>Example:</p> <pre>N10 DEF STRING[16] STRING_VAR="ABCDEFGH" N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("CONTENT OF STRING_VAR:%10.5S", STRING_VAR)</pre> <p>Result: The character string "CONTENT OF STRING_VAR:xxxxxABCDE" is written to the string variable RESULT ("x" in the example represents spaces).</p>
%X:	<p>Converting an INTEGER value into a string with the hexadecimal notation.</p> <p>Example:</p> <pre>N10 DEF INT INT_VAR='HA5B8' N20 DEF STRING[80] RESULT N30 RESULT=SPRINT("INTEGER HEXADECIMAL:%X", INT_VAR)</pre> <p>Result: The character string "INTEGER HEXADECIMAL:A5B8" is written to the string variable RESULT.</p>

Note

A property of the NC language, where a distinction is not made between uppercase and lowercase letters for identifiers and keywords, also applies to the format descriptions. As a consequence, you can program using either lowercase or uppercase letters without any functional difference.

Combination options

The following table provides information as to which NC data types can be combined with which format description. The rules regarding implicit data type conversion apply (see "Data types (Page 58)").

	NC data types						
	BOOL	CHAR	INT	REAL	STRING	AXIS	FRAME
%B	+	+	+	+	+	-	-
%C	-	+	-	-	+	-	-
%D	+	+	+	+	-	-	-
%F	-	-	+	+	-	-	-
%E	-	-	+	+	-	-	-
%G	-	-	+	+	-	-	-
%S	-	+	-	-	+	-	-
%X	+	+	+	-	-	-	-
%P	-	-	+	+	-	-	-

Note

The table indicates that the NC data types AXIS and FRAME cannot be directly used in the SPRINT function. However it is possible:

- To convert the AXIS data type into a string using the AXSTRING function – which can then be processed with SPRINT.
 - To read the individual values of the FRAME data type per frame component access. As a consequence, a REAL data type is obtained, which can be processed with SPRINT.
-

2.10 Program jumps and branches

2.10.1 Return jump to the start of the program (GOTOS)

The `GOTOS` command can be used to jump back to the beginning of a main or subprogram in order to repeat the program.

Machine data can be used to set that for every return jump is made to the program start:

- The program runtime is set to "0".
- Workpiece counting is incremented by the value "1".

Syntax

`GOTOS`

Meaning

GOTOS:	Jump statement where the destination is the beginning of the program.	
	The execution is controlled via the NC/PLC interface signal: DB21, to DBX384.0 (control program branching)	
	Value:	Meaning:
	0	No return jump to the beginning of the program. Program execution is resumed with the next part program block after <code>GOTOS</code> .
	1	Return jump to the beginning of the program. The part program is repeated.

Supplementary conditions

- `GOTOS` internally initiates a `STOPRE` (pre-processing stop).
- For a subprogram with data definitions (LUD variables) with the `GOTOS`, a jump is made to the first program block after the definition section, i.e. data definitions are not executed again. This is the reason that the defined variables retain the value reached in the `GOTOS` block and are not reset to the standard values programmed in the definition section.
- The `GOTOS` command is not available in synchronized actions and technology cycles.

Example

Program code	Comment
N10 ...	; Start of the program.
...	
N90 GOTOS	; Jump to beginning of the program.
...	

2.10.2 Program jumps to jump markers (GOTOB, GOTOF, GOTO, GOTOC)

Jump labels can be set in a program, which can be jumped to from another location within the same program using the commands `GOTOF`, `GOTOB`, `GOTO`, or `GOTOC`. Program execution is resumed with the statement that immediately follows the jump label. This means that branches can be realized within the program.

In addition to jump labels, main and sub-block numbers are possible as jump designation.

If a jump condition (`IF . . .`) is formulated before the jump statement, the program jump is only executed if the jump condition is fulfilled.

Syntax

```
GOTOB <jump destination>
IF <jump condition> == TRUE GOTOB <jump destination>

GOTOF <jump destination>
IF <jump condition> == TRUE GOTOF <jump destination>

GOTO <jump destination>
IF <jump condition> == TRUE GOTO <jump destination>

GOTOC <jump destination>
IF <jump condition> == TRUE GOTOC <jump destination>
```

Meaning

GOTOB:	Jump statement with jump destination toward the beginning of the program.	
GOTOF:	Jump statement with jump destination toward the end of the program.	
GOTO:	Jump statement with jump destination search. The search is first made in the direction of the end of the program, then in the direction of the beginning of the program.	
GOTOC:	Same effect as for GOTO with the difference that Alarm 14080 "Jump designation not found" is suppressed. This means that program execution is not interrupted in the case that the jump destination search is unsuccessful – but is continued with the program line following the GOTOC command.	
<jump destination>:	Jump destination parameter Possible data include:	
	<jump label>:	Jump destination is the jump label set in the program with a user-defined name:<jump label>:
	<block number>:	Jump destination is main block or sub-block number (e.g.: 200, N300)
	STRING type variable:	Variable jump destination. The variable stands for a jump label or a block number.
IF:	Keyword to formulate the jump condition. The jump condition permits all comparison and logical operations (result: TRUE or FALSE). The program jump is executed if the result of this operation is TRUE.	

Note

Jump labels

Jump labels are always located at the beginning of a block. If a program number exists, the jump label is located immediately after the block number.

The following rules apply when naming jump labels:

- Number of characters:
 - Minimum 2
 - Maximum 32
 - Permissible characters are:
 - Letters
 - Numbers
 - Underscores
 - The first two characters must be letters or underscores.
 - The name of the jump label is followed by a colon (":").
-

Supplementary conditions

- The jump destination can only be a block with jump label or block number that is located **within** the program.
- A jump statement without jump condition must be programmed in a separate block. This restriction does not apply to jump statements with jump conditions. In this case, several jump statements can be formulated in a block.
- For programs with jump statements without jump conditions, the end of the program M2/M30 does not necessarily be at the end of the program.

Examples

Example 1: Jumps to jump labels

Program code	Comment
N10 ...	
N20 GOTOF Label_1	; Jump toward end of program to ; jump label "Label_1".
N30 ...	
N40 Label_0: R1=R2+R3	; Jump label "Label_0" set.
N50 ...	
N60 Label_1:	; Jump label "Label_1" set.
N70 ...	
N80 GOTOB Label_0	; Jump toward beginning of program ; to the jump label "Label_0."
N90 ...	

Example 2: Indirect jump to the block number

Program code	Comment
IF <condition> == TRUE	
R10=100	; Assign jump destination
ELSE	
R10=110	; Assign jump destination
ENDIF	
; Jump toward end of program to the block whose block number is located in R10	
N10 GOTOF "N"<<R10	
...	
N90 ...	
N100 ...	; Jump destination
N110 ...	
...	

Example 3: Jump to variable jump destination

Program code	Comment
DEF STRING[20] DESTINATION	
IF <condition> == TRUE	
DESTINATION = "Label1"	; Assign jump destination
ELSE	
DESTINATION = "Label2"	; Assign jump destination
ENDIF	
; Jump toward end of program to the variable jump destination "Content of DESTINATION."	
GOTOF DESTINATION	
Label1: T="Drill1"	; Jump destination 1
...	
Label2: T="Drill2"	; Jump destination 2
...	

Example 4: Jump with jump condition

Program code	Comment
N40 R1=30 R2=60 R3=10 R4=11 R5=50 R6=20	; Assignment of the initial values
N41 LA1: G0 X=R2*COS(R1)+R5 Y=R2*SIN(R1)+R6	; Jump label LA1
N42 R1=R1+R3 R4=R4-1	
; IF jump condition == TRUE	
; THEN jump toward beginning of program to the jump label LA1	
N43 IF R4>0 GOTOB LA1	
N44 M30	; End of program

2.10.3 Program branch (CASE ... OF ... DEFAULT ...)

The CASE function provides the possibility of checking the actual value (type: INT) of a variable or an arithmetic function and, depending on the result, to jump to different positions in the program.

Syntax

```
CASE(<expression>) OF <constant_1> GOTOF <jump target_1>
<constant_2> GOTOF <jump target_2> ... DEFAULT GOTOF <jump target_n>
```

Meaning

CASE:	Jump statement	
<expression>:	Variable or arithmetic function	
OF:	Keyword to formulate conditional program branches.	
<constant_1>:	First specified constant value for the variable or arithmetic function	
	Type:	INT
<constant_2>:	Second specified constant value for the variable or arithmetic function	
	Type:	INT
DEFAULT:	For the cases where the variable or arithmetic function does not assume any of the specified constant values, the DEFAULT statement can be used to determine the jump target. Note: If the DEFAULT statement is not programmed, then in these cases, the block following the CASE statement is the jump target.	
GOTOF:	Jump statement with jump target towards the end of the program. Instead of GOTOF all other GOTO commands can be programmed (refer to the subject "Program jumps to jump markers").	
<jump target_1>:	A branch is made to this jump target if the value of the variable or arithmetic function corresponds to the first specific constant. The jump target can be specified as follows:	
	<jump marker>:	Jump target is the jump marker (label) set in the program with a user-defined name: <jump marker>:
	<block number>:	Jump target is main block or sub-block number (e.g.: 200, N300)
	STRING type variable:	Variable jump target. The variable stands for a jump marker or a block number.
<jump target_2>:	A branch is made to this jump target if the value of the variable or arithmetic function corresponds to the second specified constant.	
<jump target_n>:	A branch is made to this jump target if the value of the variable does not assume the specified constant value.	

Example

Program code
...

Program code

```
N20 DEF INT VAR1 VAR2 VAR3
N30 CASE (VAR1+VAR2-VAR3) OF 7 GOTO Label_1 9 GOTO Label_2
    Label_2 DEFAULT GOTO Label_3
N40 Label_1: G0 X1 Y1
N50 Label_2: G0 X2 Y2
N60 Label_3: G0 X3 Y3
...
```

The CASE statement from N30 defines the following program branch possibilities:

1. If the value of the arithmetic function $\text{VAR1} + \text{VAR2} - \text{VAR3} = 7$, then jump to the block with the jump marker definition "Label_1" (\rightarrow N40).
2. If the value of the arithmetic function $\text{VAR1} + \text{VAR2} - \text{VAR3} = 9$, then jump to the block with the jump marker definition "Label_2" (\rightarrow N50).
3. If the value of the arithmetic function $\text{VAR1} + \text{VAR2} - \text{VAR3}$ is neither 7 nor 9, then jump to the block with the jump marker definition "Label_3" (\rightarrow N60).

2.11 Repeat program section (REPEAT, REPEATB, ENDLABEL, P)

Program section repetition allows you to repeat existing program sections within a program in any order.

The program lines or program sections to be repeated are identified by jump markers (labels).

Note

Jump markers (labels)

Jump markers are always located at the beginning of a block. If a program number exists, the jump marker is located immediately after the block number.

The following rules apply when naming jump markers:

- Number of characters:
 - Minimum 2
 - Maximum 32
 - Permissible characters are:
 - Letters
 - Numbers
 - Underscores
 - The first two characters must be letters or underscores.
 - The name of the jump marker is followed by a colon (":").
-

Syntax

1. Repeat individual program line:

```
<jump marker>: ...
...
REPEATB <jump marker> P=<n>
...
```

2. Repeat program section between jump marker and REPEAT statement:

```
<jump marker>: ...
...
REPEAT <jump marker> P=<n>
...
```

3. Repeat section between two jump markers:

```
<start jump marker>: ...
...
<end jump marker>: ...
...
REPEAT <start jump marker> <end jump marker> P=<n>
...
```

Note

It is not possible to nest the REPEAT statement with the two jump markers in parentheses. If the <start jump marker> appears before the REPEAT statement and the <end jump marker> is not reached before the REPEAT statement, the section between the <start jump marker> and the REPEAT statement will be repeated.

4. Repeat section between jump marker and ENDLABEL:

```
<jump marker>: ...
...
ENDLABEL: ...
...
REPEAT <jump marker> P=<n>
...
```

Note

It is not possible to nest the REPEAT statement with the <jump marker> and the ENDLABEL in parentheses. If the <jump marker> appears before the REPEAT statement and the ENDLABEL is not reached before the REPEAT statement, the section between the <jump marker> and the REPEAT statement will be repeated.

Meaning

REPEATB:	Command for repeating a program line
REPEAT:	Command for repeating a program section
<jump marker>:	<p>The <jump marker> identifies:</p> <ul style="list-style-type: none"> • The program line to be repeated (in the case of REPEATB) or • The start of the program section to be repeated (in the case of REPEAT) <p>The program line identified by the <jump marker> can appear before or after the REPEAT/REPEATB statement. The search initially commences toward the start of the program. If the jump marker is not found in this direction, the search continues working toward the end of the program.</p> <p>Exception: If the program section between the jump marker and the REPEAT statement needs to be repeated (see 2. under Syntax), the program line identified by the <jump marker> has to appear before the REPEAT statement, since in this case the search runs only toward the beginning of the program.</p> <p>If the line with the <jump marker> contains further operations, these are executed again on each repetition.</p>
ENDLABEL:	<p>Keyword marking the end of a program section to be repeated.</p> <p>If the line with the ENDLABEL contains further operations, these are executed again on each repetition.</p> <p>ENDLABEL can be used more than once in the program.</p>

2.11 Repeat program section (REPEAT, REPEATB, ENDLABEL, P)

P:	Address for specifying the number of repetitions	
<n>:	Number of program section repetitions	
	Type:	INT
	<p>The program section to be repeated is repeated <n> times. After the last repetition, the program is resumed at the line following the REPEAT/REPEATB line.</p> <p>Note: In the absence of a number being specified for P=<n>, the program section is repeated just once.</p>	

Examples

Example 1: Repeat individual program line

Program code	Comment
N10 POSITION1: X10 Y20	
N20 POSITION2: CYCLE(0,,9,8)	;Position cycle
N30 ...	
N40 REPEATB POSITION1 P=5	; Execute BLOCK N10 five times.
N50 REPEATB POSITION2	; Execute block N20 once.
N60 ...	
N70 M30	

Example 2: Repeat program section between jump marker and REPEAT statement:

Program code	Comment
N5 R10=15	
N10 Begin: R10=R10+1	;Width
N20 Z=10-R10	
N30 G1 X=R10 F200	
N40 Y=R10	
N50 X=-R10	
N60 Y=-R10	
N70 Z=10+R10	
N80 REPEAT BEGIN P=4	; Execute section from N10 to N70 four times.
N90 Z10	
N100 M30	

Example 3: Repeat section between two jump markers

Program code	Comment
N5 R10=15	
N10 Begin: R10=R10+1	;Width
N20 Z=10-R10	
N30 G1 X=R10 F200	
N40 Y=R10	
N50 X=-R10	

2.11 Repeat program section (REPEAT, REPEATB, ENDLABEL, P)

Program code	Comment
N60 Y--R10	
N70 END: Z=10	
N80 Z10	
N90 CYCLE(10,20,30)	
N100 REPEAT BEGIN END P=3	; Execute section from N10 to N70 three times.
N110 Z10	
N120 M30	

Example 4: Repeat section between jump marker and ENDLABEL

Program code	Comment
N10 G1 F300 Z-10	
N20 BEGIN1:	
N30 X10	
N40 Y10	
N50 BEGIN2:	
N60 X20	
N70 Y30	
N80 ENDLABEL: Z10	
N90 X0 Y0 Z0	
N100 Z-10	
N110 BEGIN3: X20	
N120 Y30	
N130 REPEAT BEGIN3 P=3	; Execute section from N110 to N120 three times.
N140 REPEAT BEGIN2 P=2	; Execute section from N50 to N80 twice.
N150 M100	
N160 REPEAT BEGIN1 P=2	; Execute section from N20 to N80 twice.
N170 Z10	
N180 X0 Y0	
N190 M30	

Example 5: Milling, machine drill position with different technologies

Program code	Comment
N10 CENTER DRILL()	; Load centering drill.
N20 POS_1:	;Drilling positions 1
N30 X1 Y1	
N40 X2	
N50 Y2	
N60 X3 Y3	
N70 ENDLABEL:	
N80 POS_2:	;Drilling positions 2
N90 X10 Y5	
N100 X9 Y-5	
N110 X3 Y3	

2.11 Repeat program section (REPEAT, REPEATB, ENDLABEL, P)

Program code	Comment
N120 ENDLABEL:	
N130 DRILL()	; Change drill and drilling cycle.
N140 THREAD(6)	; Load tap M6 and threading cycle.
N150 REPEAT POS_1	; Repeat program section once from POS_1 up to ENDLABEL.
N160 DRILL()	; Change drill and drilling cycle.
N170 THREAD(8)	; Load tap M8 and threading cycle.
N180 REPEAT POS_2	; Repeat program section once from POS_2 up to ENDLABEL.
N190 M30	

Further information

- Program section repetitions can be nested. Each call uses a subprogram level.
- If M17 or RET is programmed during processing of a program section repetition, the repetition is canceled. The program is resumed at the block following the REPEAT line.
- In the actual program display, the program section repetition is displayed as a separate subprogram level.
- If the level is canceled during the program section repetition, the program resumes at the point after the program section repetition call.

Example:

Program code	Comments
N5 R10=15	
N10 BEGIN: R10=R10+1	;Width
N20 Z=10-R10	
N30 G1 X=R10 F200	
N40 Y=R10	; Interrupt level
N50 X=-R10	
N60 Y=-R10	
N70 END: Z10	
N80 Z10	
N90 CYCLE(10,20,30)	
N100 REPEAT BEGIN END P=3	
N120 Z10	; Resume program execution.
N130 M30	

- Check structures and program section repetitions can be used in combination. There should be no overlap between the two, however. A program section repetition should appear within a check structure branch or a check structure should appear within a program section repetition.
- If jumps and program section repetitions are mixed, the blocks are executed purely sequentially. For example, if a jump is performed from a program section repetition, processing continues until the programmed end of the program section is found.

Example:

2.11 Repeat program section (REPEAT, REPEATB, ENDLABEL, P)

Program code

```
N10 G1 F300 Z-10
N20 BEGIN1:
N30 X=10
N40 Y=10
N50 GOTOF BEGIN2
N60 ENDLABEL:
N70 BEGIN2:
N80 X20
N90 Y30
N100 ENDLABEL: Z10
N110 X0 Y0 Z0
N120 Z-10
N130 REPEAT BEGIN1 P=2
N140 Z10
N150 X0 Y0
N160 M30
```

Note

The REPEAT statement should appear after the traversing block.

2.12 Check structures

The control processes the NC blocks as standard in the programmed sequence.

This sequence can be variable by programming alternative program blocks and program loops. These check structures are programmed using the key words `IF`, `ELSE`, `ENDIF`, `LOOP`, `FOR`, `WHILE` and `REPEAT`.

NOTICE

Programming error

Check structures may only be inserted in the statement section of a program. Definitions in the program header may not be executed conditionally or repeatedly.

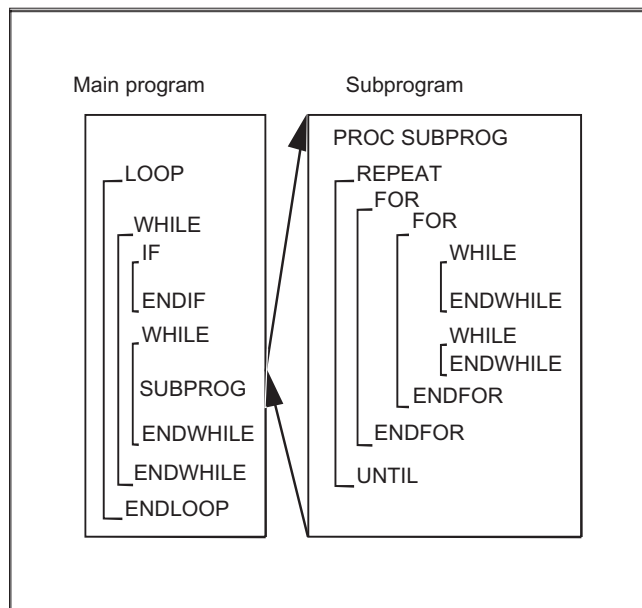

It is not permissible to superimpose macros on keywords for check structures or on jump targets. No such check is made when the macro is defined.

Effectiveness

The check structure cannot be used program-wide.

Nesting depth

A nesting depth of up to 16 check structures can be set up on each subprogram level.

Runtime response

In interpreter mode (active as standard), it is possible to shorten program processing times more effectively by using program branches than can be obtained with check structures.

There is no difference between program branches and check structures in precompiled cycles.

Current block display for program loops

If only selected blocks are executed within a program loop, the last main run block **before** the program loop is shown in the current block display.

So that the processed selected blocks are also visible in the current block display, e.g. for diagnostic purposes, the decoding single block SBL2 must be activated.

References

Function Manual, Basic Functions, Section: Mode group, channel, program operation, reset response (K1) > Single block > Decoding single block SBL2 with implicit preprocessing stop

Grinding without main run block

If, within a program loop, no main run block has been programmed, then the loop is pre-processed until the loop condition is satisfied.

As a consequence, a high level of utilization can occur and this can have a negative impact on the display.

The STOPRE command or a dwell time G04 of 0 seconds can be inserted **in** the loop as countermeasure.

Supplementary conditions

- Blocks with check structure elements cannot be suppressed.
- Jumper markers (labels) are not permitted in blocks with check structure elements.
- Check structures are processed interpretively. When a loop end is detected, a search is made for the loop beginning, allowing for the check structures found in the process. For this reason, the block structure of a program is not checked completely in interpreter mode.
- It is not generally advisable to use a mixture of check structures and program branches.
- A check can be made to ensure that check structures are nested correctly when cycles are preprocessed.

2.12.1 Conditional statement and branch (IF, ELSE, ENDIF)

Conditional statement: IF - program block - ENDIF

With a conditional statement, the program block between `IF` and `ENDIF` is only executed when the condition is satisfied.

Branch: IF - program block_1 - ELSE - program block_2 - ENDIF

With a branch, one of two program blocks is always executed.

If the condition is satisfied, program block_1 between `IF` and `ELSE` is executed.

If the condition is **not** satisfied, program block_2 between `ELSE` and `ENDIF` is executed.

Syntax

Conditional statement

```
IF <condition>
  Program block                               ; Execution when: <condition> == TRUE
ENDIF
```

Branch

```
IF <condition>
  Program block_1                             ; Execution when: <condition> == TRUE
ELSE
  Program block_2                             ; Execution when: <condition> == FALSE
ENDIF
```

Meaning

IF:	Introduces the conditional statement or branch.
ELSE:	Introduces the alternative program block.
ENDIF:	Marks the end of the conditional statement or branch.
<condition>:	Logical expression that is evaluated as TRUE or FALSE.

Example: Tool change subprogram

Program code	Comment
PROC L6	Tool change routine
N500 DEF INT TNR_AKTUELL	Variable for active T number
N510 DEF INT TNR_VORWAHL	Variable for preselected T number
	Determine current tool
N520 STOPRE	
N530 IF \$P_ISTEST	In the program test mode ...
N540 TNR_AKTUELL = \$P_TOOLNO	... The "current" tool is read from the program context.
N550 ELSE	Otherwise ...
N560 TNR_AKTUELL = \$TC_MPP6[9998,1]	... The tool of the spindle is read-out.
N570 ENDIF	
N580 GETSELT(TNR_VORWAHL)	Read the T number of the pre-selected tool in the spindle.
N590 IF TNR_AKTUELL <> TNR_VORWAHL	If the pre-selected tool is still not the current tool, then ...
N600 G0 G40 G60 G90 SUPA X450 Y300 Z300 D0	... Approach tool change position ...
N610 M206	... and execute a tool change.
N620 ENDIF	

Program code	Comment
N630 M17	

2.12.2 Continuous program loop (LOOP, ENDLOOP)

Endless loops are used in endless programs. At the end of the loop, there is always a branch back to the beginning.

Syntax

```

LOOP
...
ENDLOOP

```

Meaning

LOOP:	Initiates the endless loop.
ENDLOOP:	Marks the end of the loop and results in a return jump to the beginning of the loop.

Example

```

Program code
...
LOOP
MSG ("no tool cutting edge active")
M0
STOPRE
ENDLOOP
...

```

2.12.3 Count loop (FOR ... TO ..., ENDFOR)

The count loop is used if an operation must be repeated with a fixed number of runs.

Syntax

```

FOR <variable> = <initial value> TO <end value>
...
ENDFOR

```

Meaning

FOR:	Initiates the count loop.	
ENDFOR:	Marks the end of the loop and results in a return jump to the beginning of the loop, as long as the end value of the count has still not been reached.	
<variable>:	Count variable, which is incremented from the initial to the end value and is increased by the value "1" at each run.	
	Type	INT or REAL Note: The REAL type is used if R parameters are programmed for a count loop, for example. If the count variable is of the REAL type, its value is rounded to an integer.
<initial value>:	Initial value of the count Condition: The start value must be lower than the end value.	
<full-scale value>:	End value of the count	

Examples

Example 1: INTEGER variable or R parameter as count variable

INTEGER variable as count variable:

Program code	Comment
DEF INT iVARIABLE1	
R10=R12-R20*R1 R11=6	
FOR iVARIABLE1 = R10 TO R11	; Count variable = INTEGER variable
R20=R21*R22+R33	
ENDFOR	
M30	

R parameter as count variable:

Program code	Comment
R11=6	
FOR R10=R12-R20*R1 TO R11	; Count variable = R parameter (real variable)
R20=R21*R22+R33	
ENDFOR	
M30	

Example 2: Production of a fixed quantity of parts

Program code	Comment
DEF INT WKPCCOUNT	; Defines type INT variable with the name "WKPCCOUNT".

Program code	Comment
FOR WKPCCOUNT = 0 TO 100	; Initiates the count loop. The "WKPCCOUNT" variable increments from the initial value "0" to the end value "100".
G01 ...	
ENDFOR	; End of count loop
M30	

2.12.4 Program loop with condition at start of loop (WHILE, ENDWHILE)

For a WHILE loop, the condition is at the beginning of the loop. The WHILE loop is executed as long as the condition is fulfilled.

Syntax

```
WHILE <condition>
...
ENDWHILE
```

Meaning

WHILE:	Initiates the program loop.
ENDWHILE:	Marks the end of the loop and results in a return jump to the beginning of the loop.
<condition>:	The condition must be fulfilled so that the WHILE loop is executed.

Example

Program code	Comment
...	
WHILE \$AA_IW[DRILL_AXIS] > -10	; Call the WHILE loop under the following condition: The actual WCS setpoint for the drilling axis must be greater than -10.
G1 G91 F250 AX[DRILL_AXIS] = -1	
ENDWHILE	
...	

2.12.5 Program loop with condition at the end of the loop (REPEAT, UNTIL)

For a REPEAT loop, the condition is at the end of the loop. The REPEAT loop is executed once and repeated continuously until the condition is fulfilled.

Syntax

```
REPEAT
...
UNTIL <significance>
```

Meaning

REPEAT:	Initiates the program loop.
UNTIL:	Marks the end of the loop and results in a return jump to the beginning of the loop.
<condition>:	The condition that must be fulfilled so that the REPEAT loop is no longer executed.

Example

Program code	Comment
...	
REPEAT	; Call the REPEAT loop.
...	
UNTIL ...	; Check whether the condition is fulfilled.
...	

2.12.6 Program example with nested check structures

Program code	Comment
LOOP	
IF NOT \$P_SEARCH	; IF no block search
G1 G90 X0 Z10 F1000	
WHILE \$AA_IM[X] <= 100	; WHILE (setpoint X axis <= 100)
G1 G91 X10 F500	; Drilling pattern
Z-5 F100	
Z5	
ENDWHILE	
ELSE	; ELSE block search
MSG("No drilling during block search")	
ENDIF	; ENDIF
\$A_OUT[1] = 1	; Next drilling plate
G4 F2	
ENDLOOP	
M30	

2.13 Coordination commands (INIT, START, WAITM, WAITMC, WAITE, SETM, CLEARM)

In principle, a channel of the NC can execute the program started in it independently of other channels in its mode group. If, however, several programs in several channels of the mode group are involved in machining a workpiece, the program sequences in the different channels must be coordinated with the following coordination commands.

Requirement

All of the channels involved in the program coordination must belong to the **same** mode group:

MD10010 \$MC_ASSIGN_CHAN_TO_MODE_GROUP[<Channel>] = <Mode group number>

Channel name instead of channel number

Instead of the channel numbers, the channel names entered in MD20000

\$MC_CHAN_NAME[<Channel index>] can also be used as parameters of the predefined procedures for the program coordination. Use of the channel names in the NC programs must be enabled first:

MD10280 \$MN_PROG_FUNCTION_MASK, bit 1 = TRUE

Syntax

```
INIT(<ChanNr>, <Prog>, <AckMode>)
START(<ChanNr>, <ChanNr>, ...)
WAITM(<MarkNr>, <ChanNr>, <ChanNr>, ...)
WAITE(<ChanNr>, <ChanNr>, ...)
WAITMC(<MarkNr>, <ChanNr>, <ChanNr>, ...)
SETM(<MarkNr>, <MarkNr>, ...)
CLEARM(<MarkNr>, <MarkNr>, ...)
```

Meaning

INIT():	Predefined procedure for selecting the NC program that is to be executed in the specified channel
START():	Predefined procedure for starting the program selected in the respective channel
WAITM():	Predefined procedure to wait for a wait marker to be reached in the specified channels The specified wait marker is set by WAITM in the same channel. The previous block is terminated with exact stop. The wait marker is deleted after synchronization. Ten markers can be set per channel simultaneously.
WAITE():	Predefined procedure to wait for the end of program in one or more other channels
WAITMC(): ¹⁾	Predefined procedure to wait for a wait marker to be reached in the specified channels In contrast to WAITM, the braking of the axes on exact stop is only initiated if the other channels have not yet reached the wait marker.
SETM(): ¹⁾	Predefined procedure to set one or more wait markers for the channel coordination The execution in the own channel is not affected by this. SETM remains valid after a channel reset and NC start.

2.13 Coordination commands (INIT, START, WAITM, WAITMC, WAITE, SETM, CLEARM)

CLEARM(): ¹⁾	Predefined procedure to delete one or more wait markers for the channel coordination The execution in the own channel is not affected by this. CLEARM() deletes all wait markers in the channel. CLEARM(0) only deletes wait marker "0". CLEARM remains valid after a channel reset and NC start.		
<ChanNr>:	Channel number The number of the own channel does not have to be specified.		
	Type:	INT	
<Prog>:	Absolute or relative path specification (optional) + program name		
	Type:	STRING	
	For the path specification, see: References Programming Manual, Work Planning, Section "File and Program Administration" > "Program memory" > "Addressing the files of the program memory" (Page 217)		
<AckMode>:	Acknowledgment mode (optional)		
	Type:	CHAR	
	Val- ues:	"N"	Without acknowledgment The program execution is continued after the command has been sent. The sender is not informed if the command cannot be executed successfully.
		"S"	Synchronous acknowledgment The program execution is stopped until the receiving component has acknowledged the command. If the acknowledgment is positive, the next command is executed. If the acknowledgment is negative, an error message is output.
<MarkNr>:	Number of the wait marker Note In a multi-channel system, a maximum of 100 wait markers are available (wait markers 0 ... 99). Only wait marker 0 is available in a single-channel system.		

1) For user-specific communication and/or coordination of channels, wait markers can be deployed using SETM/CLEARM - also without using the conditional wait command WAITMC. The wait marks keep their value - also after a channel reset and NC start.

Examples

START using channel names from MD20000

• Parameterization

```
MD10280 $MN_PROG_FUNCTION_MASK, bit 1 = TRUE
$MC_CHAN_NAME[ 0 ] = "MACHINING" ; Name of channel 1
$MC_CHAN_NAME[ 1 ] = "INFEED" ; Name of channel 2
```

• Programming

Program code	Comment
START(MACHINING)	; Start of channel 1
START(INFEED)	; Start of channel 2

START using local "channel names" and user variables

Program code	Comment
DEF INT MACHINE = 1	; Definition of user variable for channel 1
DEF INT LOADER = 2	; Definition of user variable for channel 2
...	
START(MACHINE)	; Start of channel 1
START(LOADER)	; Start of channel 2

START using local "channel names", user variables and parameterized channel names

Program code	Comment
DEF INT chanNo1	; Definition of user variable for channel 1
DEF INT chanNo2	; Definition of user variable for channel 2
chanNo1 = CHAN_1	; Assignment of parameterized channel name channel 1
chanNo2 = CHAN_2	; Assignment of parameterized channel name channel 2
...	
START(chanNo1)	; Start of channel 1
START(chanNo2)	; Start of channel 2

INIT command with absolute path specification

Selection of program /_N_MPF_DIR/_N_ABSPAN1_MPF in channel 2.

Program code

```
INIT(2, "/_N_WCS_DIR/_N_SHAFT1_WPD/_N_CUT1_MPF")
```

INIT command with program name

Selection of the program with the name "MYPROG". The control searches for the program using the search path.

Program code

```
INIT(2, "MYPROG")
```

2.13 Coordination commands (INIT, START, WAITM, WAITMC, WAITE, SETM, CLEARM)

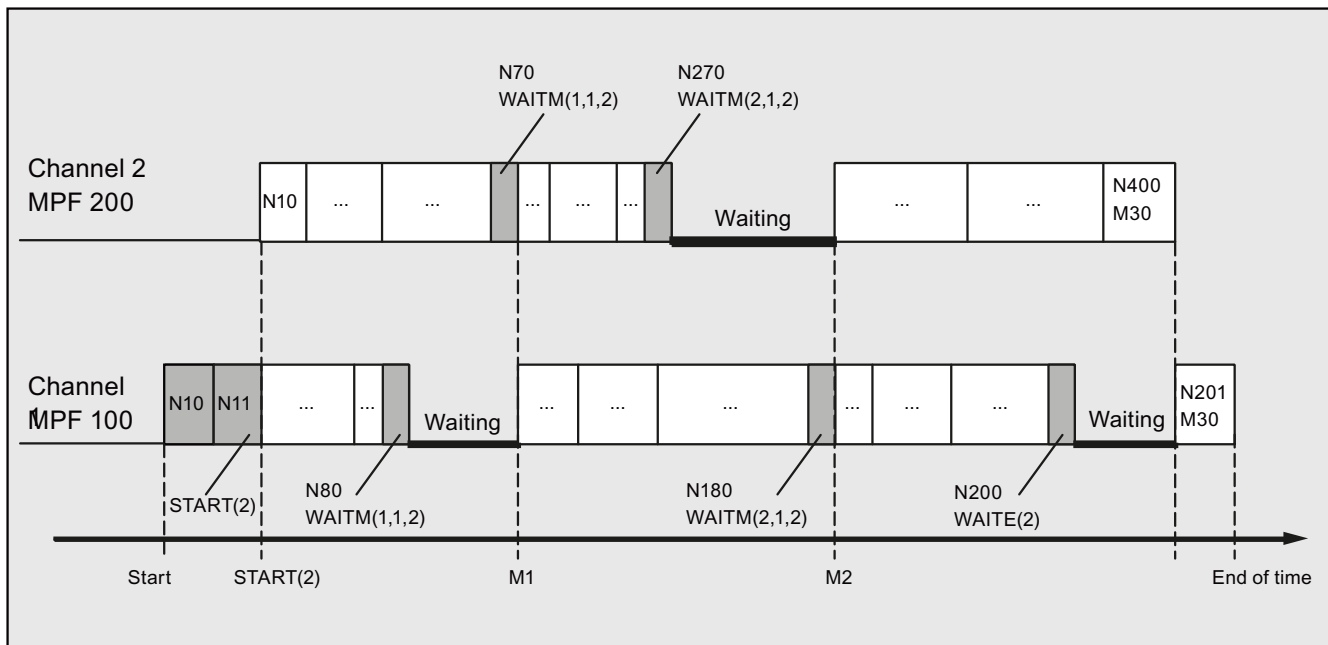

Program coordination with WAITM

- Channel 1: The program /_N_MPF_DIR/_N_MPF100_MPF has already been selected and started.

Program code	Comment
	; Program MPF100
N10 INIT(2,"MPF200","N")	; Selection of program MPF200, channel 2
N11 START(2)	; Start of channel 2
...	
N80 WAITM(1,1,2)	; Wait for WAIT marker 1 in channels 1 and 2
N81 ...	; Channel 1, N81 and channel 2, N71 are ; started synchronously
...	
N180 WAITM(2,1,2)	; Wait for WAIT marker 2 in channels 1 and 2
N181 ...	; Channel 1, N181 and channel 2, N271 are ; started synchronously
...	
N200 WAITE(2)	; Wait for end of program in channel 2
N201 ...	; N201 is only started after the end of program ; MPF200 in channel 2
N201 M30	; End of program channel 1

- Channel 2: In channel 1, the program MPF200_MPF is selected and started for channel 2 using blocks N10 and N20.

Program code	Comment
;\$PATH=/_N_MPF_DIR	; Program MPF200
...	
N70 WAITM(1,1,2)	Wait for WAIT marker 1 in channels 1 and 2
N71 ...	; Channel 1, N81 and channel 2, N71 are ; started synchronously
...	
N270 WAITM(2,1,2)	Wait for WAIT marker 2 in channels 1 and 2
N271 ...	; Channel 1, N181 and channel 2, N271 are ; started synchronously
...	
N400 M30	End of program channel 2

Supplementary conditions

Non-synchronous start of execution of following blocks after WAIT markers

In the case of channel coordination using WAIT markers, a non-synchronous start when executing the following blocks can occur. This behavior occurs if an action is triggered in one of the channels immediately before reaching the common WAIT marker; the consequence of which is implicit repositioning (REPOSA) in this delete distance-to-go.

Assumption: Current axis assignment in channels 1 and 2

- Channel 1: Axes X1 and U
- Channel 2: Axis X2

Table 2-2 Time sequence in channels 1 and 2

Channel 1	Channel 2	Description
...	...	Arbitrary processing in channels 1 and 2
N100 WAITM(20,1,2)		Channel 1: Reaches the WAIT marker and waits for synchronization with channel 2
<i>Start of the GETD(U) processing:</i> <ul style="list-style-type: none"> • Axis exchange • Delete distance-to-go • REPOSA <i>End</i>	N200 GETD(U)	Channel 2: Requests axis U from channel 1 Channel 1: Processing of GET(U) in the background
	N210 WAITM(20,1,2)	Channel 2: Reaches the WAIT mark. ⇒ This completes the synchronization of channels 1 and 2
	N220 G0 X2=100	Channel 2: Start of processing of N220
N110 G0 X1=100		Channel 1: Staggered start of processing of N110

2.14 Interrupt routine (ASUB)

2.14.1 Function of an interrupt routine

Note

The terms "asynchronous subprogram (ASUB)" and "interrupt routine" are used interchangeably in the description below to refer to the same functionality.

A typical example should clarify the function of an interrupt routine:

The tool breaks during machining. This triggers a signal that stops the current machining process and simultaneously starts a subprogram – the so-called interrupt routine. The interrupt routine contains all the statements which are to be executed in this case.

When the interrupt routine execution has finished and the machine is ready to continue operation, the control jumps back to the main program and continues machining at the point of interruption – depending on the `REPOS` command (see "Repositioning at contour (Page 529)").

CAUTION

Risk of collision

If a `REPOS` command has not been programmed in the subprogram, then the control goes to the end point of the block that follows the interrupted block.

References

Function Manual, Basic Functions; Mode Group, Channel, Program Operation, Reset Response (K1), Section: "Asynchronous subprograms (ASUBs), interrupt routines"

2.14.2 Creating an interrupt routine**Create interrupt routine as subprogram**

The interrupt routine is identified as a subprogram in the definition.

Example:

Program code	Comment
PROC LIFT_Z	; Program name "ABHEB_Z"
N10 ...	; The NC blocks then follow:
...	
N50 M17	; Finally, end the program and return to the main program.

Saving modal G commands (SAVE)

The interrupt routine can be designated by defining with `SAVE`.

The `SAVE` attribute means that the active modal G commands are saved before calling the interrupt routine and are reactivated after the end of the interrupt routine (see "Subprograms with `SAVE` mechanism (`SAVE`) (Page 166)").

This means that it is possible to resume processing at the interruption point after the interrupt routine has been completed.

Example:

Program code
PROC LIFT_Z SAVE
N10 ...
...
N50 M17

Assign additional interrupt routines (SETINT)

`SETINT` statements can be programmed within the interrupt routine (see "Assign and start interrupt routine (`SETINT`)" (Page 127)) therefore activating additional interrupt routines. They are triggered via the input.

References

You will find more information on how to create subprograms in Section "Subprograms, Macros".

2.14.3 Assign and start interrupt routine (SETINT, PRIO, BLSYNC)

The control has several fast inputs (inputs 1 ... 8), which initiate an interrupt (1 ... 8). Each interrupt can be assigned a priority and an interrupt routine using the `SETINT` command. If the interrupt is initiated by setting the fast input, then processing in the channel is interrupted and the interrupt routine started.

Interrupt priority

If, in a part program, several inputs are assigned interrupts, then the interrupts must be assigned different priorities.

An interrupt can be assigned a priority value from 1 ... 128. Priority value 1 corresponds to the highest priority and 128 the lowest.

Syntax

```
SETINT (<n>) <NAME>
SETINT (<n>) PRIO=<value> <NAME>
SETINT (<n>) PRIO=<value> <NAME> BLSYNC
SETINT (<n>) PRIO=<value> <NAME> LIFTFAST
```

Meaning

SETINT (<n>):	Input <n> is assigned the interrupt routine <Name>. The assigned interrupt routine is started as soon as input <n> == 1 is detected. Note: If an already programmed input <n> is assigned another interrupt routine, then the previous assignment is no longer effective.	
<n>:	Input number	
	Type:	INT
	Range of values:	1 ... 8
PRIO= :	Priority of the interrupt (optional)	
<value>:	Priority value (optional)	
	Type:	INT
	Range of values:	1 ... 128 (1 ⇒ highest priority)
<NAME>:	Name of the interrupt routine (subprogram)	
BLSYNC:	BLSYNC ensures that after initiating the interrupt, the system first waits until the actual block has been completed. Only then is the interrupt routine executed. (optional)	
LIFTFAST:	LIFTFAST ensures that after initiating the interrupt, initially a fast retraction is realized (see Chapter "Fast retraction from the contour (SETINT LIFTFAST, ALF) (Page 130)"). Only then is the interrupt routine executed. (optional)	

Supplementary conditions

Interrupt rules

1. For every interrupt that cannot be immediately executed, or is presently already being processed, an additional interrupt request is saved. All other interrupt requests for this interrupt are lost.
2. If an interrupt is currently being processed and an additional interrupt with higher priority initiated, then this interrupts the lower-priority interrupt. The lower priority interrupt is continued after the higher priority interrupt has been completed. If, while the higher priority interrupt is being processed, additional requests are received for the lower-priority interrupt, then one request is saved. All others are lost.
3. If an interrupt is currently being processed and an additional interrupt with higher priority initiated, then this interrupts the lower-priority interrupt. The higher priority interrupt is processed. If a higher priority interrupt is initiated, the actual interrupt is interrupted and the higher priority interrupt processed. A maximum of six active interrupt levels are possible. One interrupt level presently being processed and five waiting interrupt levels. For each active interrupt level, a maximum of one additional interrupt request is saved. All other interrupt requests are lost. Interrupt requests are also lost if these are requested for additional interrupt levels (interrupt level ≥ 7).

Examples

Example 1: Assign interrupt routines and define the priority

Program code	Comment
...	
N20 SETINT(3) PRIO=1 ABHEB_Z	; IF input 3 == 1 THEN start interrupt routine "ABHEB_Z"
N30 SETINT(2) PRIO=2 ABHEB_X	; IF input 2 == 1 THEN start interrupt routine "ABHEB_X".
...	

The interrupt routines are executed in the sequence of the priority values if the inputs become available simultaneously (are energized simultaneously): First "ABHEB_Z", then "ABHEB_X".

Example 2: Newly assign an interrupt routine

Program code	Comment
...	
N20 SETINT(3) PRIO=2 ABHEB_Z	; IF input 3 == 1 THEN start interrupt routine "ABHEB_Z"
...	
N80 SETINT(3) PRIO=1 ABHEB_X	; IF input 3 == 1 THEN start interrupt routine "ABHEB_X"
...	

2.14.4 Deactivating/reactivating the assignment of an interrupt routine (DISABLE, ENABLE)

A SETINT statement can be deactivated with DISABLE and reactivated with ENABLE without losing the input → interrupt routine assignment.

Syntax

DISABLE (<n>)
ENABLE (<n>)

Meaning

DISABLE (<n>):	Command: Deactivating the interrupt routine assignment of input <n>	
ENABLE (<n>):	Command: Reactivating the interrupt routine assignment of input <n>	
<n>:	Parameter: Number of the interrupt signal	
	Type:	INT
	Range of values:	1 ... 32

Example

Program code	Comment
N20 SETINT(3) PRIO=1 ABHEB_Z	; If input 3 switches, then interrupt
...	; routine "ABHEB_Z" should start.
N90 DISABLE(3)	; The SETINT statement from N20 is deactivated.
...	
N130 ENABLE(3)	; The SETINT statement from N20 is reactivated.
...	

2.14.5 Delete assignment of interrupt routine (CLRINT)

An interrupt signal assignment defined with SETINT for an NC program (ASUP) can be deleted with CLRINT.

Syntax

CLRINT (<n>)

Meaning

CLRINT (<n>):	Command: Delete assignment of the interrupt signal <n> to the NC program (ASUP) defined with SETINT <n>	
<n>:	Parameter: Number of the interrupt signal	
	Type:	INT
	Range of values:	1 ... 32

Example

Program code	Comment
N20 SETINT (3) PRIO=2 ABHEB_Z	
...	
N50 CLRINT (3)	; The assignment between input "3" and interrupt routine "ABHEB_Z" is deleted.

2.14.6 Fast retraction from the contour (SETINT LIFTFAST, ALF)

For a SETINT statement with LIFTFAST, when the input is switched, the tool is moved away from the workpiece contour using fast retraction.

The further sequence is then dependent on whether the SETINT statement includes an interrupt routine in addition to LIFTFAST:

With interrupt routine: **After** the fast retraction, the interrupt routine is executed.

Without interrupt routine: Machining is stopped after fast retraction and an alarm is output.

Syntax

```
SETINT(<n>) PRIO=1 LIFTFAST
SETINT(<n>) PRIO=1 <NAME> LIFTFAST
```

Meaning

SETINT(<n>):	Command: Assign input <n> to an interrupt routine. The assigned interrupt routine starts when input <n> switches.	
<n>:	Parameter: Input number	
	Type:	INT
	Range of values:	1 ... 8
PRIO= :	Defining the priority	
<value>:	Priority value	
	Range of values:	1 ... 128
	Priority 1 corresponds to the highest priority.	
<NAME>:	Name of the subprogram (interrupt routine) that is to be executed.	
LIFTFAST:	Command: Fast retraction from the contour	
ALF=... :	Command: Programmable traverse direction (in motion block) Regarding the possibilities of programming with ALF, refer to the subject "Traversing direction for fast retraction from the contour (Page 132)".	

Supplementary conditions

Behavior for active frame with mirroring

When determining the retraction direction, a check is performed to see whether a frame with mirror is active. In this case, for the retraction direction, right and left are interchanged referred to the tangential direction. The direction components in tool direction are not mirrored. This behavior is activated with the MD setting:

```
MD21202 $MC_LIFTFAST_WITH_MIRROR = TRUE
```

Example

A broken tool should be automatically replaced by a daughter tool. Machining is then continued with the new tool.

Main program:

Main program	Comment
N10 SETINT(1) PRIO=1 W_WECHS LIFTFAST	; When input 1 is switched, the tool is immediately retracted from the contour with fast retraction (code no. 7 for tool radius compensation G41). Then interrupt routine "W_WECHS" is executed.
N20 G0 Z100 G17 T1 ALF=7 D1	
N30 G0 X-5 Y-22 Z2 M3 S300	
N40 Z-7	

Main program	Comment
N50 G41 G1 X16 Y16 F200	
N60 Y35	
N70 X53 Y65	
N90 X71.5 Y16	
N100 X16	
N110 G40 G0 Z100 M30	

Subprogram:

Subprogram	Comment
PROC W_CHANGE SAVE	; Subprogram where the actual operating state is saved
N10 G0 Z100 M5	; Tool changing position, spindle stop
N20 T11 M6 D1 G41	; Change tool
N30 REPOS L RMBBL M3	; Reposition at the contour and return jump into the main program (this is programmed in a block)

2.14.7 Traversing direction for fast retraction from the contour

Retraction movement

The following G commands define the retraction movement plane:

- **LFTXT**
The retraction movement plane is defined by the path tangent and the tool direction (default setting).
- **LFWP**
The plane of the retraction movement is the active working plane selected with G commands G17, G18 or G19. The direction of the retraction movement is not dependent on the path tangent. This allows a fast retraction to be programmed parallel to the axis.
- **LFPOS**
Retraction of the axis declared using POLFMASK/POLFMLIN to the absolute axis position programmed with POLF.
ALF has no influence on the retraction direction for several axes and for several axes in a linear system.
References:
Programming Manual, Fundamentals, Section: "Rapid retraction during thread cutting"

Programmable traversing direction (ALF=...)

The direction is programmed in discrete steps of 45 degrees with ALF in the plane of the retraction movement.

The possible traversing directions are stored in special code numbers on the control and can be called up using these numbers.

Example:

Program code

```
N10 SETINT(2) PRIO=1 ABHEB_Z LIFTFAST  
ALF=7
```

With G41 activated (machining direction to the left of the contour) the tool vertically moves away from the contour.

Reference plane for defining the traversing direction for LFTXT

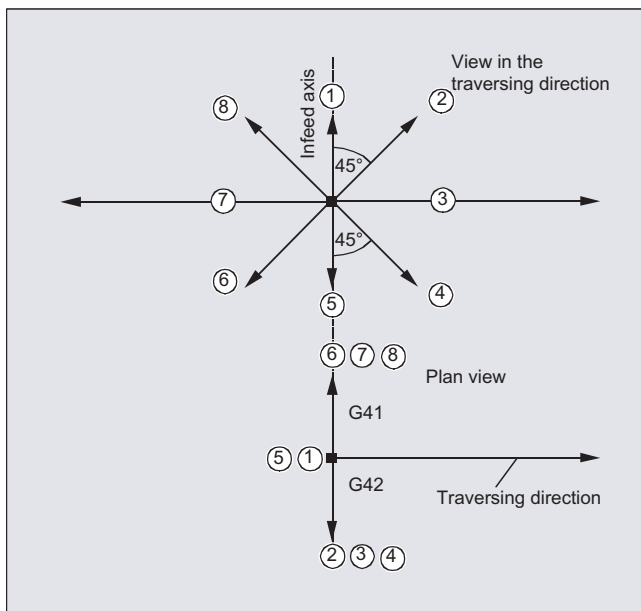

At the point of application of the tool to the programmed contour, the tool is clamped at a plane which is used as a reference for specifying the retraction movement with the corresponding code number.

The reference plane is derived from the longitudinal tool axis (infeed direction) and a vector positioned perpendicular to this axis and perpendicular to the tangent at the point of application of the tool.

Code numbers with traversing direction for LFTXT

Starting from the reference plane, you will find the code numbers with traversing directions in the following diagram.

The retraction in the tool direction is defined for ALF=1.

The "fast retraction" function is deactivated with `ALF=0`.

CAUTION

Risk of collision

When the tool radius compensation is activated, then:

- For G41 codes 2, 3, 4
- For G42 codes 6, 7, 8

should not be used, as in these cases, the tool would move to the contour and would collide with the workpiece.

Code numbers with traversing directions for LFWP

With `LFWP`, the direction in the working plane is derived from the following assignment:

- G17: X/Y plane
 `ALF=1`: Retraction in the X direction
 `ALF=3`: Retraction in the Y direction
- G18: Z/X plane
 `ALF=1`: Retraction in the Z direction
 `ALF=3`: Retraction in the X direction
- G19: Y/Z plane
 `ALF=1`: Retraction in the Y direction
 `ALF=3`: Retraction in the Z direction

2.14.8 Motion sequence for interrupt routines

Interrupt routine without LIFTFAST

Axis motion is braked along the path down to standstill (zero speed). The interrupt routine then starts.

The standstill position is saved as interrupt position and is approached at the end of the interrupt routine for `REPOS` with `RMIBL`.

Interrupt routine with LIFTFAST

Axis motion is braked along the path. The `LIFTFAST` motion is simultaneously executed as superimposed motion. If the path motion and `LIFTFAST` motion have come to a standstill (zero speed), the interrupt routine is started.

The position on the contour is saved as interrupt position where the `LIFTFAST` motion is started and therefore the path was left.

2.14 Interrupt routine (ASUB)

The interrupt routine with `LIFTFAST` and `ALF=0` behaves in precisely the same way as the interrupt routine without `LIFTFAST`.

Note

The absolute value through which the geometry axes move when quickly retracting from the contour can be set using machine data.

2.15 Axis replacement, spindle replacement (RELEASE, GET, GETD)

One or more axes or spindles can only ever be interpolated in one channel. If an axis has to alternate between two different channels (e.g. pallet changer) it must first be enabled in the current channel and then transferred to the other channel. Axis replacement is effective between channels.

Axis replacement extensions

An axis/spindle can be replaced either with a preprocessing stop and synchronization between preprocessing and main run, or without a preprocessing stop. Axis replacement is also possible via:

- Axis container rotation AXCTSWE or AXCTWED using implicit GET/GETD
- Frame with rotation if this process links the axis with other axes.
- Synchronized actions, see Motion-synchronous actions, "Axis replacement RELEASE, GET".

Machine manufacturer

Please refer to the machine manufacturer's instructions. For the purpose of axis replacement, one axis must be defined uniquely in all channels in the configurable machine data and the axis replacement characteristics can also be set using machine data.

Syntax

RELEASE (axis name, axis name, ...) or RELEASE (S1)

GET (axis name, axis name, ...) or GET (S2)

GETD(axis name, axis name, ...) or GETD(S3)

With GETD (GET Directly), an axis is fetched directly from another channel. This means that no suitable RELEASE must be programmed for this GETD in another channel. It also means that other channel communication has to be established (e.g. wait markers).

Meaning

RELEASE (axis name, axis name, etc.):	Release the axis (axes)
GET (axis name, axis name, etc.):	Accept the axis (axes)
GETD (axis name, axis name, etc.):	Directly accept the axis (axes)
Axis name:	Axis assignment in the system: AX1, AX2, ... or specify machine axis name
RELEASE (S1) :	Release spindles S1, S2, ...
GET (S2) :	Accept spindles S1, S2, ...
GETD (S3) :	Direct acceptance of spindles S1, S2, ...

GET request without preprocessing stop

If, following a GET request **without** preprocessing stop, the axis is enabled again with RELEASE (axis) or WAITP (axis), a subsequent GET will induce a GET **with** preprocessing stop.

**CAUTION****Axis assignment changed**

An axis or spindle accepted with GET remains assigned to this channel even after a key or program RESET.

When a program is restarted the replaced axes or spindles must be reassigned in the program if the axis is required in its original channel.

It is assigned to the channel defined in the machine data on POWER ON.

Examples**Example 1: Axis exchange between two channels**

Of the six axes, the following are used for machining in channel 1: 1., 2., 3. 1st, 2nd, 3rd and 4th axis.

The 5th and 6th axes in channel 2 are used for the workpiece change.

Axis 2 should be exchanged between two channels and after POWER ON can be assigned to channel 1.

Program "MAIN" in channel 1:

Program code	Comment
INIT (2,"TRANSFER2")	; Select program TRANSFER2 in channel 2.
N... START (2)	; Start the program in channel 2.
N... GET (AX2)	; Accept axis AX2.
...	
N... RELEASE (AX2)	; Release axis AX2.
N... WAITM (1,1,2)	; Wait for WAIT marker in channel 1 and 2 for synchronizing in both channels.
...	; Rest of program after axis replacement.
N... M30	

Program "TRANSFER2" in channel 2:

Programming	Comment
N... RELEASE (AX2)	
N160 WAITM(1,1,2)	; Wait for WAIT marker in channel 1 and 2 for synchronizing in both channels.
N150 GET(AX2)	; Accept axis AX2.
...	; Rest of program after axis replacement.
N... M30	

Example 2: Axis exchange without synchronization

If the axis does not have to be synchronized no preprocessing stop is generated by GET.

Programming	Comment
N01 G0 X0	
N02 RELEASE (AX5)	
N03 G64 X10	
N04 X20	
N05 GET (AX5)	; If synchronization is not required, then this is not a block that can be executed.
N06 G01 F5000	; Block that cannot be executed.
N07 X20	; Block that cannot be executed, because X position as in N04.
N08 X30	; First block that can be executed after N05.
...	

Example 3: Activating an axis exchange without a preprocessing stop

Requirement: Axis replacement without a preprocessing stop must be configured via machine data.

Programming	Comment
N010 M4 S100	
N011 G4 F2	
N020 M5	
N021 SPOS=0	
N022 POS[B]=1	
N023 WAITP(B)	; Axis B becomes the neutral axis.
N030 X1 F10	
N031 X100 F500	
N032 X200	
N040 M3 S500	; Axis does not trigger a preprocessing stop / REORG
N041 G4 F2	
N050 M5	
N099 M30	

If the spindle or axis B is traversed, e.g. to 180 degrees and then back to 1 degree immediately after block N023 as the **PLC axis**, this axis will revert to its neutral status and will not trigger a preprocessing stop in block N40.

Further information**Requirements for axis replacement**

- The axis must be defined in all channels that use the axis in the machine data.
- It is necessary to define to which channel the axis will be assigned after POWER ON in the **axis-specific** machine data.

Description

Release axis: RELEASE

When enabling the axis please note:

1. The axis must not be involved in a transformation.
2. All the axes involved in an axis link (tangential control) must be enabled.
3. A concurrent positioning axis cannot be replaced in this situation.
4. All the following axes of a gantry master axis are transferred with the master.
5. With coupled axes (coupled motion, master value coupling, electronic gear) only the leading axis of the group can be enabled.

Accept axis: GET

The actual axis replacement is performed with this command. The channel for which the command is programmed takes full responsibility for the axis.

Effects of GET:

Axis replacement with synchronization:

An axis always has to be synchronized if it has been assigned to another channel or the PLC in the meantime and has not been resynchronized with "WAITP", G74 or delete distance-to-go before GET.

- A preprocessing stop follows (as for STOPRE).
- Execution is interrupted until the replacement has been completed.

Automatic "GET"

If an axis is in principle available in a channel but is not currently defined as a "channel axis", GET is executed automatically. If the axis/axes is/are already synchronized no preprocessing stop is generated.

Varying the axis replacement behavior

The transfer point of axes can be set as follows using machine data:

- Automatic axis replacement between two channels then also takes place when the axis has been brought to a neutral state by WAITP (response as before)
- When requesting an axis container rotation, all axes of the axis container which can be assigned to the executing channel are brought into the channel using implicit GET or GETD. A subsequent axle replacement is only permitted again once the axis container rotation has been completed.

2.15 Axis replacement, spindle replacement (RELEASE, GET, GETD)

- When an intermediate block is inserted in the main run, a check will be made to determine whether or not reorganization is required. Reorganization is only necessary if the axis states of this block do **not** match the current axis states.
- Instead of a GET block with preprocessing stop and synchronization between preprocessing and main run, axes can be replaced without a preprocessing stop. In this case, an intermediate block is simply generated with the GET request. In the main run, when this block is executed, the system checks whether the states of the axes in the block match the current axis states.

For more information about how axis or spindle replacement works, see
Function Manual, Extended Functions, Mode Groups, Channels, Axis Replacement (K5).

2.16 Transfer axis to another channel (AXTOCHAN)

The AXTOCHAN language command can be used to request an axis in order to move it to a different channel. The axis can be moved to the corresponding channel both from the NC part program and from a synchronized action.

Syntax

```
AXTOCHAN(axis name,channel number[,axis name,channel number[,...]])
```

Meaning

Element	Description
AXTOCHAN:	Request axis for a specific channel
Axis name:	Axis assignment in the system: X, Y, ... or entry of machine axis names concerned. The executing channel does not have to be the same channel or even the channel currently in possession of the interpolation right for the axis.
Channel number:	Name of the channel to which the axis is to be assigned

Note

Competing positioning axis and PLC controlled axis exclusively

A PLC axis cannot replace the channel as a competing positioning axis. An axis controlled exclusively by the PLC cannot be assigned to the NC program.

References:

Function Manual, Extended Functions; Positioning Axes (P2)

Example

AXTOCHAN in the NC program

Axes X and Y have been declared in the first and second channels. Currently, channel 1 has the interpolation right and the following program is started in that channel.

Program code	Comment
N110 AXTOCHAN(Y,2)	;Move Y axis to the second channel
N111 M0	
N120 AXTOCHAN(Y,1)	; Retrieve Y axis (neutral).
N121 M0	
N130 AXTOCHAN(Y,2,X,2)	;Move Y axis and X axis to the second channel (axes are neutral).
N131 M0	
N140 AXTOCHAN(Y,2)	; Move Y axis to the second channel (NC program).
N141 M0	

Further information

AXTOCHAN in the NC program

A `GET` is only executed in the event of the axis being requested for the NC program in the same channel (this means that the system waits for the state to actually change). If the axis is requested for another channel or is to become the neutral axis in the same channel, the request is sent accordingly.

AXTOCHAN from a synchronized action

In the event of an axis being requested for the same channel, `AXTOCHAN` from a synchronized action is mapped to a `GET` from a synchronized action. In this case, the axis becomes the neutral axis on the first request for the same channel. On the second request, the axis is assigned to the NC program in the same way as the `GET` request in the NC program. For more information about `GET` requests from a synchronized action, see "Motion-synchronous actions".

2.17 Activate machine data (NEWCONF)

The `NEWCONF` command activates all machine data. The function can also be activated in the HMI user interface by pressing the "MD data effective" softkey.

When the "NEWCONF" function is executed there is an implicit preprocessing stop; in other words, path movement is interrupted.

Syntax

`NEWCONF`

Meaning

<code>NEWCONF:</code>	Command for setting all machine data of the "NEW_CONFIG" effectiveness level active
-----------------------	---

Cross-channel execution of NEWCONF from the part program

If changes are made to axial machine data from the part program and then activated with `NEWCONF`, `NEWCONF` will only activate the machine data containing changes affecting the part program channel.

Note

In order to ensure that all changes are applied, the `NEWCONF` command must be executed in every channel in which the axes or functions affected by the changes to the machine data is being calculated.

No axial machine data is effective for `NEWCONF`.

An axial RESET must be performed for axes controlled by the PLC.

Example

Milling: Machine drill position with different technologies

Program code	Comment
N10 \$MA_CONTOUR_TOL[AX]=1.0	; Change machine data.
N20 NEWCONF	; Activate machine data.
...	

2.18 Write file (WRITE)

The `WRITE` command writes sets/data from the NC program at the end of a file (log file) in the passive file system or to external program memory. This can also be the program that is presently being executed.

Note

If no such file exists in the program memory, one will be created and can be written to using the `WRITE` command.

Requirement

The currently set protection level must be equal to or greater than the `WRITE` right of the file. If this is not the case, access is denied with an error message (return value of error variable = 13).

Syntax

```
DEF INT <error>
...
WRITE(<error>,"<file name>"/"<ExtG>","<set/data>")
```

Meaning

WRITE:	Command for appending a block or data to the end of the specified file.		
<error>:	Parameter 1: Variable for returning the error value		
	Type:	INT	
	Value:	0	No error
		1	Path not permitted
		2	Path not found
		3	File not found
		4	Incorrect file type
		10	File is full
		11	The file is in use
		12	No resources available
		13	No access rights
		14	Missing or unsuccessful EXTOPEN for the output device
		15	Error when writing to an external device
		16	Invalid external path has been programmed

<file name>:	Parameter 2: The name of the file in which the specified block or specified data is to be added.	
	Type:	STRING
	The absolute path can be specified before the actual file name. If a path is not specified, the file is searched for in the current directory (= directory of selected program). Rules regarding path data, see "Addressing program memory files (Page 217)".	
<ExtG>:	If the data is to be output to an external device/file using the "Process DataShare" function, then the symbolic identifiers for the external device/file to be opened must be specified instead of the file name.	
	Type:	STRING
	For further information, see "Process DataShare - Output to an external device/file (EXTOPEN, WRITE, EXTCLOSE): (Page 659)". Note: The identifier must be identical to the identifier specified in the EXTOPEN command.	
<block/data>:	Parameter 3: The block or data to be added to the specified file.	
	Type:	STRING

Note

When writing to the passive file system or to an external program memory, the WRITE command implicitly inserts an "LF" character (LINE FEED = new line) at the end of the output string.

This behavior does not apply for output to an external device/file using the "Process DataShare" function. If an "LF" is also to be output, then this must be explicitly specified in the output string.

→ also refer to example 3: Implicit/explicit "LF"!

Supplementary conditions

- **Maximum file size (→ machine manufacturer)**
The maximum possible file size of log files in the passive file system is set with the machine data:
MD11420 \$MN_LEN_PROTOCOL_FILE
The maximum file length is applicable for all files created using the WRITE command in the passive file system. If it is exceeded, an error message is output and the block or data is not saved. If there is sufficient free memory, a new file can be created.

Examples**Example 1: WRITE command into the passive file system without absolute path data**

Program code	Comment
N10 DEF INT ERROR	; Definition of error variables.
N20 WRITE(ERROR,"PROT","LOG FROM 7.2.97")	; Write the text "LOG FROM 7.2.97" to file _N_PROT_MPF.
N30 IF ERROR	;Error evaluation.

Program code	Comment
N40 MSG ("Error with WRITE command:" <<ERROR)	
N50 M0	
N60 ENDIF	
...	

Example 2: WRITE command into the passive file system with absolute path data

Program code
...
WRITE(ERROR, "/_N_WKS_DIR/_N_PROT_WPD/_N_PROT_MPF", "LOG FROM 7.2.97")
...

Example 3: Implicit/explicit "LF"**a) Write to the passive file system with implicitly generated "LF"**

Program code
...
N110 DEF INT ERROR
N120 WRITE(ERROR, "/_N_MPF_DIR/_N_MYPROTFILE_MPF", "MY_STRING")
N130 WRITE(ERROR, "/_N_MPF_DIR/_N_MYPROTFILE_MPF", "MY_STRING")
N140 M30

Output result:

MY_STRING

MY_STRING

b) Write to an external file without implicitly generated "LF"

Program code
...
N200 DEF STRING[30] DEV_1
N210 DEF INT ERROR
N220 DEV_1="LOCAL_DRIVE/myprotfile.mpf"
N230 EXTOPEN(ERROR, DEV_1)
N240 WRITE(ERROR, DEV_1, "MY_STRING")
N250 WRITE(ERROR, DEV_1, "MY_STRING")
N260 EXTCLOSE(ERROR, DEV_1)
N270 M30

Output result:

MY_STRINGMY_STRING

c) Write to an external file with explicitly generated "LF"

The following must be programmed in order to achieve the same result as under a:

Program code

```
...  
N200 DEF STRING[30] DEV_1  
N210 DEF INT ERROR  
N220 DEV_1="LOCAL_DRIVE/myprotfile.mpf"  
N230 EXTOPEN(ERROR,DEV_1)  
N240 WRITE(ERROR,DEV_1,"MY_STRING'H0A'")  
N250 WRITE(ERROR,DEV_1,"MY_STRING'H0A'")  
N260 EXTCLOSE(ERROR,DEV_1)  
N270 M30
```

Output result:

MY_STRING

MY_STRING

2.19 Delete file (DELETE)

The `DELETE` command deletes all files, irrespective of whether these were created using the `WRITE` command or not. Files that were created using a higher access authorization can also be deleted with `DELETE`.

Syntax

```
DEF INT <error>
DELETE(<error>,"<file name>")
```

Meaning

DELETE:	Command for deleting the specified file.			
<error>:	Variable for returning the error value.			
	Type:	INT		
	Value:	0	No error	
		1	Path not allowed	
		2	Path not found	
		3	File not found	
		4	Incorrect file type	
		11	The file is in use	
		12	No resources available	
20		Other error		
<file name>:	Name of the file to be deleted			
	Type:	STRING		
	The absolute path can be specified before the actual file name. If a path is not specified, the file is searched for in the current directory (= directory of selected program). Rules regarding path data, see "Addressing program memory files (Page 217)".			

Example

Program code	Comment
N10 DEF INT ERROR	; Definition of error variables.
N15 STOPRE	; Preprocessing stop.
N20 DELETE(ERROR,"/_N_SPF_DIR/_N_TEST1_SPF")	; Deletes file TEST1 in the sub-program directory.
N30 IF ERROR	; Error evaluation.
N40 MSG("error for DELETE command:" <<ERROR)	
N50 M0	
N60 ENDIF	

2.20 Read lines in the file (READ)

The `READ` command reads one or several lines in the specified file and stores the information read in a `STRING` type array. In this array, each read line occupies an array element.

Requirement

The currently set protection level must be equal to or greater than the `READ` right of the file. If this is not the case, access is denied with an error message (return value of error variable = 13).

Syntax

```
DEF INT <error>
DEF STRING[<string length>] <result>[<n>,<m>]
READ(<error>,"<file name>",<start line>,<number of lines>,<result>)
```

Meaning

READ:	Command for reading lines from the specified file and storing these lines in a variable array.		
<error>:	Variable for returning the error value (call-by-reference parameter)		
	Type.	INT	
	Value:	0	No error
		1	Path not allowed
		2	Path not found
		3	File not found
		4	Incorrect file type
		11	The file is in use
		13	Insufficient access rights
		21	Line does not exist (<start line> or <number of lines> parameter exceeds the number of lines in the specified file).
		22	Field length of the result variable (<result>) is too small.
23	Line range too large (<number of lines> parameter selected so large that the read would go beyond the end of the file).		
<file name>:	Name of the file to be read (call-by-value parameter)		
	Type:	STRING	
	The absolute path can be specified before the actual file name. If a path is not specified, the file is searched for in the current directory (= directory of selected program). Rules regarding path data, see "Addressing program memory files (Page 217)".		

<start line>:	Start line of the file section to be read (call-by-value parameter)		
	Type:	INT	
	Value:	0	Reads the number of lines specified with the <number of lines> parameter before the end of the file.
		1 to n	Number of the first line to be read.
<number of lines>:	Number of lines to be read (call-by-value parameter)		
	Type:	INT	
<result>:	Result variable (call-by-reference parameter)		
	Variable array in which the read text is stored.		
	Type:	STRING (max. length: 255)	
	If fewer lines are specified in the <number of lines> parameter than the array size [<n>, <m>] of the result variable, the remaining array elements will not be modified.		
	Termination of a line by means of the control characters "LF" (Line Feed) or "CR LF" (Carriage Return Line Feed) is not stored in the result variable. Read lines are cropped if the line is longer than the defined string length. An error message is not output.		

Note

Binary files cannot be read in. The "incorrect data type" error is output (return value of the error variable = 4). The following types of file are not readable: _BIN, _EXE, _OBJ, _LIB, _BOT, _TRC, _ACC, _CYC, _NCK.

Example

Program code	Comment
N10 DEF INT ERROR	; Definition of error variables.
N20 DEF STRING[255] RESULT[5]	; Definition of result variables.
N30 READ(ERROR,"/_N_CST_DIR/_N_TESTFILE_MPF", 1,5,RESULT)	;File name with domain and file identifier and path name.
N40 IF ERROR <>0	;Error evaluation.
N50 MSG ("ERROR"<<ERROR<<"ON READ COMMAND")	
N60 M0	
N70 ENDIF	
...	

2.21 Check for presence of file (ISFILE)

The `ISFILE` command checks whether a file exists in the program memory.

Syntax

```
<Result>=ISFILE("<File name>")
```

Meaning

ISFILE:	Command to check the availability of a file		
<file name>:	Name of the file whose availability is to be checked.		
	Type:	STRING	
	The absolute path can be specified before the actual file name. If a path is not specified, the file is searched for in the current directory (= directory of selected program).		
	Rules regarding path data, see "Addressing program memory files (Page 217)".		
<result>:	Result variable to which the result of the check is assigned.		
	Type:	BOOL	
	Value:	TRUE	File exists
		FALSE	File does not exist

Examples

Example 1

Program code	Comment
N10 DEF BOOL RESULT	; Definition of result variables.
N20 RESULT=ISFILE("TESTFILE")	
N30 IF (RESULT==FALSE)	
N40 MSG("FILE DOES NOT EXIST")	
N50 M0	
N60 ENDIF	
...	

Example 2

Program code	Comment
N10 DEF BOOL RESULT	; Definition of result variables.
N20 RESULT=ISFILE("TESTFILE")	
N30 IF (NOT ISFILE("TESTFILE"))	
N40 MSG("FILE DOES NOT EXIST")	
N50 M0	
N60 ENDIF	
...	

2.22 Read out file information (FILEDATE, FILETIME, FILESIZE, FILESTAT, FILEINFO)

The FILEDATE, FILETIME, FILESIZE, FILESTAT, and FILEINFO commands read out specific file information such as date/time of the last write access, current file size, file status or all of this information.

Requirement

The currently set protection level must be equal to or greater than the show right of the superordinate directory. If this is not the case, access is denied with an error message (return value of error variable = 13).

Syntax

```
FILE....(<Error>,"<File name>",<Result>)
```

Meaning

FILEDATE:	Returns the date of the last write access to a file		
FILETIME:	Returns the time of the last write access to a file		
FILESIZE:	Returns the current size of a file		
FILESTAT:	Returns a file with regard to the following rights for the status : <ul style="list-style-type: none"> • Read (r: read) • Write (w: write) • Execute (x: execute) • Show (s: show) • Delete (d: delete) Note: These protection levels are specific properties of the passive file system. When accessing an external program memory, FILESTAT therefore supplies default access rights (77777).		
FILEINFO:	For a file, supplies the sum of the information , which can be read out via FILEDATE, FILETIME, FILESIZE and FILESTAT		
<Error>:	Variable for returning the error value (call-by-reference parameter)		
	Type.	VAR INT	
	Value:	0	No error
		1	Path not allowed
		2	Path not found
		3	File not found
		4	Incorrect file type
		13	Insufficient access rights
		22	String length of the result variable (<result>) is too small.

<file name>:	Name of the file from which the file information is to be read out			
	Type:	CHAR[160]		
	The absolute path can be specified before the actual file name. If a path is not specified, the file is searched for in the current directory (= directory of selected program).			
	Rules regarding path data, see "Addressing program memory files (Page 217)".			
<result>:	Result variable (Call-By-Reference parameter)			
	Variable in which the requested file information is stored.			
	Type:	VAR CHAR[8]	at	FILEDATE Format: "dd.mm.yy"
		VAR CHAR[8]	at	FILETIME Format: "hh.mm.ss"
		VAR INT	at	FILESIZE The file size is output in bytes.
		VAR CHAR[5]	at	FILESTAT Format: "rwxsd" (r: read, w: write, x: execute, s: show, d: delete)
VAR CHAR[32]		at	FILEINFO Format: "rwxsd nnnnnnnn dd.mm.yy hh:mm:ss"	

Example

Program code	Comment
N10 DEF INT ERROR	; Definition of error variables.
N20 STRING[32] RESULT	; Definition of result variables.
N30 FILEINFO(ERROR, "/_N_MPF_DIR/_N_TESTFILE_MPF", RESULT)	; File name with domain, file ID and path data.
N40 IF ERROR <> 0	; Error evaluation
N50 MSG("ERROR"<<ERROR<<"FOR FILE INFORMATION COMMAND")	
N60 M0	
N70 ENDIF	
...	

In the result variables RESULT, the example could supply the following result:

"77777 12345678 26.05.00 13:51:30"

2.23 Roundup (ROUNDUP)

Input values, type REAL (fractions with decimal point) can be rounded up to the next higher integer number using the ROUNDUP" function.

Syntax

ROUNDUP (<value>)

Meaning

ROUNDUP:	Command to roundup an input value
<value>:	Input value, type REAL

Note

Input value, type INTEGER (an integer number) is returned unchanged.

Examples

Example 1: Various input values and their rounding up results

Example	Rounding up result
ROUNDUP (3.1)	4.0
ROUNDUP (3.6)	4.0
ROUNDUP (-3.1)	-3.0
ROUNDUP (-3.6)	-3.0
ROUNDUP (3.0)	3.0
ROUNDUP (3)	3.0

Example 2: ROUNDUP in the NC program

Program code
N10 X=ROUNDUP (3.5) Y=ROUNDUP (R2+2)
N15 R2=ROUNDUP (\$AA_IM[Y])
N20 WHEN X=100 DO Y=ROUNDUP (\$AA_IM[X])
...

2.24 Subprogram technique

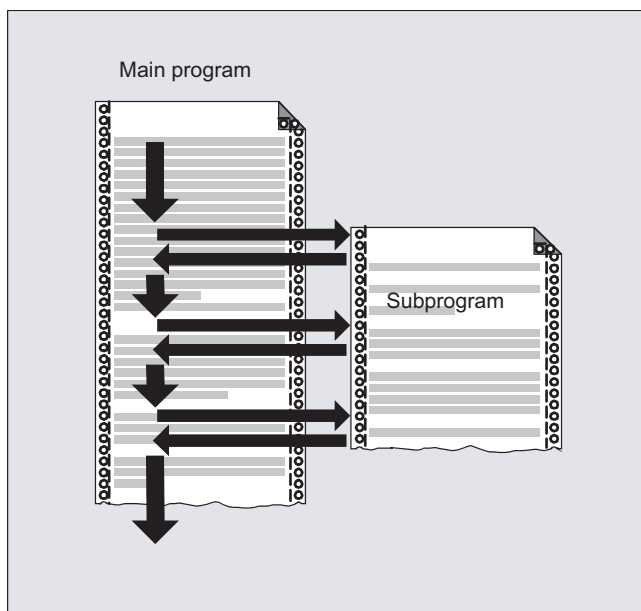

2.24.1 General information

2.24.1.1 Subprogram

The term "subprogram" has its origins during the time when part programs were split strictly into main and subprograms. Main programs were the part programs selected for processing on the control and then launched. Subprograms were the part programs called from within the main program.

This strict division no longer exists with today's SINUMERIK NC language. In principle, each part program can be selected as a main program and launched or called from another part program as a subprogram.

Accordingly, the subprogram can then be used to refer to a part program called from within another part program.

Application

As in all high-level programming languages, in the NC language, subprograms swap out program sections used more than once to independent, self-contained programs.

Subprograms offer the following advantages:

- Increase the transparency and readability of programs
- Increase quality by reusing tested program parts
- Offer the possibility of creating specific machining libraries
- Save memory space

2.24.1.2 Subprogram names

Naming rules

The subprogram name can be chosen freely providing the following rules are observed:

- Permissible characters:
 - Letters: A ... Z, a ... z
 - Numbers: 0 ... 9
 - Underscore: _
- The first two characters should either be two letters or an underscore followed by a letter.

Note

If this condition is satisfied, then an NC program can be called as subprogram from another program just by specifying the program name. However, if the program name starts with digits, the subprogram call is then only possible via the CALL statement.

- Maximum length: 24 characters

Note

Uppercase/lowercase letters

The SINUMERIK NC language does **not** distinguish between uppercase and lowercase letters.

Note

Impermissible program names

To avoid problems with Windows applications, the following program names may **not** be used:

- CON, PRN, AUX, NUL
 - COM1, COM2, COM3, COM4, COM5, COM6, COM7, COM8, COM9
 - LPT1, LPT2, LPT3, LPT4, LPT5, LPT6, LPT7, LPT8, LPT9
-

Control-internal extensions

The program name assigned when the subprogram is created is expanded within the control with the addition of a prefix and a suffix:

- Prefix: `_N_`
- Postfix: `_SPF`

Using the program name

When using the program name, e.g. in the context of a subprogram call, all combinations of prefix, program name, and suffix are possible.

Example:

The subprogram with the program name SUB_PROG can be started using the following identifiers:

1. SUB_PROG
2. _N_SUB_PROG
3. SUB_PROG_SPF
4. _N_SUB_PROG_SPF

Main programs and subprograms with the same name

If a main program (.MPF) and a subprogram (.SPF) exist with the same program name, the appropriate file extension for the unique identification must be specified when the program name in the NC program is used. Otherwise the program found first in the search path with the specified name is used.

2.24.1.3 Nesting of subprograms

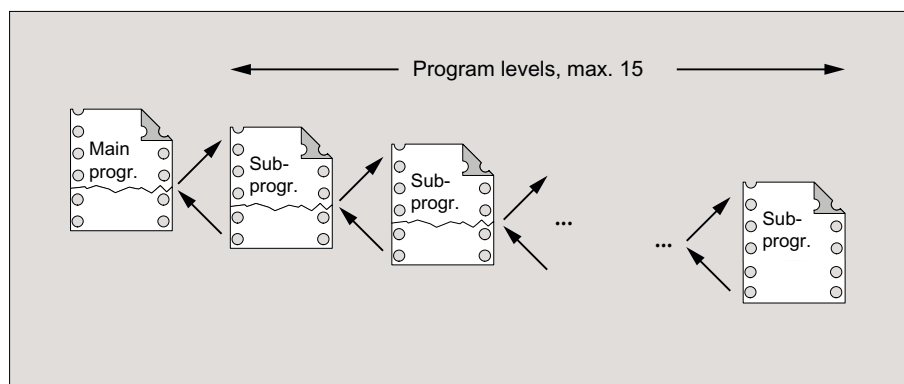

A main program can call subprograms which in turn call more subprograms. As such, the sequences of the programs are nested within each other. Each program runs on a dedicated program level.

Nesting depth

The NC language currently provides 16 program levels. The main program always runs at the uppermost program level, 0. A subprogram always runs at the next lowest program level following the call. Program level 1 is, therefore, the first subprogram level.

Division of program levels:

- Program level 0: Main program level
- Program level 1 to 15: Subprogram level 1 to 15

Interrupt routines (ASUB)

If a subprogram is called in the context of an interrupt routine, this will not be executed at the program level currently active in the channel (n) but at the next lowest program level (n+1). So that this remains possible even at the lowest program level, 2 additional program levels (16 and 17) are available in conjunction with interrupt routines.

If more than 2 program levels are required, this has to be taken into account explicitly in the structuring of the part program executed in the channel. In other words, only a maximum of as many program levels may be used in order to leave sufficient program levels available for interrupt processing.

If interrupt processing needs 4 program levels for example, the part program must be structured so that it uses a maximum of up to program level 13. In the event of an interrupt, the 4 program levels it requires (14 to 17) will be available to it.

Siemens cycles

Siemens cycles need 3 program levels. Therefore, a Siemens cycle must be called at the latest in:

- Part program processing: program level 12
- interrupt routine: program level 14

2.24.1.4 Search path

When a subprogram without path details is called, the control system searches the available program memory using a predefined search sequence (see "Search path for subprogram call (Page 221)").

2.24.1.5 Formal and actual parameters

Formal and actual parameters occur in conjunction with the definition and calling of subprograms with parameter transfer.

Formal parameter

When a subprogram is defined, the parameters to be transferred to it (known as the formal parameters) have to be defined with type and parameter name.

The formal parameters define, therefore, the interface of the subprogram.

Example:

Program code	Comment
PROC CONTOUR (REAL X, REAL Y)	; Formal parameters: X and Y, both REAL type
N20 X1=X Y1=Y	; Traversing of axis X1 to position X and axis Y1 to position Y
...	
N100 RET	

Actual parameters

When a subprogram is called, absolute values or variables (known as actual parameters) have to be transferred to it.

As such, the actual parameters assign up-to-date values to the interface of the subprogram when the latter is called.

Example:

Program code	Comment
N10 DEF REAL WIDTH	; Variable definition
N20 WIDTH=20.0	; Variable assignment
N30 CONTOUR(5.5, WIDTH)	; Subprogram call with actual parameters: 5.5 and WIDTH
...	
N100 M30	

2.24.1.6 Parameter transfer

Definition of a subprogram with parameter transfer

A subprogram with parameter transfer is defined using the `PROC` keyword and a complete list of all the parameters expected by the subprogram.

Incomplete parameter transfer

When the subprogram is called, not all the parameters defined in the subprogram interface have to be transferred explicitly. If a parameter is omitted, the default value "0" is transferred for it.

So that the parameter sequence can be uniquely identified, however, the commas used as parameter separators always have to be included. The last parameter is an exception. If it is omitted from the call, the last comma can also be left out.

Example:

Subprogram:

Program code	Comment
PROC SUB_PROG (REAL X, REAL Y, REAL Z)	; Formal parameters: X, Y, and Z
...	
N100 RET	

Main program:

Program code	Comment
PROC MAIN_PROG	
...	

Program code	Comment
N30 SUB_PROG(1.0,2.0,3.0)	; Subprogram call with complete parameter transfer: X=1.0, Y=2.0, Z=3.0
...	
N100 M30	

Examples for the subprogram call in N30 with incomplete parameter transfer:

N30 SUB_PROG(,2.0,3.0)	; X=0.0, Y=2.0, Z=3.0
N30 SUB_PROG(1.0, ,3.0)	; X=1.0, Y=0.0, Z=3.0
N30 SUB_PROG(1.0,2.0)	; X=1.0, Y=2.0, Z=0.0
N30 SUB_PROG(, ,3.0)	; X=0.0, Y=0.0, Z=3.0
N30 SUB_PROG(, ,)	; X=0.0, Y=0.0, Z=0.0

NOTICE

Call-by-reference parameter transfer

Parameters transferred using call-by-reference must not be left out of the subprogram call.

NOTICE

AXIS data type

AXIS data type parameters must not be left out of the subprogram call.

Checking the transfer parameters

System variable \$P_SUBPAR [n] where n = 1, 2, etc., can be used to check whether a parameter has been transferred explicitly or left out in the subprogram. The index n refers to the sequence of the formal parameters. Index n = 1 refers to the first formal parameter, index n = 2 to the second formal parameter, and so on.

The following program excerpt shows an example of how a check can be performed based on the first formal parameter:

Programming	Comment
PROC SUB_PROG (REAL X, REAL Y, REAL Z)	; Formal parameters: X, Y, and Z
N20 IF \$P_SUBPAR[1]==TRUE	; Check of the first formal parameter X.
...	; These actions are taken if the formal parameter X has been transferred explicitly.
N40 ELSE	
...	; These actions are taken if the formal parameter X has not been transferred.
N60 ENDIF	
...	; General actions
N100 RET	

2.24.2 Definition of a subprogram

2.24.2.1 Subprogram without parameter transfer

When defining subprograms without parameter transfer, the definition line at the beginning of the program can be omitted.

Syntax

```
[PROC <program name>]
...
```

Meaning

PROC:	Definition operation at the beginning of a program
<program name>:	Name of the program

Example

Example 1: Subprogram with PROC operation

Program code	Comment
PROC SUB_PROG	; Definition line
N10 G01 G90 G64 F1000	
N20 X10 Y20	
...	
N100 RET	; Subprogram return

Example 2: Subprogram without PROC operation

Program code	Comment
N10 G01 G90 G64 F1000	
N20 X10 Y20	
...	
N100 RET	; Subprogram return

See also

Subprogram call without parameter transfer (Page 189)

2.24.2.2 Subprogram with call-by-value parameter transfer (PROC)

A subprogram with call-by-value parameter transfer is defined using the `PROC` keyword followed by the name of the program and a complete list of all the parameters with their type and name. The definition operation must appear in the first program line.

Call-by-value

The calling program transfers only the value of a variable to the subprogram on a call-by-value parameter transfer. Thus the subprogram is not given direct access to the variable. In this way, only the value visible in the subprogram is modified when the parameter value is changed. The value of the variables defined in the calling program remains unchanged. As a consequence, the call-by-value parameter transfer does not affect the calling program.

Syntax

```
PROC <program name> (<parameter type> <parameter
name>=<init_value>, ...)
```

Note

Up to 127 parameters can be transferred.

Meaning

PROC:	Definition operation at the beginning of a program
<program name>:	Name of the program
<parameter type>:	Data type of the parameter (e.g. REAL, INT, BOOL)
<parameter name>:	Name of the parameter
<init_value>:	Optional value for the initialization of the parameter (optional) If no parameter is specified when calling the subprogram, the parameter is assigned the initialization value.

Examples

Example 1

Definition of a subprogram SUB_PROG with three parameters of type REAL with default values:

Program code

```
PROC SUB_PROG (REAL LENGTH=10.0, REAL WIDTH=20.0, REAL HIGHT=30.0)
```

Example 2

Various call versions

Program code

```
PROC MAIN_PROG
  REAL PAR_1 = 100
  REAL PAR_2 = 200
  REAL PAR_3 = 300
  ; Call variants
  SUB_PROG
  SUB_PROG (PAR_1, PAR_2, PAR_3)
  SUB_PROG (PAR_1)
  SUB_PROG (PAR_1, , PAR_3)
  SUB_PROG ( , , PAR_3)
N100 RET
```

Subprogram call with parameter transfer (EXTERN) (Page 191)

2.24.2.3 Subprogram with call-by-reference parameter transfer (PROC, VAR)

A subprogram with call-by-reference parameter transfer is defined using the `PROC` keyword followed by the name of the program and a complete list of all the parameters with the `VAR` keyword, type, and name. The definition operation must appear in the first program line. As parameters, references to arrays can also be transferred.

Call-by-reference

The calling program transfers not the value of a variable to the subprogram on a call-by-reference parameter transfer, but a reference (pointer) to the variable. This gives the subprogram direct access to the variable. In this way, not only the value visible in the subprogram is modified when a parameter value is changed, but also the value of the variables defined in the calling program. Call-by-reference parameter transfer therefore affects the calling program, even after the subprogram has ended.

Note

The call-by-reference parameter transfer is then only necessary if the transferred variable was defined locally in the calling program (LUD). Channel-global or NC-global variables do not have to be transferred, since these cannot be accessed directly from within the subprogram.

Syntax

```
PROC <program name> (VAR <parameter type> <parameter name>, etc.)
PROC <program name> (VAR <array type> <array name>, [<m>,<n>,<o>],
etc.)
```

Note

Up to 127 parameters can be transferred.

Meaning

PROC:	Definition operation at the beginning of a program
VAR:	Keyword for parameter transfer via reference
<program name>:	Name of the program
<parameter type>:	Data type of the parameter (e.g. REAL, INT, BOOL)
<parameter name>:	Name of the parameter
<array type>:	Data type of the array elements (e.g. REAL, INT, BOOL)
<array name>:	Name of the array

[<m>, <n>, <o>]:	Array size	
	Currently, up to 3-dimensional arrays are possible:	
	<m>:	Array size for 1st dimension
	<n>:	Array size for 2nd dimension
	<o>:	Array size for 3rd dimension

Note

- The program name specified after the `PROC` keyword must match the program name assigned on the user interface.
- With arrays of an undefined array length, subprograms can process arrays of variable length as formal parameter. When defining a two-dimensional array as a formal parameter, for example, the length of the 1st dimension is not specified. However, the comma must be written.

Example: `PROC <program name> (VAR REAL ARRAY[,5])`

Example

Definition of a subprogram with two parameters as reference to REAL type:

Program code

```
; Parameter 1: Reference to type: REAL, name: LENGTH
; Parameter 2: Reference to type: REAL, name: WIDTH
PROC SUB_PROG(VAR REAL LENGTH, VAR REAL WIDTH)
```

See also

Subprogram call with parameter transfer (EXTERN) (Page 191)

2.24.2.4 Save modal G functions (SAVE)

The `SAVE` attribute means that before the subprogram call, active modal G commands are saved and are reactivated after the end of the subprogram.

NOTICE**Interrupt continuous-path mode**

If, for active continuous-path mode, a subprogram is called with the `SAVE` attribute, the continuous-path mode is interrupted at the end of the subprogram (return jump).

Syntax

```
PROC <subprogram name> SAVE
```

Meaning

SAVE:	Saves the modal G commands before the subprogram call and restores after the end of the subprogram.
-------	---

Example

In the CONTOUR subroutine, the modal G command G91 incremental dimension applies. The modal G command G90 is effective in the main program (absolute dimension). G90 is again effective in the main program after the end of the subprogram due to the subprogram definition with SAVE.

Subprogram definition:

Program code	Comment
PROC CONTOUR (REAL VALUE1) SAVE	; Subprogram definition with the SAVE parameter
N10 G91 ...	; Modal G command G91: Incremental dimension
N100 M17	; End of subprogram

Main program:

Program code	Comment
N10 G0 X... Y... G90	; Modal G command G90: Absolute dimensions
N20 ...	
...	
N50 CONTOUR (12.4)	; Subprogram call
N60 X... Y...	; Modal G command G90 reactivated using SAVE

Supplementary conditions

Frames

The behavior of frames regarding subprograms with the SAVE attribute depends on the frame time and can be set using machine data.

References

Function Manual, Basic Functions; Axes, Coordinate Systems, Frames (K2),
Section: "Subprogram return with SAVE"

2.24.2.5 Suppress single block execution (SBLOF, SBLON)

Single-block suppression for the complete program

Programs designated with SBLOF are completely executed just like a block when single-block execution is active, i.e. single-block execution is suppressed for the complete program.

SBLOF is in the PROC line and is valid up to the end of the subprogram or until it is interrupted. At the return command, the decision is made whether to stop at the end of the subprogram:

Return jump with M17: Stop at the end of the subprogram

Return jump with RET: No stop at end of subprogram

Single-block suppression within the program

SBLOF alone must remain in the block. Single block is deactivated after this block until:

- The next SBLON
or
- The end of the active subprogram level

Syntax

Single-block suppression for the complete program:

```
PROC ... SBLOF
```

Single-block suppression within the program:

```
SBLOF
```

```
...
```

```
SBLON
```

Meaning

PROC:	First operation in a program
SBLOF:	Command to deactivate single-block execution SBLOF can be written in a PROC block or alone in the block.
SBLON:	Command to activate single-block execution SBLON must be in a separate block.

Supplementary conditions

- **Single-block suppression and block display**
The current block display can be suppressed in cycles/subprograms using `DISPLOF`. If `DISPLOF` is programmed together with `SBL0F`, then the cycle/subprogram call continues to be displayed on single-block stops within the cycle/subprogram.
- **Single-block suppression in the system ASUB or user ASUB**
If the single-block stop in the system or user ASUB is suppressed using the settings in machine data `MD10702 $MN_IGNORE_SINGLEBLOCK_MASK` (bit0 = 1 or bit1 = 1), then the single-block stop can be reactivated by programming `SBLON` in the ASUB.
If the single-block stop in the user ASUB is suppressed using the setting in machine data `MD20117 $MC_IGNORE_SINGLEBLOCK_ASUP`, then the single-block stop **cannot** be reactivated by programming `SBLON` in the ASUB.
- **Special features of single-block suppression for various single-block execution types**
When single-block execution `SBL2` is active (stop after each part program block) there is **no** execution stop in the `SBLON` block if bit 12 is set to "1" in the `MD10702 $MN_IGNORE_SINGLEBLOCK_MASK` (prevent single-block stop).
When single-block execution `SBL3` is active (stop after every part program block - also in the cycle), the `SBL0F` command is suppressed.

Examples

Example 1: Single-block suppression within a program

Program code	Comment
N10 G1 X100 F1000	
N20 SBL0F	; Deactivate single block.
N30 Y20	
N40 M100	
N50 R10=90	
N60 SBLON	; Reactivate single block.
N70 M110	
N80 ...	

The area between `N20` and `N60` is executed as one step in single-block mode.

Example 2: A cycle is to act like a command for a user

Main program:

Program code
N10 G1 X10 G90 F200
N20 X-4 Y6
N30 CYCLE1
N40 G1 X0
N50 M30

Cycle CYCLE1:

Program code	Comment
N100 PROC CYCLE1 DISPLOF SBLOF	; Suppress single block
N110 R10=3*SIN(R20)+5	
N120 IF (R11 <= 0)	
N130 SETAL(61000)	
N140 ENDIF	
N150 G1 G91 Z=R10 F=R11	
N160 M17	

CYCLE1 is processed for active single-block execution, i.e. the Start key must be pressed once to process CYCLE1.

Example 3: An ASUB, which is started by the PLC in order to activate a modified zero offset and tool offsets, is to be executed invisibly.

Program code
N100 PROC ZO SBLOF DISPLOF
N110 CASE \$P_UIFRNUM OF
0 GOTOF _G500
1 GOTOF _G54
2 GOTOF _G55
3 GOTOF _G56
4 GOTOF _G57
DEFAULT GOTOF END
N120 _G54: G54 D=\$P_TOOL T=\$P_TOOLNO
N130 RET
N140 _G55: G55 D=\$P_TOOL T=\$P_TOOLNO
N150 RET
N160 _G56: G56 D=\$P_TOOL T=\$P_TOOLNO
N170 RET
N180 _G57: G57 D=\$P_TOOL T=\$P_TOOLNO
N190 RET
N200 END: D=\$P_TOOL T=\$P_TOOLNO
N210 RET

Example 4: Is not stopped with MD10702 Bit 12 = 1

Initial situation:

- Single-block execution is active.
- MD10702 \$MN_IGNORE_SINGLEBLOCK_MASK Bit12 = 1

Main program:

Program code	Comment
N10 G0 X0	; Stop in this part program line.
N20 X10	; Stop in this part program line.
N30 CYCLE	; Traversing block generated by the cycle.
N50 G90 X20	; Stop in this part program line.
M30	

Cycle CYCLE:

Program code	Comment
PROC CYCLE SBLOF	; Suppress single-block stop.
N100 R0 = 1	
N110 SBLON	; Execution is not stopped in the part program line due to the fact that MD10702 bit12=1.
N120 X1	; Execution is stopped in this part program line.
N140 SBLOF	
N150 R0 = 2	
RET	

Example 5: Single-block suppression for program nesting

Initial situation:

Single-block execution is active.

Program nesting:

Program code	Comment
N10 X0 F1000	; Execution is stopped in this block.
N20 UP1(0)	
PROC UP1(INT _NR) SBLOF	; Suppress single-block stop.
N100 X10	
N110 UP2(0)	
PROC UP2(INT _NR)	
N200 X20	
N210 SBLON	; Activate single-block stop.
N220 X22	; Execution is stopped in this block.
N230 UP3(0)	
PROC UP3(INT _NR)	
N300 SBLOF	; Suppress single-block stop.
N305 X30	
N310 SBLON	; Activate single-block stop.
N320 X32	; Execution is stopped in this block.

Program code	Comment
N330 SBLOF	; Suppress single-block stop.
N340 X34	
N350 M17	; SBLOF is active.
N240 X24	; Execution is stopped in this block. SBLON is active.
N250 M17	; Execution is stopped in this block. SBLON is active.
N120 X12	
N130 M17	; Execution is stopped in this return jump block. SBLOF of the PROC statement is active.
N30 X0	; Execution is stopped in this block.
N40 M30	; Execution is stopped in this block.

Further information

Single-block disable for unsynchronized subprograms

In order to execute an ASUB in one step, a PROC statement must be programmed in the ASUB with SBLOF. This also applies to the function "Editable system ASUB" (MD11610 \$MN_ASUP_EDITABLE).

Example of an editable system ASUB:

Program code	Comments
N10 PROC ASUB1 SBLOF DISPLOF	
N20 IF \$AC_ASUP=='H200'	
N30 RET	; No REPOS for mode change.
N40 ELSE	
N50 REPOSA	; REPOS in all other cases.
N60 ENDIF	

Program control in single-block mode

With the single-block execution function, the user can execute a part program block-by-block. The following setting types exist:

- SBL1: IPO single block with stop after each machine function block.
- SBL2: Single block with stop after each block.
- SBL3: Stop in the cycle (the SBLOF command is suppressed by selecting SBL3).

Single-block suppression for program nesting

If SBLOF was programmed in the PROC statement in a subprogram, then execution is stopped at the subprogram return jump with M17. That prevents the next block in the calling program from already running. If SBLOF, without SBLON is programmed in the PROC statement in a subprogram, single-block suppression is activated, execution is only stopped after the next machine function block of the calling program. If that is not wanted, SBLON must be programmed in the subprogram before the return (M17). Execution does not stop for a return jump to a higher-level program with RET.

2.24.2.6 Suppress current block display (DISPLOF, DISPLON, ACTBLOCNO)

The current program block is displayed as standard in the block display. The display of the current block can be suppressed in cycles and subprograms using the `DISPLOF` command. Instead of the current block, the call of the cycle or the subprogram is displayed. The `DISPLON` command revokes suppression of the block display.

`DISPLOF` and `DISPLON` are programmed in the program line with the `PROC` operation and are effective for the entire subprogram and implicitly for all subprograms called from it which do not contain a `DISPLON` or `DISPLOF` command. This is true for all ASUBs.

Syntax

```
PROC ... DISPLOF
PROC ... DISPLOF ACTBLOCNO
PROC ... DISPLON
```

Meaning

DISPLOF:	Command to suppress the current block display.	
	Location:	At the end of the program line with the <code>PROC</code> operation
	Effective:	Up to the return jump from the subprogram or end of program.
	Note: If further subprograms are called from the subprogram using the <code>DISPLOF</code> command, then the current block display is also suppressed in these subprograms unless <code>DISPLON</code> is explicitly programmed in them.	
DISPLON:	Command for revoking suppression of the display of the current block	
	Location:	At the end of the program line with the <code>PROC</code> operation
	Effective:	Up to the return jump from the subprogram or end of program.
	Note: If further subprograms are called from the subprogram using the <code>DISPLON</code> command, then the current block will also be displayed in these subprograms unless <code>DISPLOF</code> is explicitly programmed in them.	
ACTBLOCNO:	<code>DISPLOF</code> together with the <code>ACTBLOCNO</code> attribute means that in the case of an alarm, the number of the actual block is output in which the alarm occurred. This also applies if only <code>DISPLOF</code> is programmed in a lower program level.	
	On the other hand, for <code>DISPLOF</code> without <code>ACTBLOCNO</code> , the block number of the cycle or subprogram call from the last program level not designated with <code>DISPLOF</code> is displayed.	

Examples

Example 1: Suppress current block display in the cycle

Program code	Comment
PROC CYCLE (AXIS TOMOV, REAL POSITION) SAVE DISPLOF	; Suppress current block display Instead, the cycle call should be displayed, e.g.: CYCLE (X,100.0)
DEF REAL DIFF	;Cycle contents
G01 ...	

Program code	Comment
...	
RET	; Subprogram return jump. The block following the cycle call is displayed in the block display.

Example 2: Block display for alarm output

Subprogram SUBPROG1 (with ACTBLOCNO):

Program code	Comment
PROC SUBPROG1 DISPLOF ACTBLOC-	
NO	
N8000 R10 = R33 + R44	
...	
N9040 R10 = 66 X100	; Trigger alarm 12080
...	
N10000 M17	

Subprogram SUBPROG2 (without ACTBLOCNO):

Program code	Comment
PROC SUBPROG2 DISPLOF	
N5000 R10 = R33 + R44	
...	
N6040 R10 = 66 X100	; Trigger alarm 12080
...	
N7000 M17	

Main program:

Program code	Comment
N1000 G0 X0 Y0 Z0	
N1010 ...	
...	
N2050 SUBPROG1	; Alarm output = "12080 channel K1 block N9040 syntax error for text R10="
N2060 ...	
N2350 SUBPROG2	; Alarm output = "12080 channel K1 block N2350 syntax error for text R10="
...	
N3000 M30	

Example 3: Revoke suppression of the current block display

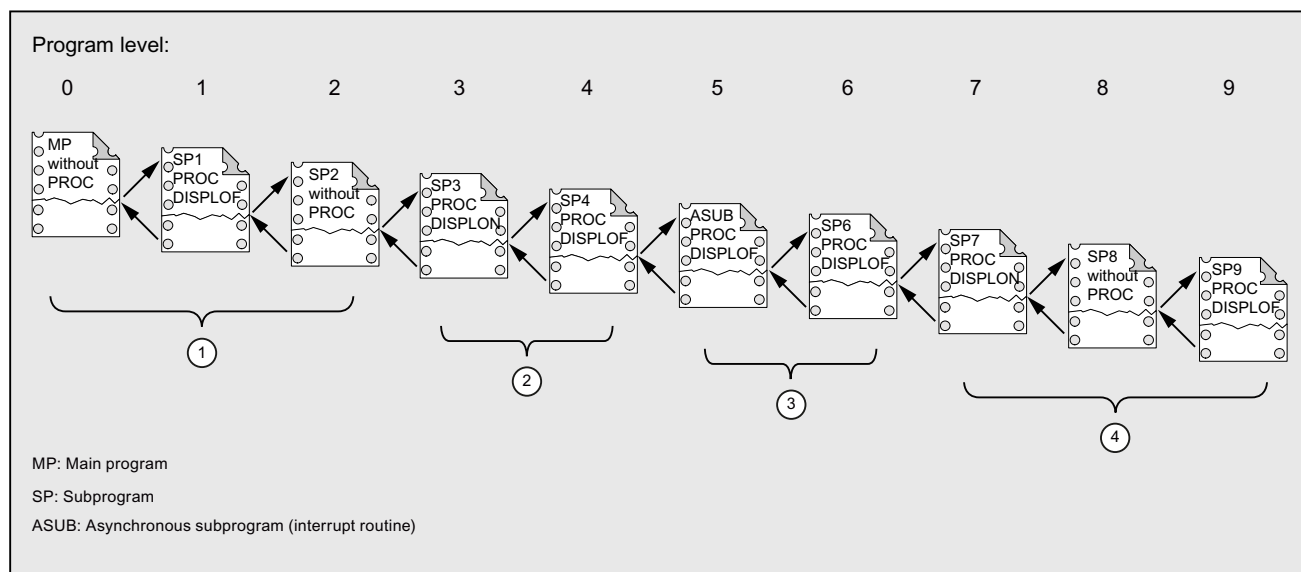

Subprogram SUB1 with suppression:

Program code	Comment
PROC SUB1 DISPLOF	; Suppress current block display in SUB1 subprogram. Instead, the block is to be displayed with the SUB1 call.
...	
N300 SUB2	; Call subprogram SUB2.
...	
N500 M17	

Subprogram SUB2 without suppression:

Program code	Comment
PROC SUB2 DISPLON	; Revoke suppression of the current block display in subprogram SUB2.
...	
N200 M17	; Return to subprogram SUB1. Suppression of the current block display is restored in SUB1.

Example 4: Display response for different DISPLON/DISPLOF combinations

- ① The part program lines from program level 0 are displayed in the current block display.
- ② The part program lines from program level 3 are displayed in the current block display.
- ③ The part program lines from program level 3 are displayed in the current block display.
- ④ The part program lines from program level 7/8 are displayed in the current block display.

2.24.2.7 Identifying subprograms with preparation (PREPRO)

All files can be identified with the `PREPRO` keyword at the end of the `PROC` operation line during power up.

Note

This type of program preparation depends on the relevant set machine data. Please follow the manufacturer's instructions.

References:

Function Manual, Special Functions, Preprocessing (V2)

Syntax

```
PROC ... PREPRO
```

Meaning

PREPRO:	Keyword for identifying all files (of the NC programs stored in the cycle directories) prepared during power up
---------	---

Read subprogram with preparation and subprogram call

The cycle directories are processed in the same order both for subprograms preprocessed with parameters during power up and during subprogram call.

1. `_N_CUS_DIR` user cycles
2. `_N_CMA_DIR` manufacturer cycles
3. `_N_CST_DIR` standard cycles

In the case of NC programs sharing the same name but having different characteristics, the first `PROC` operation found is activated and the other `PROC` operation is overlooked without an alarm message.

2.24.2.8 Subprogram return M17

The return command `M17` (or the part program end command `M30`) appears at the end of a subprogram. It prompts the return to the calling program at the part program block following the subprogram call.

Note

`M17` and `M30` are treated as equivalents in the NC language.

Syntax

```
PROC <program name>
```

...
M17/M30

Supplementary conditions

Effect of the subprogram return on continuous-path mode

If M17 (or M30) appears on its own in the part program block, active continuous-path mode in the channel will be interrupted.

To avoid continuous-path mode being interrupted, M17 (or M30) has to be included in the last traversing block. Furthermore, the following machine data must be set to "0":

MD20800 \$MC_SPF_END_TO_VDI = 0 (no M30/M17 output to the NC/PLC interface)

Example

1. Subprogram with M17 in a separate block

Program code	Comment
N10 G64 F2000 G91 X10 Y10	
N20 X10 Z10	
N30 M17	; Return jump with interruption of continuous-path mode.

2. Subprogram with M17 in the last traversing block

Program code	Comment
N10 G64 F2000 G91 X10 Y10	
N20 X10 Z10 M17	; Return jump without interruption of continuous-path mode.

2.24.2.9 RET subprogram return

The RET command can also be used in the subprogram as a substitute for the M17 return jump command. RET must be programmed in a separate part program block. Like M17, RET prompts the return to the calling program at the part program block following the subprogram call.

Note

Parameters can be programmed to change the return jump behavior of RET (see "Parameterizable subprogram return jump (RET ...) (Page 178)").

Application

The RET operation should then be used if a G64 continuous-path mode (G641 to G645) is not to be interrupted by the return jump.

Requirement

The `RET` command can only be used in subprograms, which were not defined with the `SAVE` attribute.

Syntax

```
PROC <program name>
...
RET
```

Example

Main program:

Program code	Comment
PROC MAIN_PROGRAM	; Start of the program
...	
N50 SUB_PROG	; Subprogram call: SUB_PROG
N60 ...	
...	
N100 M30	; End of program

Subprogram:

Program code	Comment
PROC SUB_PROG	
...	
N100 RET	; Return jump to block N60 in the main program.

2.24.2.10 Parameterizable subprogram return jump (RET ...)

Generally, a return jump is made from a subprogram into the calling program using the `RET` command. Processing is then continued with the program line following the subprogram call. The following options are available if program processing is to be continued at another location:

- Resuming program execution after calling the stock removal cycles in the ISO dialect mode (after describing the contour).
- Return to main program from any subprogram level (even after `ASUB`) for error handling.
- Return jump through several program levels for special applications in compile cycles and in the ISO dialect mode.

To achieve this, the `RET` command should be programmed with additional parameters.

Search direction

When specifying parameter `<target block>`, a return jump is first made to the block after the calling block. A search is then made for the target in the direction of the **end** of the program

into which a return jump was made. A search is made toward the start of the program if the search was not successful.

Syntax

```
RET("<target block>")  
RET("<target block>",<block after target block>)  
RET("<target block>",<block after target block> <number of return  
jump levels>)  
RET("<target block>",<number of return jump levels>)  
RET("<target block>",<block after target block>,<number of return  
jump levels>,  
<return jump to the beginning of the program>)  
RET( , ,<number of return jump levels>,<return jump to the beginning  
of the program>)
```

Meaning

RET:	End of subprogram			
<target block>:	Declares as jump target the block where program execution should be resumed. If parameter < number of return jump levels> is not programmed, then the jump target is in the program from which the current subprogram was called. Possible data include:			
	<block number>	Number of the target block. The search for the block number is realized in the program to which a return jump was made initially in the direction toward the end of the program.		
	<jump marker>	Jump marker, which must be available in the program into which a return jump is made. The search for the jump marker is realized in the program to which a return jump was made initially in the direction toward the end of the program.		
	<character string>	Character string that must be available in the program into which a return jump is made (e.g. program or variable name). The search for the character string is realized in the program to which a return jump was made initially in the direction toward the end of the program. The following rules apply when programming the character string: <ul style="list-style-type: none">• Blank at the end (contrary to the jump marker, which is identified by ":" at the end).• Before the character string only one block number and/or a jump marker may be set, no program commands.		
<block after target block>:	The parameter specifies as to whether program processing should be continued in the block specified under parameter <target block> or in the following block.			
	Type:	INT		
	Value:	0	The return jump is made to the block specified in parameter <target block>.	
		> 0	The return jump is made to the next block specified in parameter <target block>.	

<number of return jump levels>:	The parameter specifies the number of program levels that should be jumped through (return jumps) to search there for the target block and continue processing the program.		
	Type:	INT	
	Value:	1	The program is resumed at the "current program level - 1" (like <code>RET</code> without parameter).
		2	The program is resumed at the "current program level - 2", i.e. one level is skipped.
		3	The program is resumed at the "current program level - 3", i.e. two levels are skipped.
		...	
Range of values:	1 ... 15		
<return jump to the beginning of the program>:	The parameter specifies whether, for a return jump into the main program, the program should be continued at the start of the program in the active ISO dialect mode .		
	Type:	BOOL	
	Value:	1	If the return jump is made into the main program and an ISO dialect mode is active there, then the program branches to the beginning of the program.

Note

For a subprogram return jump with a character string to specify the target block search, initially, a search is always made for a jump marker in the calling program.

If a jump target is to be uniquely defined using a character string, it is not permissible that the character string matches the name of a jump marker, as otherwise the subprogram return jump would always be made to the jump marker and not to the character string (refer to example 2).

Supplementary conditions

When making a return jump through several program levels, the `SAVE` statements of the individual program levels are evaluated.

If, for a return jump over several program levels, a modal subprogram is active and if in one of the skipped programs the deselection command `MCALL` is programmed for the modal subprogram, then the modal subprogram remains active.

NOTICE**Programming error**

For a return jump through several program levels it is the user's responsibility to ensure that processing is continued with the necessary modal settings. This can be achieved, e.g. by programming an appropriate main block.

Examples

Example 1: Resuming in the main program after ASUB execution

Programming	Comment
N10010 CALL "UP1"	; Program level 0 (main program)
N11000 PROC UP1	; Program level 1
N11010 CALL "UP2"	
N12000 PROC UP2	; Program level 2
...	
N19000 PROC ASUP	; Program level 3 (ASUB execution)
...	
N19100 RET("N10900", , \$P_STACK)	; Subprogram return jump into the main program
	; \$P_STACK: actual program level
N10900	; Target block in the main program
N10910 MCALL	; Deactivate the modal subprogram call
N10920 G0 G60 G40 M5	; Initialize additional modal settings

Example 2: Character string (string>) to specify the target block search

Main program:

Program code	Comment
PROC MAIN_PROGRAM	
N1000 DEF INT iVar1=1, iVar2=4	
N1010 ...	
N1200 subProg1	; Calls subprogram "subProg1"
N1210 M2 S1000 X10 F1000	
N1220	
N1400 subProg2	; Calls subprogram "subProg2"
N1410 M3 S500 Y20	
N1420 ..	
N1500 lab1: iVar1=R10*44	
N1510 F500 X5	
N1520 ...	
N1550 subprog1: G1 X30	; "subProg1" is defined here as jump marker.
N1560 ...	
N1600 subProg3	; Calls subprogram "subProg3"
N1610 ...	
N1900 M30	

Subprogram subProg1:

Program code	Comment
PROC subProg1	

Program code	Comment
N2000 R10=R20+100	
N2010 ...	
N2200 RET("subProg2")	; Return jump into the main program at block N1400

Subprogram subProg2:

Program code	Comment
PROC subProg2	
N2000 R10=R20+100	
N2010 ...	
N2200 RET("iVar1")	; Return jump into the main program at block N1500

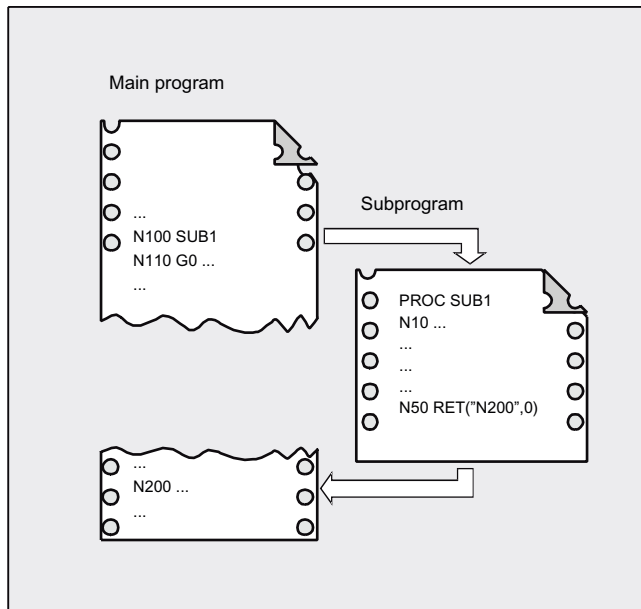

Subprogram subProg3:

Program code	Comment
PROC subProg3	
N2000 R10=R20+100	
N2010 ...	
N2200 RET("subProg1")	; Return jump into the main program at block N1550

Additional information

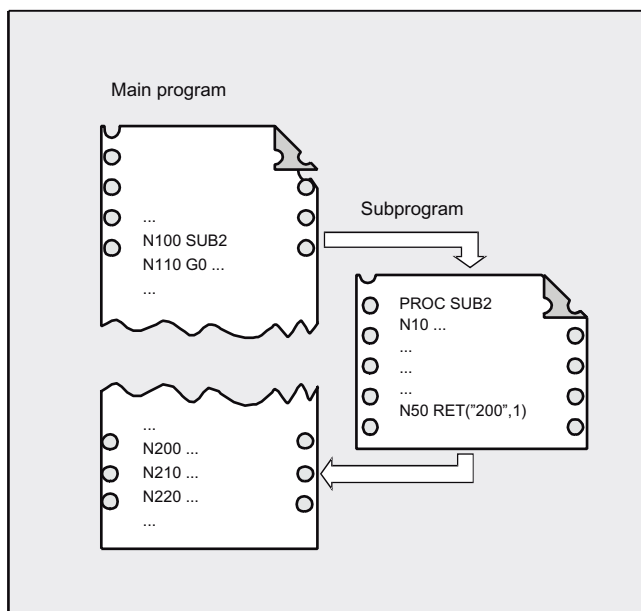

The following diagrams show the different effects of return jump parameters

1. <target block> = "N200", <block after target block> = 0

After the `RET` command, program execution is continued with block N200 in the main program.

2. <target block> = "N200", <block after target block> = 1

After the `RET` command, program execution is continued with the block (N210) that follows block N200 in the main program.

3. <target block> = "N220", <number of return jump levels> = 2

After the RET command, two program levels are jumped through and program execution is continued with block N220.

2.24.2.11 Parameterizable subprogram return jump (RETB ...)

Generally, a return jump is made from a subprogram into the calling program using the RETB command. Processing is then continued with the program line following the subprogram call. The following options are available if program processing is to be continued at another location:

- Resume program execution after calling the stock removal cycles in the ISO dialect mode (after describing the contour).
- Return to main program from any subprogram level (even after ASUB) for error handling.
- Return jump through several program levels for special applications in compile cycles and in the ISO dialect mode.

To achieve this, the RETB command should be programmed with additional parameters.

Search direction

When specifying parameter <target block>, a return jump is first made to the block after the calling block. A search is then made for the target in the direction of the **beginning** of the program into which a return jump was made. A search is made toward the end of the program if the search was not successful.

Syntax

```
RETB("<target block>")
RETB("<target block>",<block after target block>)
RETB("<target block>",<block after target block> <number of return
jump levels>)
RETB("<target block>",<number of return jump levels>)
```

```

RETB("<target block>",<block after target block>,<number of return
jump levels>,
<return jump to the beginning of the program>)
RETB( , ,<number of return jump levels>,<return jump to the beginning
of the program>)

```

Meaning

RETB:	End of subprogram	
<target block>:	<p>Declares as jump target the block where program execution should be resumed.</p> <p>If parameter < number of return jump levels> is not programmed, then the jump target is in the program from which the current subprogram was called.</p> <p>Possible data include:</p>	
	<block number>	<p>Number of the target block.</p> <p>The search for the block number is realized in the program to which a return jump was made initially in the direction toward the beginning of the program.</p>
	<jump marker>	<p>Jump marker, which must be available in the program into which a return jump is made.</p> <p>The search for the jump marker is realized in the program to which a return jump was made initially in the direction toward the beginning of the program.</p>
	<character string>	<p>Character string that must be available in the program into which a return jump is made (e.g. program or variable name).</p> <p>The search for the character string is realized in the program to which a return jump was made initially in the direction toward the beginning of the program.</p> <p>The following rules apply when programming the character string:</p> <ul style="list-style-type: none"> • Blank at the end (contrary to the jump marker, which is identified by ":" at the end). • Before the character string only one block number and/or a jump marker may be set, no program commands.
<block after target block>:	The parameter specifies as to whether program processing should be continued in the block specified under parameter <target block> or in the following block.	
	Type:	INT
	Value:	0 The return jump is made to the block specified in parameter <target block>.
		> 0 The return jump is made to the next block specified in parameter <target block>.

<number of return jump levels>:	The parameter specifies the number of program levels that should be jumped through (return jumps) to search there for the target block and continue processing the program.		
	Type:	INT	
	Value:	1	The program is resumed at the "current program level - 1" (like <code>RET</code> without parameter).
		2	The program is resumed at the "current program level - 2", i.e. one level is skipped.
		3	The program is resumed at the "current program level - 3", i.e. two levels are skipped.
		...	
Range of values:	1 ... 15		
<return jump to the beginning of the program>:	The parameter specifies whether, for a return jump into the main program, the program should be continued at the start of the program in the active ISO dialect mode .		
	Type:	BOOL	
	Value:	1	If the return jump is made into the main program and an ISO dialect mode is active there, then the program branches to the beginning of the program.

Note

For a subprogram return jump with a character string to specify the target block search, initially, a search is always made for a jump marker in the calling program.

If a jump target is to be uniquely defined using a character string, it is not permissible that the character string matches the name of a jump marker, as otherwise the subprogram return jump would always be made to the jump marker and not to the character string (refer to example 2).

Supplementary conditions

When making a return jump through several program levels, the `SAVE` statements of the individual program levels are evaluated.

If, for a return jump over several program levels, a modal subprogram is active and if in one of the skipped programs the deselection command `MCALL` is programmed for the modal subprogram, then the modal subprogram remains active.

NOTICE**Programming error**

For a return jump through several program levels it is the user's responsibility to ensure that processing is continued with the necessary modal settings. This can be achieved, e.g. by programming an appropriate main block.

Example

Program code	Comment
EXAMPLE.MPF	
...	
N3000 START_CYC(param1, param2, ...)	
N3010 TECH_CYC1(param1, param2, ...)	
N3020 TECH_CYC2(param1, param2, ...)	
N3030 TECH_CYC3(param1, param2, ...)	
N3040 END_CYC(param1, param2, ...)	
N3040 END_CYC (param1, param2, ...)	
N3050 ...	
N4500 START_CYC(param11, param12, ...)	
N4510 ...	
N4590 END_CYC(param11, param12, ..)	
N5000 ...	
...	
N6000 M30	

Program code	Comment
PROC END_CYC(...)	; Call in the main program, line N3040
N10000 ...	
N15000 if status == 1	
N15010 RETB("START_CYC")	; Return jump to the calling program EXAMPLE.MPF
	; Search for character string "START_CYC"
	; Search direction: backward in the program start
	direction
	; Program processing is continued with line N3000
N15020 endif	
N15030 if status == 0	
N15040 RET	; Return jump to the calling program EXAMPLE.MPF
	; Program processing is continued with line N3050
N15050 endif	
N16000 RET("START_CYC")	; Return jump to the calling program EXAMPLE.MPF
	; Search for character string "START_CYC"
	; Search direction: forward in the program end di-
	rection
	; Program processing is continued with line N4500
N17060 RETB	; Return jump to the calling program EXAMPLE.MPF
	; Program processing is continued with line N3050
	; RETB without parameter is identical to RET

2.24.3 Subprogram call

2.24.3.1 Subprogram call without parameter transfer

A subprogram is called either with address L and subprogram number or by specifying the program name.

A main program can also be called as a subprogram. The end of program M2 or M30 set in the main program is evaluated as M17 in this case (end of program with return to the calling program).

Note

Accordingly, a subprogram can also be started as a main program.

Search strategy of the control:

Are there any *_MPF?

Are there any *_SPF?

This means, if the name of the subprogram to be called is identical to the name of the main program, the main program that issued the call is called again. This is generally an undesirable effect and must be avoided by assigning unique names to subprograms and main programs.

Note

Subprograms not requiring parameter transfer can also be called from an initialization file.

Syntax

L<number>/<program name>

Note

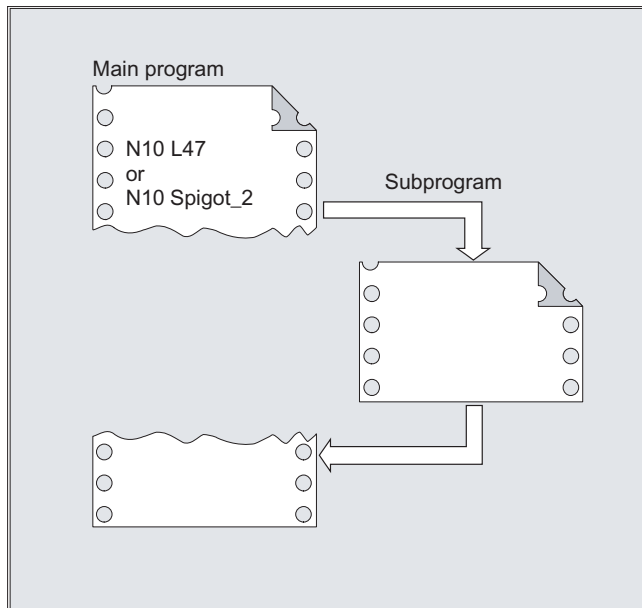

The subprogram call must always be programmed in a separate NC block.

Meaning

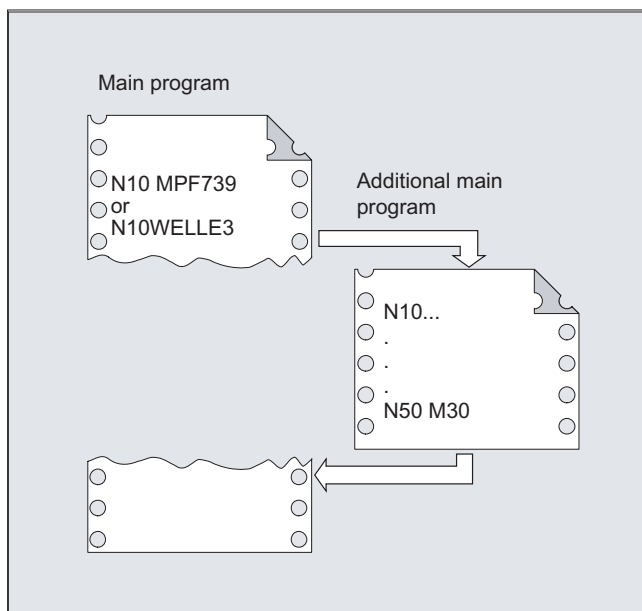

L:	Address for the subprogram call	
<number>:	Name of the subprogram	
	Type:	INT
	Value:	Maximum 7 decimal places Notice: Leading zeros are significant in names (⇒ L123, L0123 and L00123 are three different subprograms).
<program name>:	Name of the subprogram (or main program)	

Examples

Example 1: Subprogram call without parameter transfer

Example 2: Calling a main program as a subprogram

See also

Subprogram without parameter transfer (Page 162)

2.24.3.2 Subprogram call with parameter transfer (EXTERN)

For a subprogram call with parameter transfer, variables or values can be transferred directly (but not `VAR` parameters).

Subprograms with parameter transfer must be declared with `EXTERNAL` in the main program before they are called in the main program (e.g. at the beginning of the program). The name of the subprogram and the variable types are thereby specified in the sequence in which they are transferred.

NOTICE

Risk of confusion

Both the variable types and the sequence of the transfer must match the definitions declared under `PROC` in the subprogram. The parameter names can be different in the main program and the subprogram.

Syntax

```
EXTERNAL <program name>(<type_Par1>,<type_Par2>,<type_Par3>)
...
<program name>(<value_Par1>,<value_Par2>,<value_Par3>)
```

Note

The subprogram call must always be programmed in a separate NC block.

Meaning

<program name>:	Name of subprogram
EXTERNAL:	Keyword to declare a subprogram with parameter transfer. Note: You only have to specify <code>EXTERNAL</code> if the subprogram is in the workpiece or in the global subprogram directory. Cycles do not have to be declared as <code>EXTERNAL</code> .
<type_par1>,<type_par2>,<type_par3>:	Variable types of the parameters to be transferred in the sequence of the transfer
<value_par1>,<value_par2>,<value_par3>:	Variable values for the parameters to be transferred

Examples

Example 1: Subprogram call preceded by declaration

Program code	Comment
N10 EXTERNAL BORDERS (REAL,REAL,REAL)	; Specify the subprogram.
...	
N40 BORDER (15.3,20.2,5)	; Call the subprogram with parameter transfer.

Example 2: Subprogram call without declaration

Program code	Comment
N10 DEF REAL LENGTH, WIDTH, DEPTH	
N20 ...	
N30 LENGTH=15.3 WIDTH=20.2 DEPTH=5	
N40 BORDER (LENGTH,WIDTH,DEPTH)	; or: N40 BORDER (15.3,20.2,5)

See also

Subprogram with call-by-value parameter transfer (PROC) (Page 162)

Subprogram with call-by-reference parameter transfer (PROC, VAR) (Page 164)

2.24.3.3 Number of program repetitions (P)

If a subprogram is to be executed several times in succession, the desired number of program repetitions can be entered at address **P** in the block with the subprogram call.

⚠ CAUTION

Subprogram call with program repetition and parameter transfer

Parameters are transferred only when the program is called, i.e., on the first run. The parameters remain unchanged for the remaining repetitions. If you want to change the parameters during program repetitions, you must make the appropriate provision in the subprogram.

Syntax

<program name> P<value>

Meaning

<program name>:	Subprogram call
P:	Address to program program repetitions

<value>:	Number of program repetitions	
	Type:	INT
	Range of values:	1 ... 9999 (unsigned)

Example

Program code	Comment
...	
N40 FRAME P3	; The BORDER subprogram is to be executed three times one after the other.
...	

2.24.3.4 Modal subprogram call (MCALL)

The specified subprogram is not immediately called as a result of the modal subprogram call `MCALL(<program name>)`. Instead, the call is performed as of this time in the part program after each traversing block with path motion. Also across program levels.

Note

When a program is being executed only the last modal subprogram call `MCALL(<program name>)` is effective (this is always the case). The current modal subprogram call replaces the one that has been active up until then.

If parameters are transferred to the subprogram, the parameters are only transferred with call `MCALL(<program name>(Par1, Par2, ...))`.

NOTICE

Modal subprogram calls without path motion

In the following situations the modal subprogram is also called without programming path motion:

- Programming addresses S or F if G0 or G1 is active.
- If G0 or G1 were programmed alone in the block or with additional G commands.

Syntax

```
MCALL <program name>
...
MCALL
```

Meaning

MCALL <program name>:	Activate the "Modal subprogram call" function
<program name>:	Name of subprogram
MCALL:	The "Modal subprogram call" function is deactivated with MCALL without specification of a program name.

Supplementary conditions

ASUB

If the part program processing is interrupted by an ASUB (see Chapter "Interrupt routine (ASUB) (Page 125)"), then no modal subprogram calls are executed in this ASUB.

If an ASUB is started in the "Reset" channel state, then it behaves just like a normal part program with regard to the modal subprogram calls.

Tool change cycle

If the "Modal subprogram call" function is deselected during the tool change cycle, note that the tool change cycle is called implicitly, even after a block search, via the search ASUB, or manually via overstore. In this situation, the "Modal subprogram call" function must not be deselected because otherwise the search result is falsified. It is therefore recommended that the deselection of the "Modal subprogram call" function in the tool change cycle is programmed as follows:

Program code	Comment
...	
IF \$AC_ASUP == 0	; Call is not performed via search ASUB or overstore.
MCALL	; Deactivate the "Modal subprogram call" function.
ENDIF	

Program code	Comment
...	

Examples

Example 1

Program code	Comment
N10 G0 X0 Y0	
N20 MCALL L70	; Activate the modal subprogram call for L70.
N30 X10 Y10	; X10 Y10 is approached, and then L70 is called.
N40 X20 Y20	; X20 Y20 is approached, and then L70 is called.
...	
N100 MCALL	; Deactivate the "Modal subprogram call" function.
N110 X0 Y0	; X0 Y0 is approached, L70 is not called.

Example 2

Program code
N10 G0 X0 Y0
N20 MCALL L70
N30 L80

In this example, the following NC blocks with programmed path axes are in subprogram L80. L70 is called by L80.

2.24.3.5 Indirect subprogram call (CALL)

Depending on the prevailing conditions at a particular point in the program, different subprograms can be called. The name of the subprogram is stored in a variable of the STRING type. The subprogram call is realized with `CALL` and the variable name.

Note

The indirect subprogram call is only possible for subprograms without parameter transfer. For a direct subprogram call, save the name in a STRING constant.

Syntax

`CALL <program name>`

Meaning

CALL:	Command for the indirect subprogram call.	
<program name>:	Name of the subprogram (variable or constant)	
	Type:	STRING

Example

Direct call with STRING constant:

Program code	Comment
...	
CALL "/_N_WKS_DIR/_N_SUBPROG_WPD/_N_PART1_SPF"	; Direct call to subprogram PART1 with CALL.
...	

Indirect call via variable:

Program code	Comment
...	
DEF STRING[100] PROGNAME	: Define variable.
PROGNAME="/_N_WKS_DIR/_N_SUBPROG_WPD/_N_PART1_SPF"	; Assign subprogram PART1 to the PROGNAME variable.
CALL PROGNAME	; Indirect call to subprogram PART1 via CALL and the PROGNAME variable.
...	

2.24.3.6 Indirect subprogram call with specification of the calling program part (CALL BLOCK ... TO ...)

CALL and the keyword combination BLOCK ... TO is used to call a subprogram indirectly and execute the program section designated by the start and end labels.

Syntax

```
CALL <program name> BLOCK <start label> TO <end label>
CALL BLOCK <start label> TO <end label>
```

Meaning

CALL:	Command for the indirect subprogram call.	
<program name>:	Name of the subprogram (variable or constant) that contains the program section to be executed (specification optional).	
	Type:	STRING
	Note: If a <program name> has not been programmed, the program section designated by <start label> and <end label> is searched for in the current program and executed.	
BLOCK ... TO ... :	Keyword combination for indirect program section execution	
<start label>:	Variable that refers to the start of the program section to be executed.	
	Type:	STRING

<end label>:	Variable that refers to the end of the program section to be executed.	
	Type:	STRING

Example

Main program:

Program code	Comment
...	
DEF STRING[20] STARTLABEL, ENDLABEL	; Variable definition for the start and end labels.
STARTLABEL="LABEL_1"	
ENDLABEL="LABEL_2"	
...	
CALL "CONTUR_1" BLOCK STARTLABEL TO ENDLABEL	; Indirect subprogram call and identifier associated with the calling program section.
...	

Subprogram:

Program code	Comment
PROC CONTUR_1 ...	
LABEL_1	; Start label: Start of program section execution.
N1000 G1 ...	
...	
LABEL_2	; End label: End of program section execution.
...	

2.24.3.7 Indirect call of a program programmed in ISO language (ISOCALL)

A program programmed in an ISO language can be called using the indirect program call **ISOCALL**. The ISO mode set in the machine data is then activated. The original execution mode becomes effective again at the end of the program. If no ISO mode is set in the machine data, the subprogram is called in Siemens mode.

For further information about the ISO mode, see

References:

ISO Dialects Functional Description

Syntax

```
ISOCALL <program_name>
```

Meaning

ISOCALL:	Keyword for an indirect subprogram call with which the ISO mode set in the machine data is activated.
<program name>:	Name of the program programmed in an ISO language (variable or constant, type STRING)

Example: Calling a contour with cycle programming from ISO mode

Program code	Comment
0122_SPF	; Contour description in ISO mode
N1010 G1 X10 Z20	
N1020 X30 R5	
N1030 Z50 C10	
N1040 X50	
N1050 M99	
N0010 DEF STRING[5] PROGNAME = "0122"	; Siemens part program (cycle)
...	
N2000 R11 = \$AA_IW[X]	
N2010 ISOCALL PROGNAME	
N2020 R10 = R10+1	; Execute program 0122.spf in ISO mode
...	
N2400 M30	

2.24.3.8 Call subprogram with path specification and parameters (PCALL)

With PCALL, you can call subprograms with the absolute path and parameter transfer.

Syntax

PCALL <path/program name>(<parameter 1>,...,<parameter n>)

Meaning

PCALL:	Keyword for subprogram call with absolute path name
<path/program name>:	<p>Absolute path data including subprogram names.</p> <p>Rules regarding path data, see "Addressing program memory files (Page 217)".</p> <p>If no absolute path name is specified, PCALL behaves like a standard subprogram call with a program identifier.</p> <p>The program name is specified without prefix and without file identifier. If the program name is to be programmed with prefix and file identifier, then it must be explicitly declared with prefix and file identifier using the EXTERN command.</p>
<parameter 1>, ...:	Actual parameters in accordance with the PROC operation of the subprogram.

Example

Program code
PCALL/_N_WKS_DIR/_N_SHAFT_WPD/SHAFT(parameter1,parameter2,...)

2.24.3.9 Extend search path for subprogram calls (CALLPATH)

The search path for subprogram calls can be extended using the `CALLPATH` command. This means that also subprograms can be called from a non-selected workpiece directory without having to specify the complete, absolute path name of the subprogram.

Another application option is possible in the EES mode "EES without GDIR", if another directory is used on an external program memory to save global subroutines. In this case, using `CALLPATH` the search path can be extended by this subprogram directory.

The search path extension is made before the entry for user cycles (`_N_CUS_DIR`).

The search path extension is deselected again as a result of the following events:

- `CALLPATH` with blanks
- `CALLPATH` without parameter
- End of part program
- Reset

Syntax

`CALLPATH("<path name>")`

Meaning

CALLPATH:	Keyword for the programmable search path extension. Is programmed in a separate part program line.
<path name>:	Constant or variable, STRING type. Contains the absolute path name of the directory by which the search path should be extended. Rules regarding path data, see "Addressing program memory files (Page 217)".

Example

The search path should be extended by a certain workpiece directory:

Program code
...
CALLPATH ("/_N_WKS_DIR/_N_MYWPD_WPD")
...

This means that the following search path is set (position 5. is new):

1. Actual directory/*name*
2. Actual directory/*name_SPF*
3. Actual directory/*name_MPF*
4. //NC:/_N_SPF_DIR / *name_SPF*
5. /_N_WKS_DIR/_N_MYWPD_WPD/*name_SPF*
6. /N_CUS_DIR/*name_SPF*
7. /_N_CMA_DIR/*name_SPF*
8. /_N_CST_DIR/*name_SPF*

Supplementary conditions

- **CALLPATH** checks whether the programmed path name actually exists. In the case of an error, part program execution is interrupted with correction block alarm 14009.
- **CALLPATH** can also be programmed in INI files. It is only effective for the time it takes to process the INI file (WPD-INI file or initialization program for NC active data, e.g. frames in the 1st channel _N_CH1_UFR_INI). The search path is again reset.

2.24.3.10 Execute external subprogram (840D sl) (EXTCALL)

A part program can be loaded from an external memory and executed with the **EXTCALL** command.

The following are available as external memory:

- Local drive
- Network drive
- USB drive

Note

Only the USB interfaces on the operator panel front or the TCU can be used as interface for the processing of an external program on a USB drive.

NOTICE

Tool/workpiece damage when using a USB flash drive

It is recommended that a USB flash drive is not used to execute an external subprogram. A communication interruption to the USB flash drive when executing the subprogram if the flash drive has contact problems, drops out, is interrupted because it has been accidentally knocked or has been inadvertently withdrawn stops the machining immediately. The tool and/or workpiece could be damaged.

Default setting of the external program path

The path for the external program directory can be preset with the setting data:

SD42700 \$SC_EXT_PROG_PATH

Together with the program path and identifier specified with the `EXTCALL` call, this forms the entire path for the subprogram to be called.

Note

Parameter

When calling an external program, none of these parameters can be transferred to it.

Syntax

```
EXTCALL("<path/><program name>")
```

Meaning

EXTCALL:	Command for calling an external subprogram.	
"<path/><program name>":	Constant/variable of type STRING	
	<path>:	Absolute or relative path data (optional)
	<program name>:	<p>The program name is specified without prefix "_N_".</p> <p>The file extension ("MPF", "SPF") can be attached to program names using the "_" or "." character (optional).</p> <p>Example:</p> <pre>"SHAFT" "SHAFT_SPF" "SHAFT.SPF"</pre>

Path specification: Short designations

The following short designations can be used to specify the path:

- Local drive: **"LOCAL_DRIVE:"**
- CF card: **"CF_CARD:"**
- USB drive (operator panel front): **"USB:"**

Alternatively, the abbreviations "CF_CARD:" and "LOCAL_DRIVE:" can be used.

Example

Execute from local drive

The "MAIN.MPF" main program is stored in NC memory and is selected for execution.

Subprogram "SP_1"

The external subprogram "SP_1.SPF" or "SP_1.MPF" is on the local drive in the directory "/user/sinumerik/data/prog/WKS.DIR/WST1.WPD".

The path for the external program directory is set with:

```
SD42700 $SC_EXT_PROG_PATH = LOCAL_DRIVE:WKS.DIR/WST1.WPD
```

Note

Specification of the path for the call of the external subprogram:

- Without the default setting: "LOCAL_DRIVE:WKS.DIR/WST1.WPD/SP_1"
 - With the default setting: "SP_1"
-

Subprogram "SP_2"

The external subprogram "SP_2.SPF" or "SP_2.MPF" is in the WKS.DIR /WST1.WPD directory of the USB drive. The default path setting to the external program directory is used for the path of subprogram "SP_1" and is also not rewritten in the main program. Therefore, the complete path needs to be specified when subprogram "SP_2" is called.

Main program "MAIN"

Program code
N010 PROC MAIN
N020 ...
N030 EXTCALL("SP_1")
N030 EXTCALL("USB:WKS.DIR/WST1.WPD/SP_2")
N050 ...
N060 M30

Additional information

EXTCALL call with absolute path name

If the subprogram exists under the specified path, it is executed with the `EXTCALL` call. If the subprogram does not exist under the specified path, the program execution is aborted with the `EXTCALL` call.

EXTCALL call with relative path name / without path name

In the event of an `EXTCALL` call with a relative path name or without a path name, the available program memories are searched as follows:

1. If a path name is preset in SD42700 \$SC_EXT_PROG_PATH, the data specified in the `EXTCALL` call (program name or with relative path name) is searched for first, starting from this path. The absolute path is obtained from linking the following characters:
 - Default path specification in SD42700 \$SC_EXT_PROG_PATH
 - Separator "/"
 - Path specification and subprogram name in the `EXTCALL` command
2. If the subprogram was not found under 1., the directories of the user memory are searched.

The search ends when the subprogram is found for the first time. If the subprogram is not found, the program execution is aborted with the `EXTCALL` call.

Adjustable reload memory (FIFO buffer)

A reload memory is required for the execution of an external subprogram. The size of the reload memory is preset with 30KB and can only be changed by the machine manufacturer (using MD18360 MM_EXT_PROG_BUFFER_SIZE).

Note

Subprograms with jump commands

For external subprograms that contain jump commands (GOTO, GOTOB, CASE, FOR, LOOP, WHILE, REPEAT, IF, ELSE, ENDIF etc.) the jump destinations must lie within the post loading memory.

Note

ShopMill/ShopTurn programs

The contour descriptions added at the file end mean the ShopMill and ShopTurn programs must be stored completely in the read-only memory.

A separate reload memory is required for external subprograms executed in parallel.

Reset / end of program / POWER ON

Reset and POWER ON cause external subprogram calls to be interrupted and the associated load memory to be deleted.

A program selected for "Execution from external source" remains selected for "Execution from external source" after a reset / end of program. The behavior does not differ from internally selected programs, assuming that the external program memory is still available.

References

Further information on "Execution from external source" can be found in:

Function Manual, Basic Functions, Mode Group, Channel, Program Operation, Reset Behavior (K1)

2.24.3.11 Execute external subprogram (828D) (EXTCALL)

A part program can be loaded from an external memory and executed with the `EXTCALL` command.

The following are available as external memory:

- User CF card
- Network drive
- USB drive

Note

As the interface for the execution of an external program located on a USB drive, only the USB interface of the operator panel front (PPU) may be used.

NOTICE

Tool/workpiece damage when using a USB flash drive

It is recommended that a USB flash drive is not used to execute an external subprogram. A communication interruption to the USB flash drive when executing the subprogram if the flash drive has contact problems, drops out, is interrupted because it has been accidentally knocked or has been inadvertently withdrawn stops the machining immediately. The tool and/or workpiece could be damaged.

Default setting of the external program path

The path for the external program directory can be preset with the setting data:

SD42700 \$SC_EXT_PROG_PATH

Together with the program path and identifier specified with the `EXTCALL` call, this forms the entire path for the subprogram to be called.

Note

Parameter

When calling an external program, none of these parameters can be transferred to it.

Syntax

```
EXTCALL("<path/><program name>")
```

Meaning

EXTCALL:	Command for calling an external subprogram.	
"<path/><program name>":	Constant/variable of type STRING	
	<path>:	Absolute or relative path data (optional)
	<program name>:	<p>The program name is specified without prefix "_N".</p> <p>The file extension ("MPF", "SPF") can be attached to program names using the "_" or "." character (optional).</p> <p>Example:</p> <p>"SHAFT"</p> <p>"SHAFT_SPF"</p> <p>"SHAFT.SPF"</p>

Path specification: Short designations

The following short designations can be used to specify the path:

- User CF card: **"CF_CARD:"**
- USB drive (operator panel front): **"USB:"**

Example

The "MAIN.MPF" main program is stored in NC memory and is selected for execution.

Subprogram "SP_1"

The external subprogram "SP_1.SPF " or "SP_1.MPF " is on the user CF card in the "/ WKS.DIR /WST1.WPD" directory.

The path for the external program directory is set with:

SD42700 \$SC_EXT_PROG_PATH = CF_CARD:WKS.DIR/WST1.WPD

Note

Specification of the path for the call of the external subprogram:

- Without the default setting: "CF_CARD:WKS.DIR/WST1.WPD/SP_1"
 - With the default setting: "SP_1"
-

Subprogram "SP_2"

The external subprogram "SP_2.SPF " or "SP_2.MPF " is in the WKS.DIR /WST1.WPD directory of the USB drive. The default path setting to the external program directory is used for the path of subprogram "SP_1" and is also not rewritten in the main program. Therefore, the complete path needs to be specified when subprogram "SP_2" is called.

Main program "MAIN"

Program code
N010 PROC MAIN
N020 ...
N030 EXTCALL("SP_1")
N030 EXTCALL("USB:WKS.DIR/WST1.WPD/SP_2")
N050 ...
N060 M30

Additional information

EXTCALL call with absolute path name

If the subprogram exists under the specified path, it is executed with the `EXTCALL` call. If the subprogram does not exist under the specified path, the program execution is aborted with the `EXTCALL` call.

EXTCALL call with relative path name / without path name

In the event of an `EXTCALL` call with a relative path name or without a path name, the available program memories are searched as follows:

1. If a path name is preset in SD42700 \$SC_EXT_PROG_PATH, the data specified in the `EXTCALL` call (program name or with relative path name) is searched for first, starting from this path. The absolute path is obtained from linking the following characters:
 - Default path specification in SD42700 \$SC_EXT_PROG_PATH
 - Separator "/"
 - Path specification and subprogram name in the `EXTCALL` command
2. If the subprogram was not found under 1., the directories of the user memory are searched.

The search ends when the subprogram is found for the first time. If the subprogram is not found, the program execution is aborted with the `EXTCALL` call.

Adjustable reload memory (FIFO buffer)

A reload memory is required for the execution of an external subprogram. The size of the reload memory is preset (see MD18360 MM_EXT_PROG_BUFFER_SIZE).

Note

Subprograms with jump commands

For external subprograms that contain jump commands (`GOTO`, `GOTOB`, `CASE`, `FOR`, `LOOP`, `WHILE`, `REPEAT`, `IF`, `ELSE`, `ENDIF` etc.) the jump destinations must lie within the post loading memory.

Note

ShopMill/ShopTurn programs

The contour descriptions added at the file end mean the ShopMill and ShopTurn programs must be stored completely in the read-only memory.

A separate reload memory is required for external subprograms executed in parallel.

Reset / end of program / POWER ON

Reset and POWER ON cause external subprogram calls to be interrupted and the associated load memory to be deleted.

A program selected for "Execution from external source" remains selected for "Execution from external source" after a reset / end of program. The behavior does not differ from internally selected programs, assuming that the external program memory is still available.

References

Further information on "Execution from external source" can be found in:

Function Manual, Basic Functions, Mode Group, Channel, Program Operation, Reset Behavior (K1)

2.25 Macro technique (DEFINE ... AS)

NOTICE

Macros increase the complexity of programming

Macros can significantly alter the control's programming language. Macro technology may only be used with great care.

A macro is a sequence of individual statements which have together been assigned a name of their own. When a macro is called during a program run, the statements programmed under the program name are executed one after the other.

According to the range of validity (in other words, the range in which the macro definition is active), there are the following macro categories:

- **Local macros**
Local macros are macros that are defined at the beginning of an NC program, which at the time of execution is not the main program. They are created when the NC program is called, and deleted with an end of program reset – or the next time that the control system powers up. Local macros can only be accessed within the NC program in which they are defined.
- **Program-global macros**
Program-global macros are macros that are defined at the beginning of an NC program, which is used as main program. They are created when the NC program is called, and deleted with an end of program reset – or the next time that the control system powers up. Program-global macros can be accessed in the main program and in all subprograms.

Note

Availability of program-global macros

Program-global macros defined in the main program are only available in subprograms if the following machine data is set:

MD11120 \$MN_LUD_EXTENDED_SCOPE = 1

If MD11120 = 0, the program-global macros defined in the main program will only be available in the main program.

- **Global macros**
Global macros are NC or channel-global macros, which are defined in a definition file (macro file) – and are kept even after an end of program reset or the next time that the control system powers up. Global macros can be called in any main program or subprogram and executed.

Note

In order to use the macros of an **external** macro file in the NC program, the macro file must be downloaded to the NC.

Macros must have been defined before they can be used. The following rules must be observed in this context:

- Any identifier, G, M, H functions and L subprogram names can be defined in a macro.
- The macro can be defined at the beginning of the program or in a dedicated definition file (macro file).
- Local and program-global macros are defined at the beginning of the program.
- Global macros must be defined in a macro file, e.g. _N_DEF_DIR/_N_UMAC_DEF.
- G command macros can only be defined as global macros.
- H and L functions can be programmed with 2 digits.
- M and G commands can be programmed with 3 digits.

Note

Keywords and reserved names may not be overwritten with macros.

Syntax

Macro definition:

```
DEFINE <Macro_name> AS <Operation_1> <Operation_2> ...
```

Call in the NC program:

```
<Macro_name>
```

Meaning

DEFINE ... AS :	Keyword combination to define a macro
<Macro_name>:	Macro name Only identifiers are permissible as macro names. The macro is called from the NC program with the macro name.
<Operation_1>:	First programming instruction in the macro
<Operation_2>:	Second programming instruction in the macro

Supplementary conditions

Nesting

Nesting of macros is not possible.

Examples

Example 1: Macro definition at the beginning of the program

Program code	Comment
DEFINE LINE AS G1 G94 F300	; Macro definition

Program code	Comment
...	
N70 LINE X10 Y20	; Macro call
...	

Example 2: Macro definitions in a macro file

Program code	Comment
DEFINE M6 AS L6	; A subprogram is called at tool change to handle the necessary data transfer. The actual M function is output in the subprogram (e.g. M106).
DEFINE G81 AS DRILL(81)	; Emulation of the DIN-G command.
DEFINE G33 AS M333 G333	; During thread cutting, synchronization is requested with the PLC. The original G command G33 was renamed to G333 by machine data so that the programming is identical for the user.

Example 3: External macro file

The macro file must be downloaded into the NC after reading the external macro file into the control. Only then can macros be used in the NC program.

Program code	Comment
%_N_UMAC_DEF	
;\$PATH=/_N_DEF_DIR	; Customer-specific macros
DEFINE PI AS 3.14	
DEFINE TC1 AS M3 S1000	
DEFINE M13 AS M3 M7	; Spindle clockwise, coolant on
DEFINE M14 AS M4 M7	; Spindle counter-clockwise, coolant on
DEFINE M15 AS M5 M9	; Spindle stop, coolant off
DEFINE M6 AS L6	; Call tool change program
DEFINE G80 AS MCALL	; Deselect drilling cycle
M30	

File and Program Management

3.1 Program memory

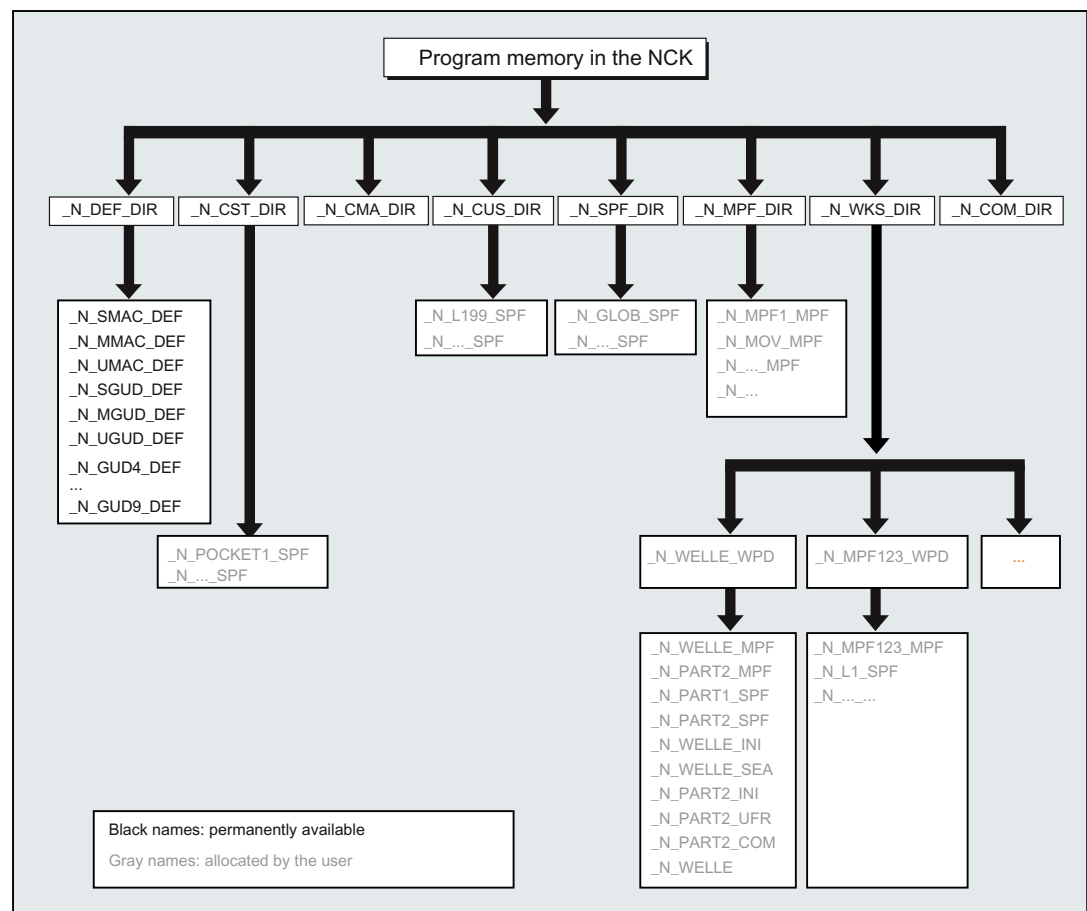

3.1.1 NC program memory

Files and programs (e.g. main programs and subprograms, macro definitions) are saved in the non-volatile program memory (→ passive file system).

References:

Function Manual, Extended Functions; Memory Configuration (S7)

A number of file types are also stored here temporarily; these can be transferred to the work memory as required (e.g. for initialization purposes when machining a specific workpiece).

Standard directories

The following standard directories are available:

Directory	Content
_N_DEF_DIR	Data modules and macro modules
_N_CST_DIR	Standard cycles
_N_CMA_DIR	Manufacturer cycles
_N_CUS_DIR	User cycles
_N_WKS_DIR	Workpieces
_N_SPF_DIR	Global subprograms
_N_MPF_DIR	Main programs
_N_COM_DIR	Comments

File types

The following file types can be stored in the main memory:

File type	Description
<name>_MPF	Main program
<name>_SPF	Subprogram
<name>_TEA	Machine data
<name>_SEA	Setting data
<name>_TOA	Tool offsets
<name>_UFR	Zero offsets/frames
<name>_INI	Initialization files
<name>_GUD	Global user data
<name>_RPA	R-parameters
<name>_COM	Comment
<name>_DEF	Definitions for global user data and macros

Workpiece main directory (_N_WKS_DIR)

The workpiece main directory exists in the standard setup of the program memory under the name _N_WKS_DIR. The workpiece main directory contains all the workpiece directories for the workpieces that you have programmed.

Workpiece directories (..._WPD)

A workpiece directory contains all files required for machining a workpiece. These can be main programs, subprograms, any initialization programs and comment files.

The first time a part program is started, initialization programs are executed once, depending on the selected program (in accordance with machine data MD11280 \$MN_WPD_INI_MODE).

Example:

The workpiece directory _N_SHAFT_WPD, created for SHAFT workpiece contains the following files:

File	Description
_N_SHAFT_MPF	Main program
_N_PART2_MPF	Main program
_N_PART1_SPF	Subprogram
_N_PART2_SPF	Subprogram
_N_SHAFT_INI	General initialization program for the data of the workpiece
_N_SHAFT_SEA	Setting data initialization program
_N_PART2_INI	General initialization program for the data for the Part 2 program
_N_PART2_UFR	Initialization program for the frame data for the Part 2 program
_N_SHAFT_COM	Comment file

Data can also be stored in the workpiece directory which is not directly required by the NC for the machining. In addition to ASCII files, this can be binary files, such as images in JPG format or descriptions in PDF format. In order that these can be interpreted as binary files by the NC, the file extensions must be known in the NC (setting during commissioning via MD17000 \$MN_EXTENSIONS_OF_BIN_FILES; the following file extensions are preset in the basic setting: JPG, GIF, PNG, BMP, PDF, ICO, HTM).

Select workpiece for machining

A workpiece directory can be selected for execution in a channel. If a main program with the **same name** or only a single main program (_MPF) is stored in this directory, this is automatically selected for execution.

References:

Operating Manual

3.1.2 External program memory

In addition to the passive file system in the NC, external program memories can also be available at the machine (e.g. on the local drive or on a network drive).

Using the functions "Execute from external" or "EES (Execution from External Storage)" part programs can be **directly** executed from external program memories.

Reference:

Function Manual Basic Functions; K1: Mode Group, Channel, Program Operation, Reset Response

Global part program memory (GDIR)

When declaring the drives, one of the drives can be designated the global part program memory (GDIR).

References:

Operating Manual: section: "Manage programs" > "Setting up drives"

3.1 Program memory

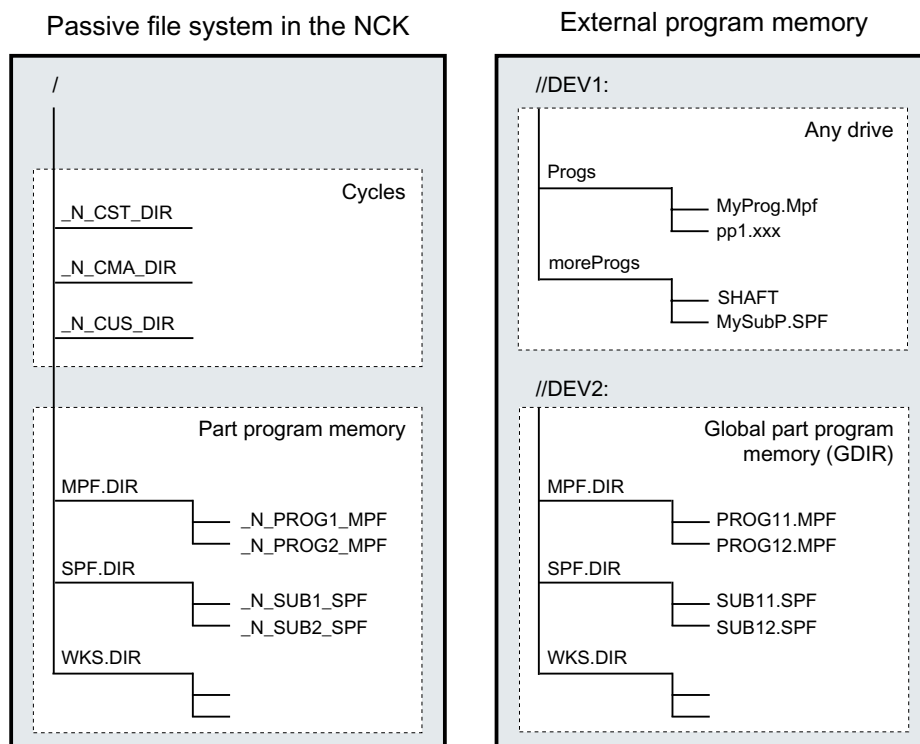

The system automatically creates the MPF.DIR, SPF.DIR and WKS.DIR directories on the drive. These three directories form the GDIR.

The GDIR only plays a role for the EES function. Depending on the drive configuration, the GDIR replaces or extends the NC part program memory. The creation of a GDIR is, however, not essential for EES operation.

The directories and files of the GDIR can be addressed in the part program in the same way as in the passive file system. This permits a compatible transfer of an NC program with path details from the passive file system to the GDIR. The directory SPF.DIR of the GDIR is contained in the search path for subprograms.

Program organization

The program organization on external program memories is shown in the following diagram:

Case-insensitive file systems

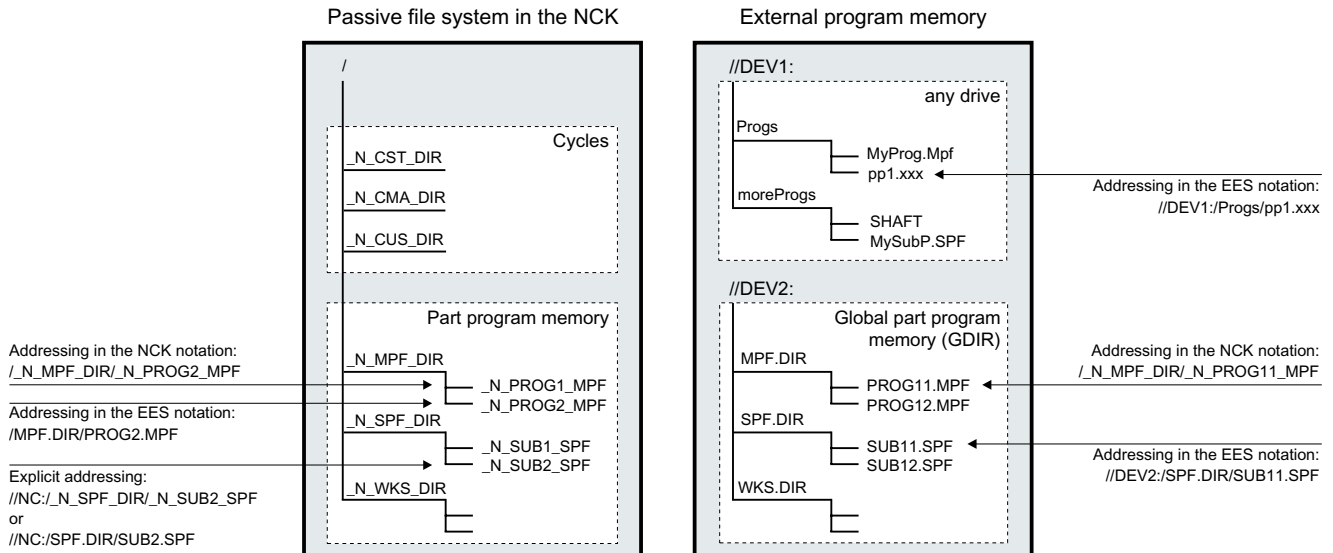

Note

To avoid problems with case-sensitivity for the file addressing (see "Addressing program memory files (Page 217)"), **case-insensitive** file systems should be used as external program memory.

3.1.3 Addressing program memory files

A file in the program memory, which is addressed with a file handling command (e.g. WRITE, DELETE, READ, ISFILE, FILEDATE, FILETIME, FILESIZE, FILESTAT, FILEINFO), is referenced with an absolute path plus file names or only with the file names. In the second case, the path of the selected program is used as file path.

Addressing in the NC/EES notation

Addressing files of the passive file system

Files of the passive file system are generally addressed in the **NC notation** (directory and file names begin with the domain identifier "`_N_`", "`_`" is the separator for the file identifier) without specifying the drive name. An addressing in **EES notation** (without domain identification "`_N_`", separator for the directory/file extension is "`.`") is, however, also permitted.

Example:

- NC notation: `"/_N_SPF_DIR/_N_SUB1_SPF"`
- EES notation: `"/SPF.DIR/SUB1.SPF"`

Note

The addressing schemes for files of the passive file system in EES notation are converted internally into NC notation in accordance with the following rules:

- Directory and file names are extended with the domain identification "`_N_`".
- If the fourth-last character in the directory or file name is a period ("`.`"), it will be converted into an underscore ("`_`").

The passive file system can also be explicitly addressed using the predefined drive names `"//NC:"`.

3.1 Program memory

Example:

- NC notation: "//NC:/_N_SPF_DIR/_N_SUB1_SPF"
- EES notation: "//NC:/SPF.DIR/SUB1.SPF"

Addressing files of an external program memory

Files of an external program memory not recorded as GDIR must be addressed in EES notation. The drive name (e.g. "//DEV1:") must be specified at the start of the addressing path. All symbolic device names configured in /user/sinumerik/hmi/cfg/logdrive.ini are permissible.

Example:

- EES notation: "//DEV1:/MyProgDir/pp1.xxx"
- NC notation: Not permissible

Addressing files of the global part program memory (GDIR)

When addressing files of the GDIR, in addition to specifying the path in the EES notation, it is also permissible to specify the path in the NC notation.

Example:

- EES notation: "//DEV2:/MPF.DIR/PROG11.MPF"
- NC notation: "/_N_MPF_DIR/_N_PROG11_MPF"

Note

The addressing schemes for files of the GDIR in NC notation are converted internally into EES notation in accordance with the following rules:

- The domain identification "_N_" in directory and file names is removed.
 - If the fourth-last character in the directory or file name is an underscore ("_"), it will be converted into a period (".").
-

Rules for the path specification

A complete path specification consists of drive name, directory path and file name.

Drive name

The following rules govern the specification of the drive name:

- All symbolic device names configured in /user/sinumerik/hmi/cfg/logdrive.ini are permissible.
- The character "/" is at the beginning, followed by at least one letter or one digit.
- The following characters can be any combination of letters, digits, "_" and spaces.
- The name is ended with a letter or a digit, followed by a ":".
- Other special characters are not permitted.

Note

The drive name "//NC:" is predefined for the passive file system.

Examples:

- External program memory:
 - //Drive1:
 - //Drive_1:
 - //Drive 1:
 - //A B:
 - //1 B C 2:

Directory path

The following rules govern the specification of the directory path:

- A "/" is located at the start and end of the directory path and as separator for the individual path sections.

Note

A double slash ("/") within the directory path is **not** permitted!

- Directory names:
 - Directory names must begin with a letter or a digit. Only for addressing in the NC notation do directory names begin with the domain identification "_N_".
 - The following characters can be any combination of letters, digits and "_".

Note

Spaces in directory names are also permitted for external program memories. This is not true, however, when the external program memory is created as global part program memory (GDIR).

- Other special characters are not permitted.
- Directory extensions:
 - Directory extensions must consist of three letters/digits.
 - They are separated with "_" (NC notation) or "." (EES notation) from the directory name.

Note

The passive file system has only the directory extensions _DIR and _WPD.

3.1 Program memory

Examples:

- Passive file system or GDIR:
 - NC notation: `_N_WKS_DIR/_N_MYNCPROGS_WPD/...`
 - EES notation: `WKS.DIR/MYPROGS.WPD/...`
- External program memory:
 - `/abc`
 - `/ab_c.def`
 - `/ab c1.def`
 - `/a b c .d11`
 - `/abc.def/ghi.klm`

File name

The following rules apply to the file names:

- Only for addressing in NC notation do file names begin with the domain identification "`_N_`".
- The next two characters should be either two letters or an underscore followed by a letter.

Note

If this condition is satisfied, then an NC program can be called as subprogram from another program just by specifying the program name. However, if the program name starts with digits, the subprogram call is then only possible via the CALL statement.

- The following characters can be any combination of letters, digits and "`_`".
- File extension:
 - The file extension must consist of three letters/digits.

Note

Permitted file extensions in the passive file system, see "NC program memory (Page 213)".

- They are separated with "`_`" (NC notation) or "`.`" (EES notation) from the file names.

Examples:

- Passive file system or GDIR:
 - NC notation: `_N_SUB1_SPF`
 - EES notation: `SUB1.SPF`
- External program memory:
 - `Part 1`
 - `_Part1`
 - `Part_1.spf`
 - `Part1.mpf`

DIN subprogram name

The following rules apply to DIN subprogram names:

- The first character must be the letter "L".
- The following characters are digits (at least one).
- File extension:
 - The file extension must consist of three letters.
 - They are separated with "_" (NC notation) or "." (EES notation) from the file names.

Examples:

- L123
- L1_SPF (NC notation) or L1.SPF (EES notation)

Maximum path length

Maximum 128 bytes are available for specifying the drive name and the directory path; the maximum length of the file name is 31 bytes. The maximum length of the complete path is 159 bytes.

3.1.4 Search path for subprogram call

For subprogram calls without path data, the absolute path is determined by processing a fixed search path.

A search is then made in the program memory in the following sequence:

	Directory	Description
1	current directory / <i>name</i>	The current directory is the directory in which the program is selected. This can be: <ul style="list-style-type: none"> • A workpiece directory or the standard directory <code>_N_MPF_DIR</code> in the NC part program memory or global part program memory or <ul style="list-style-type: none"> • Any directory of an external program memory
2	current directory / <i>name_SPF</i>	
3	current directory / <i>name_MPF</i>	
4	a //NC:/_N_SPF_DIR / <i>name_SPF</i>	Subprogram directory in the NC part program memory
	b //DEV2:/_N_SPF_DIR / <i>name_SPF</i> ¹⁾	Subprogram directory in the global part program memory Note: This search step is not executed if a global part program memory has not been created, or the program is selected in the NC part program memory.

3.1 Program memory

	Directory	Description
5	Search path extension programmed with <code>CALLPATH</code> (see "Extend search path for subprogram calls (CALLPATH) (Page 200)"). Note: This search step is not executed if <code>CALLPATH</code> has not been programmed.	
6	<code>/_N_CUS_DIR / name_SPF</code>	User cycle directory
7	<code>/_N_CMA_DIR / name_SPF</code>	Manufacturer cycle directory
8	<code>/_N_CST_DIR / name_SPF</code>	Standard cycle directory

¹⁾ `//DEV2:` For example represents the drive on which the global part program memory has been created.

The following rules apply for the search:

- The search path is run through for each individual subprogram call, this means that it is irrelevant where the higher-level program is located.
- Depending on the directory, different file types are taken into account.
- A search is made in a directory, and not in lower-level, i.e. nested directories.

3.1.5 Interrogating the path and file name

The following system variables, which can be read in the part program, are available to interrogate the path and file name of an NC program:

System variable	Type	Meaning
<code>\$P_STACK</code>	INT	Supplies the program level in which the current NC program is executed.
<code>\$P_PATH[<n>]</code>	STRING	Supplies the path of the NC program, which is processed at the program level selected using field index <code><n></code> . Examples: <code>\$P_PATH[0]</code> supplies the path for the main program, e.g. <code>"/_N_WKS_DIR/_N_WELLE_WPD/"</code> . <code>\$P_PATH[\$P_STACK - 1]</code> supplies the path of the calling program. If the path refers to an NC program, which is saved in the passive file system of the NC or in the global part program memory (GDIR), then the path is supplied in the NC notation. If the path refers to an NC program, which is executed by an external program memory other than the global part program memory then <code>\$P_PATH</code> supplies the path in the EES notation.
<code>\$P_PROG[<n>]</code>	STRING	Supplies the name of the NC program, which is processed at the program level selected using field index <code><n></code> . If the NC program is saved in the passive file system of the NC or in the global part program memory, then the program name is supplied in the NC notation. If the NC program is executed by an external drive other than the global part program memory, then <code>\$P_PROG</code> supplies the name in the EES notation.

System variable	Type	Meaning
\$P_PROGPATH	STRING	Supplies the path of the NC program that is presently being processed. Calling \$P_PROGPATH is identical to \$P_PATH[\$P_STACK].
\$P_IS_EES_PATH[<n>]	BOOL	Interrogates whether the path supplied by \$P_PATH[<n>] or the program name supplied by \$P_PROG[<n>] corresponds to the NC notation or the EES notation.
		<div> <div>= FALSE</div> <div> <p>\$P_PATH[<n>] and \$P_PROG[<n>] supply a NC notation. This means that each identifier has the prefix "_N_". The separator for the file identifier is ".".</p> <p>Examples:</p> <ul style="list-style-type: none"> Path in the NC notation: "/_N_WKS_DIR/_N_MYWPD_WPD/" Program name in the NC notation: "_N_MYPROG_MPF" <p>A path in the NC notation can refer to the passive file system in the NC as well as also the global part program memory.</p> </div> </div>
		<div> <div>= TRUE</div> <div> <p>\$P_PATH[<n>] and \$P_PROG[<n>] supply an EES notation. This means that the identifiers do not have the "_N_" prefix. The separator for the file identifier is ".".</p> <p>Examples:</p> <ul style="list-style-type: none"> Path in the EES notation: "//DEV1:/WKS.DIR/MYWPD.WPD/" Program name in the EES notation: "MYPROG.MPF" </div> </div>

<n>: Index <n> defines the program level, from which the path information should be read (value range: 0 ... 17)

Note

In the EES mode, outside the global part program memory (GDIR), system variables \$P_PROG, \$P_PATH and \$P_PROGPATH path names in the EES notation. For the EES mode, user programs that evaluate and process these path names must be extended so that they can also process pathnames in the EES notation.

3.2 Working memory (CHANDATA, COMPLETE, INITIAL)

Function

The working memory contains the current system and user data with which the control is operated (active file system), e.g.:

- Active machine data
- Tool offset data
- Zero offsets
- ...

Initialization programs

These are programs with which the working memory data is initialized. The following file types can be used for this:

File type	Description
name_TEA	Machine data
name_SEA	Setting data
name_TOA	Tool offsets
name_UFR	Zero offsets/frames
name_INI	Initialization files
name_GUD	Global user data
name_RPA	R-parameters

Data areas

The data can be organized in different areas in which they are to apply. For example, a control can have several channels or, as is commonly the case, several axes at its disposal.

There are:

Identifier	Data areas
NC	NC-specific data
CH<n>	Channel-specific data (<n> specifies the channel name)
AX<n>	Axis-specific data (<n> specifies the number of the machine axis)
TO	Tool data
COMPLETE	All data

Create initialization program at an external PC

The data area identifier and the data type identifier can be used to determine the areas which are to be treated as a unit when the data is saved:

_N_AX5_TEA_INI	Machine data for axis 5
_N_CH2_UFR_INI	Frames of channel 2
_N_COMPLETE_TEA_INI	All machine data

When the control is started up initially, a set of data is automatically loaded to ensure proper operation of the control.

Procedure for multi-channel controls (CHANDATA)

CHANDATA(<channel number>) for several channels is only permissible in the file _N_INITIAL_INI. This is the commissioning file with which all data of the control is initialized.

Program code	Comment
%_N_INITIAL_INI	
CHANDATA(1)	
	; Machine axis assignment, channel 1:
\$MC_AXCONF_MACHAX_USED[0]=1	
\$MC_AXCONF_MACHAX_USED[1]=2	
\$MC_AXCONF_MACHAX_USED[2]=3	
CHANDATA(2)	
	; Machine axis assignment, channel 2:
\$MC_AXCONF_MACHAX_USED[0]=4	
\$MC_AXCONF_MACHAX_USED[1]=5	
CHANDATA(1)	
	; Axial machine data:
	; Exact stop window coarse:
\$MA_STOP_LIMIT_COARSE[AX1]=0.2	; Axis 1
\$MA_STOP_LIMIT_COARSE[AX2]=0.2	; Axis 2
	; Exact stop window fine:
\$MA_STOP_LIMIT_FINE[AX1]=0.01	; Axis 1
\$MA_STOP_LIMIT_FINE[AX1]=0.01	; Axis 2

NOTICE

CHANDATA statement

In the part program, the CHANDATA statement may only be set for that channel in which the NC program is executed. This means the statement can be used to protect NC programs so that they are not executed in the wrong channel.

Program processing is aborted if an error occurs.

Note

INI files in job lists do not contain any CHANDATA statements.

Save initialization program (COMPLETE, INITIAL)

The files of the working memory can be saved on an external PC and then read in again from there.

- The files are saved with COMPLETE.
- INITIAL is used to create an INI file (_N_INITIAL_INI) over all areas.

Read-in initialization program

NOTICE
Data loss If the file is read-in with the name "INITIAL_INI", then all data that is not supplied in the file is initialized using standard data. Only machine data is an exception. This means that setting data, tool data, ZO, GUD values, ... are supplied with standard data (normally "ZERO").

For example, the file COMPLETE_TEA_INI is suitable for reading-in individual machine data. The control only expects machine data in this file. This is the reason that the other data areas remain unaffected in this case.

Loading initialization programs

The INI programs can also be selected and called as part programs if they only use data of one channel. This means that it is also possible to initialize program-controlled data.

Protection zones

4.1 Defining protection zones (CPROTDEF, NPROTDEF)

Protection zones, which protect machine elements against collisions, are defined in the part program in blocks. These contain the following elements:

1. Definition of the machining plane
Before the actual protection zone definition, the machining plane must be selected, to which the contour description of the protection zone refers.
2. Start of the definition
Depending on the particular NC command, either a channel-specific or machine-specific protection zone is created.
3. Contour description of the protection zone
The contour of a protection zone is defined with traversing motion. These are not executed and have no connection to previous or subsequent geometry descriptions. They only define the protection zone.
4. End of definition

Syntax

```
DEF INT <Var>
G17/G18/G19
CPROTDEF/NPROTDEF (<n>,<t>,<AppLim>,<AppPlus>,<AppMinus>)
G0/G1/... X/Y/Z...
...
EXECUTE (<Var>)
```

Meaning

DEF INT <Var>:	Definition of a local help variable, of the INTEGER data type	
<Var>:	Name of the Help variable	
G17/G18/G19:	Machining plane Note: It is not permissible to change the machining plane before the end of the definition. Programming the applicate is not permitted between start and end of the definition.	
CPROTDEF ():	Predefined procedure to define a channel -specific protection zone

The last point in the contour description must always coincide with the first point of the contour description.</p> <p>The valid protection zone is the zone left of the contour:</p> <ul style="list-style-type: none"> • Internal protection zone The contour of an internal protection zone must be described in the counterclockwise direction. • External protection zones (permitted only for workpiece-related protection zones) The contour for an external protection zone must be described in the clockwise direction. <p>The following contour elements are permissible:</p> <ul style="list-style-type: none"> • G0, G1 for straight contour elements • G2 for circle segments in the clockwise direction Permissible only for workpiece-related protection zones. Not permissible for tool-related protection zones because they must be convex. • G3 for circular segments in the counter-clockwise direction <p>Note: A protection zone cannot be described by a complete circle. A complete circle must be divided into two semicircles.</p> <p>Note: The sequence G2 → G3 or G3 → G2 is not permissible! A short G1 block must be inserted between the two circular blocks.</p>	
EXECUTE(<Var>):	<p>Predefined procedure that marks the end of the definition</p> <p>A switch is made back to normal program processing with EXECUTE.</p>	

Example

See example under "Activating/deactivating protection zones (CPROT, NPROT) (Page 231)".

Additional information

Machine-specific protection zones

A machine-specific protection zone or its contour is defined using the geometry axis, i.e. referenced to the basic coordinate system (BCS) of a channel. In order that correct protection-zone monitoring can take place in all channels in which the machine-specific protection zone is active, the basic coordinate system (BCS) of all of the channels involved must be identical:

- position of the coordinate origin referred to the machine zero
- Orientation of the coordinate axes

Reference point for contour description

- Tool-related protection zones
Coordinates for **tool**-related protection zones must be specified as absolute values referred to the **tool holder reference point F**.
- Workpiece-related protection zones
Coordinates for **workpiece**-related protection zones must be specified as absolute values referred to the zero point of the **basic coordinate system (BCS)**.

Protection zones symmetrical around the center of rotation

For protection zones symmetrical around the axis of rotation (e.g. spindle chuck), you must describe the complete contour and not only the contour up to the center of rotation.

Tool-related protection zones

Tool-related protection zones must always be convex. If a concave protected zone is desired, this should be subdivided into several convex protection zones.

- ① Convex protection zones
- ② Concave protection zones (**not permissible!**)
- F Toolholder reference point

4.1 Defining protection zones (CPROTDEF, NPROTDEF)

General conditions

During the definition of a protection zone, the following functions must not be active or used:

- Tool radius compensation (cutter radius compensation, tool nose radius compensation)
- Transformation
- Reference point approach (G74)
- Fixed point approach (G75)
- Dwell time (G4)
- Block search stop (STOPRE)
- End of program (M17, M30)
- M functions: M0, M1, M2

4.2 Activating/deactivating protection zones (CPROT, NPROT)

Protection zones previously defined in the part program can be activated at any time – or can be preactivated for subsequent activation by the PLC user program. Active protection zones can be deactivated at any time.

When activating or preactivating, it is also possible to relatively shift the reference point of the protection zone.

Note

A protection zone is only taken into account after the referencing of all geometry axes of the channel in which it has been activated.

Note

Monitoring protection zones

If a tool-related protection area is not active, the tool path is checked against the workpiece-related protection zones.

If no workpiece-oriented protection zone is active, then there is no protection zone monitoring.

Syntax

```
CPROT (<n>, <Status>, <XMov>, <YMov>, <ZMov>)
NPROT (<n>, <Status>, <XMov>, <YMov>, <ZMov>)
```

Meaning

CProt:	Predefined procedure to activate a channel -specific protection zone			
NProt:	Predefined procedure to activate a machine -specific protection zone			
<n>:	Number of the protection zone			
	Data type:	INT		
<Status>:	The channel-specific activation status is set using this parameter			
	Data type:	INT		
	Value:	0	Deactivate protection zone	
		1	Preactivate protection zone	
		2	Activate protection zone	
3		Preactivate protection zone with conditional stop		
<XMov>, <YMov>, <ZMov>:	Additive offset values in the X/Y/Z direction The offset can take place in 1, 2, or 3 dimensions. The offset values refer to: <ul style="list-style-type: none">• The machine zero for a workpiece-related protection zone• The tool carrier reference point F for a tool-specific protection zone			
	Data type:	REAL		

Example

Possible collision of a milling cutter with the measuring probe is to be monitored on a milling machine. The position of the measuring probe is to be defined by an offset when the function is activated.

The following protection zones are defined for this:

- A machine-specific and a workpiece-related protection zone for both the measuring probe holder (n-PZ1) and the measuring probe itself (n-PZ2).
- A channel-specific and a tool-related protection zone for the milling cutter holder (c-PZ1), the cutter shank (c-PZ2) and the milling cutter itself (c-PZ3).

The orientation of all protection zones is in the Z direction.

The position of the reference point of the measuring probe on activation of the function must be X = -120, Y = 60 and Z = 80.

① Name for the protection zone of the probe

F Toolholder reference point

Further information

Activation status after the control powers up

A protection zone can already be active after the control system powers up and the axes have been referenced. This is the case if, for the protection zone, the following system variable is set to TRUE:

- \$SN_PA_ACTIV_IMMED[<n>] (for machine-specific protection zone) or
- \$SC_PA_ACTIV_IMMED[<n>] (for channel-specific protection zone)
Index "<n>" corresponds to the number of the protection zone: 0 = 1. Protection zone

The protection zone is activated with status = 2 – and without offset.

4.2 Activating/deactivating protection zones (CPROT, NPROT)

Multiple activation of a protection zone

A machine-specific protection zone can be active simultaneously in several channels (e.g. protection zone of a tailstock where there are two opposite sides). The protection zones are only monitored if all geometry axes have been referenced.

A protection zone cannot be activated simultaneously with different offsets in a single channel.

Protection zone monitoring for active tool radius compensation

For active tool radius compensation, a functioning protection zone monitoring is only possible if the plane of the tool radius compensation is identical to the plane of the protection zone definitions.

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

Function

In the workpiece coordinate system (WCS), the CALCPOSI function checks whether, starting from the starting position, the **geometry axes** can be traversed a specified distance without violating active limits. For the case that the distance cannot be fully traversed because of limits, a positive, decimal-coded status value and the maximum possible traversing distance are returned.

Definition

```
INT CALCPOSI (VAR REAL[3] <Start>, VAR REAL[3] <Dist>, VAR REAL[5]
<Limit>, VAR REAL[3] <MaxDist>, BOOL <MeasSys>, INT <TestLim>)
```

Syntax

```
<Status> = CALCPOSI (VAR <Start>, VAR <Dist>, VAR <Limit>, VAR
<MaxDist>, <MeasSys>, <TestLim>)
```

Meaning

CALCPOSI (...):	Predefined function for testing limit violations regarding the geometry axes	
	Preprocessing stop:	No
	Alone in the block:	Yes

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

<status>: (Part 1)	Function return value. Negative values indicate error states.	
	Data type:	INT
	Value range:	$-8 \leq x \leq 100000$
	Value:	0 The distance can be traversed completely.
		-1 At least one component is negative in <Limit>.
		-2 Error in a transformation calculation. Example: The traversing distance passes through a singularity so that the axis positions cannot be defined.
		-3 The specified traversing distance <Dist> and the maximum possible traversing distance <MaxDist> are linearly dependent. Note Can only occur in conjunction with <TestLim>, bit 4 == 1.
		-4 The projection of the traversing direction contained in <Dist> on to the limitation surface is the zero vector, or the traversing direction is perpendicular to the violated limitation surface. Note Can only occur in conjunction with <TestLim>, bit 5 == 1.
		-5 In <TestLim>, bit 4 == 1 AND bit 5 == 1
		-6 At least one machine axis that has to be considered for checking the traversing limits has not been referenced.
		-7 Collision avoidance function: Invalid definition of the kinematic chain or the protection zones.
		-8 Collision avoidance function: This command cannot be executed because of insufficient memory.
<status>: (Part 2)	Units digit	
	Note If several limits are violated simultaneously, the limit with the greatest restriction on the specified traversing distance is signaled.	
	Value:	1 Software limit switches are limiting the traversing distance
		2 Working area limits are limiting the traversing distance
		3 Protection zones are limiting the traversing distance
		4 Collision avoidance function: Protection zones are limiting the traversing path
	Tens digit	
	Value:	1x The initial value violates the limit
		2x The specified straight line violates the limit. This value is returned even if the end point does not violate any limit itself, but the path from the starting point to the end point would cause a limit value to be violated (e.g. by passing through a protection zone, curved software limit switches in the WCS for non-linear transformations, e.g. transmit).

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

<status>: (Part 3)	Hundreds digit		
	Value:	1xx	AND units digit == 1 or 2: The positive limit value has been violated.
			AND units digit == 3 ¹⁾ : An NC-specific protection zone has been violated.
		2xx	AND units digit == 1 or 2: The negative limit value has been violated.
			AND units digit == 3 ¹⁾ : A channel-specific protection zone is violated.
<status>: (Part 4)	Thousands digit		
	Value:	1xxx	AND units digit == 1 or 2: Factor with which the axis number is multiplied that violates the limit. Numbering of the axes begins with 1. Reference: <ul style="list-style-type: none"> • Software limit switches: Machine axes • Working area limitation: Geometry axes AND units digit == 3 ¹⁾ : Factor with which the number of the violated protection zone is multiplied.
<status>: (Part 5)	Hundred thousands digit		
	Value:	0xxxxx	Hundred thousands digit == 0: <Dist> remains unchanged
		1xxxxx	A direction vector is returned in <Dist>, which defines the further motion direction on the limitation surface. Can only occur with the following supplementary conditions: <ul style="list-style-type: none"> • Software limit switch or working area limit violated (not in the starting point) • A transformation is not active • <TestID>, bit 4 or bit 5 == 1
<Start>:	Reference to a vector with the start positions: <ul style="list-style-type: none"> • <Start> [0]: 1st geometry axis • <Start> [1]: 2nd geometry axis • <Start> [2]: 3rd geometry axis 		
	Parameter type:		Input
	Data type:		VAR REAL [3]
	Value range:		-max. REAL value ≤ x[<n>] ≤ +max. REAL value

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

<Dist>:	Reference to a vector.	
	Input: Incremental traversing distance <ul style="list-style-type: none"> • <Dist> [0]: 1st geometry axis • <Dist> [1]: 2nd geometry axis • <Dist> [2]: 3rd geometry axis 	
	Output (only for set hundred thousands digit in <Status>):	
	<Dist> contains a unit vector v as output value which defines the further traversing direction in the WCS.	
	Case 1: Formation of vector v for <TestID>, bit 4 == 1 The input vectors <Dist> and <MaxDist> span the motion plane. This plane is cut by the violated limitation surface. The intersecting line of the two planes defines the direction of vector v . The orientation (sign) is selected so that the angle between the input vector <MaxDist> and v is not greater than 90 degrees.	
	Case 2: Formation of vector v for <TestID>, bit 5 == 1 Vector v is the unit vector in the projection direction of the traversing vector contained in <Dist> on the limitation surface. If the projection of the traversing vector on the limitation surface is the zero vector, an error is returned.	
	Parameter type:	Input/output
<Limit>:	Data type:	VAR REAL [3]
	Value range:	-max. REAL value ≤ x[n] ≤ +max. REAL value
	Reference to an array of length 5. <ul style="list-style-type: none"> • <Limit> [0 - 2]: Minimum clearance of the geometry axes to the limits: <ul style="list-style-type: none"> – <Limit> [0]: 1st geometry axis – <Limit> [1]: 2nd geometry axis – <Limit> [2]: 3rd geometry axis The minimum clearances are observed with: <ul style="list-style-type: none"> – Working area limitation: No restrictions – Software limit switches: If no transformation is active, or a transformation is active in which a clear assignment of the geometry axes to the linear machine axes is possible, e.g. 5-axis transformations. • <Limit> [3]: Contains the minimum clearance for linear machine axes which, for example, cannot be assigned a geometry axis because of a non-linear transformation. This value is also used as limit value for the monitoring of the conventional protection zones and the collision avoidance protection zones. • <Limit> [4]: Contains the minimum clearance for rotary machine axes which, for example, cannot be assigned a geometry axis because of a non-linear transformation. 	
	Note This value is only active for the monitoring of the software limit switches for special transformations.	
	Parameter type:	Input
	Data type:	VAR REAL [5]
	Value range:	-max. REAL value ≤ x[n] ≤ +max. REAL value

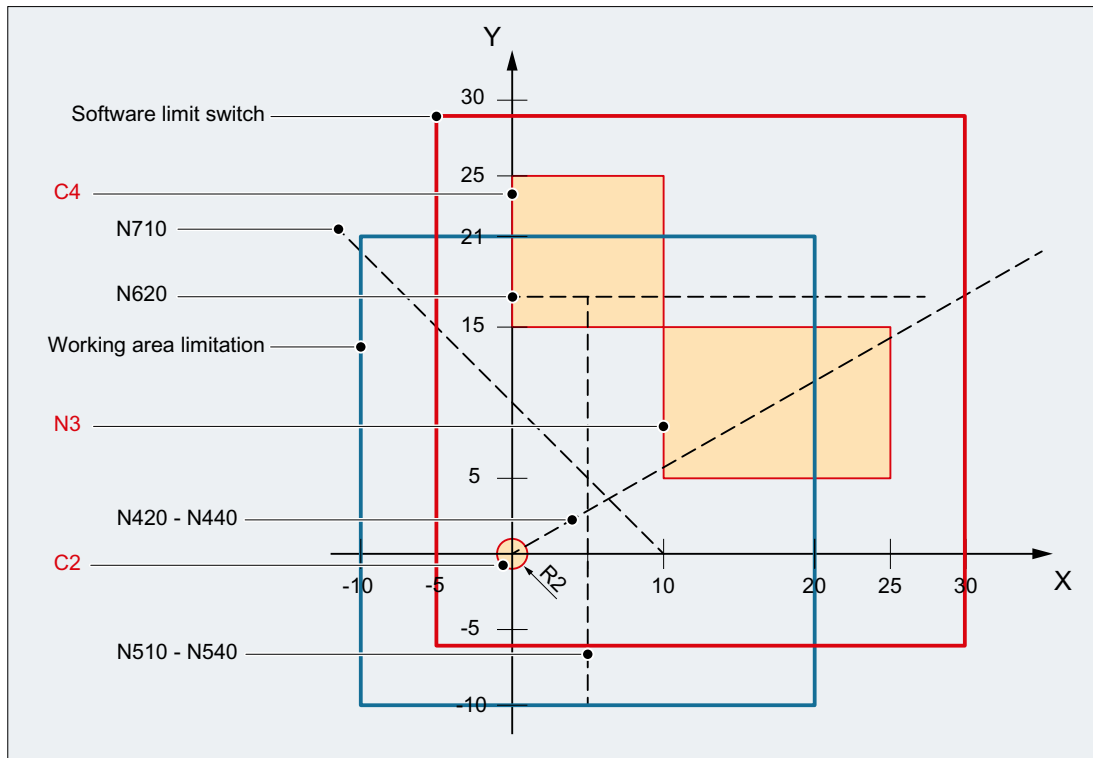

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

<MaxDist>:	Reference to a vector with the incremental traversing distance in which the specified minimum clearance of an axis limit is not violated by any of the relevant machine axes:		
	<ul style="list-style-type: none">• <Dist> [0]: 1st geometry axis• <Dist> [1]: 2nd geometry axis• <Dist> [2]: 3rd geometry axis		
	If the traversing distance is not restricted, the contents of this return parameter are the same as the contents of <Dist>.		
	For <TestID>, bit 4 == 1: <Dist> and <MaxDist>		
	<MaxDist> and <Dist> must contain vectors as input values that span a motion plane. The two vectors must be mutually linearly independent. The absolute value of <MaxDist> is arbitrary. For the calculation of the motion direction, see the description for <Dist>.		
	Parameter type:	Output	
	Data type:	VAR REAL [3]	
	Value range:	-max. REAL value ≤ x[<n>] ≤ +max. REAL value	
<MeasSys>:	Measuring system (inch/metric) for position and distance specifications (optional)		
	Data type:		BOOL
	Value:	FALSE (Default)	System of units corresponding to the currently active G command from the G group 13 (G70, G71, G700, G710). Note If G70 is active and the basic system is metric (or G71 is active and the basic system is inch), the system variables \$AA_IW and \$AA_MW are provided in the basic system and, if used, must be converted for CALCPOSI.
		TRUE	System of units according to the set basic system: MD52806 \$MN_ISO_SCALING_SYSTEM
<TestLim>:	Bit-coded selection of the limits to be monitored (optional)		
	Data type:		INT
	Default value:		Bits 0, 1, 2, 3, 6, 7 == 1 (207)
	Bit	Decimal	Meaning
	0	1	Software limit switch
	1	2	Working area limitation
	2	4	Activated conventional protection zones
	3	8	Preactivated conventional protection zones
	4	16	With violated software limit switches or working area limits in <Dist>, return the traversing direction as in Case 1 (see above).
	5	32	With violated software limit switches or working area limits in <Dist>, return the traversing direction as in Case 2 (see above).
	6	64	Activated collision avoidance protection zones
	7	128	Preactivated collision avoidance protection zones
	8	256	Pairs of activated and preactivated collision avoidance protection zones

¹⁾ If several protection zones are violated, the protection zone with the greatest restriction on the specified traversing distance is returned.

Example

Limitations

In the example, the active software limit switches and working area limits in the X-Y plane and the following three protection zones are displayed:

- C2: Tool-related, channel-specific protection zone, active, circular, radius = 2 mm
- C4: Workpiece-related, channel-specific protection zone, preactivated, square, side length = 10 mm
- N3: Machine-specific protection zone, active, rectangular, side length = 10 mm x 15 mm

NC program

The protection zones and working area limits are defined first in the NC program. The `CALCPOSI()` function is then called with different parameter assignments.

Results of CALCPOSI()

N...	<status>	<MaxDist>[0] Δ X	<MaxDist>[1] Δ Y	Remarks
420	3123	8.040	4.594	N3 is violated.
430	1122	20.000	11.429	No protection zone monitoring, working area limitation is violated.
440	1121	30.000	17.143	Only software limit monitoring is still active.
510	4213	0.000	0.000	Starting point violates C4
520	0000	0.000	-27.000	Preactivated C4 is not monitored. The specified distance can be traversed completely.
540	2222	0.000	-25.000	Because _LIMIT[1] = 2, the traversing distance is restricted by the working area limitation.

4.3 Checking for protection zone violation, working area limitation and software limit switches (CALCPOSI)

N...	<status>	<MaxDist>[0] Δ X	<MaxDist>[1] Δ Y	Remarks
620	4223	-13.000	0.000	Clearance to C4 is a total of 4 mm due to C2 and _LIMIT[3]. Clearance C2 → N3 of 0.1 mm does not result in limitation of the traversing distance.
710	1221	0.000	21.213	Frame with translation and rotation active. The permissible traversing distance in _DIST applies in the shifted and rotated WCS.
820	102121	18.000	18.000	The software limit switch of the Y axis is violated. The calculation of a further traversing direction is requested with <_TESTLIM> = 17. This direction is in _DIST (0.707, 0.0, 0.707). It is valid because the hundred thousands digit is set in <_STATUS>.

Additional information

"Referenced" axis status

All machine axes considered by CALCPOSI () must be homed.

Circle-related distance specifications

All circle-related distance specifications are **always** interpreted as radius specifications. This must be taken into account particularly for transverse axes with activated diameter programming (DIAMON/DIAM90).

Traversing distance reduction

If the specified traversing distance of an axis is limited, the traversing distance of the other axes is also reduced proportionally in the <MaxDist> return value. The resulting end point is therefore still on the specified path.

Rotary axes

Rotary axes are only monitored when they are not modulo rotary axes.

It is permissible that no software limit switches, working area limits or protection zones are defined for one or more of the relevant axes.

Software limit switch and working area limitation status

Software limit switches and working area limits are only taken into account if they are active during the execution of CALCPOSI (). The status can be influenced, for example, via:

- Machine data: MD21020 \$MC_WORKAREA_WITH_TOOL_RADIUS
- Setting data: \$AC_WORKAREA_CS_...
- NC/PLC interface signals DB31, ... DBX12.2 / 3
- Commands: WALIMON / WALIMOF

Software limit switches and transformations

With `CALCPOSI()`, the positions of the machine axes (MCS) cannot always be uniquely determined from the positions of the geometry axes (WCS) during various kinematic transformations (e.g. `TRANSMIT`) because of ambiguities at certain positions of the traversing distance. In normal traversing operation, the uniqueness generally results from the history and the condition that a continuous motion in the WCS must correspond to a continuous motion in the MCS. Therefore, when monitoring the software limit switches, the machine position at the time when `CALCPOSI()` is executed is used to resolve the ambiguity in such cases.

Note**Preprocessing stop**

When using `CALCPOSI()` in conjunction with transformations, it is the sole responsibility of the user to program a preprocessing stop (`STOPRE`) with the preprocessing before `CALCPOSI()` for the synchronization of the machine axis positions.

Protection zone clearance and conventional protection zones

With conventional protection zones, there is **no** guarantee that the safety clearance set in parameter `<Limit>[3]` is maintained for all protection zones during a traversing movement on the specified path. It is only guaranteed that no protection zone will be violated when the end point returned in `<Dist>` is extended by the safety clearance in the traversing direction. However, the straight line can pass very close to a protection zone.

Protection zone clearance and collision avoidance protection zones

With collision avoidance protection zones, there is a guarantee that the safety clearance set in parameter `<Limit>[3]` is maintained for all protection zones during a traversing movement on the specified traversing path.

The safety clearance specified in parameter `<Limit>[3]` only takes effect when the following applies:

`<Limit>[3] > (MD10619 $MN_COLLISION_TOLERANCE)`

If bit 4 is set in parameter `<TestLim>` (calculation of the ongoing traversing direction), then the direction vector received in `<DIST>` is only valid when the hundred thousands digit is set in the function return value (`<status>`). If a direction such as this cannot be determined, either because protection zones were violated, or because a transformation is active, then the input value in `<DIST>` remains unchanged. An additional error message is not output.

Special motion commands

5.1 Approaching coded positions (CAC, CIC, CDC, CACP, CACN)

You can traverse linear and rotary axes via position numbers to fixed axis positions saved in machine data tables using the following commands. This type of programming is called "approach coded positions".

Syntax

```
CAC (<n>)
CIC (<n>)
CACP (<n>)
CACN (<n>)
```

Meaning

CAC (<n>):	Approach coded position from position number n
CIC (<n>):	Starting from the actual position number, approach the coded position n position locations before (+n) or back (-n)
CDC (<n>):	Approach the position from position number n along the shortest path (only for rotary axes)
CACP (<n>):	Approach coded position from position number n in the positive direction (only for rotary axes)
CACN (<n>):	Approach coded position from position number n in the negative direction (only for rotary axes)
<n>:	Position number within the machine data table Range of values: 0, 1, ... (max. number of table locations - 1)

Example: Approach coded positions of a positioning axis

Programming code	Comment
N10 FA[B]=300	; Feedrate for positioning axis B
N20 POS[B]=CAC(10)	; Approach coded position from position number 10
N30 POS[B]=CIC(-4)	; Approach coded position from "current position number" - 4

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Randomly curved workpiece contours cannot be precisely defined in an analytic form. This is the reason why these type of contours are approximated using a limited number of points along curves, e.g. when digitizing surfaces. The points along the curve must be connected to define a contour in order to generate the digitized surface of a workpiece. Spline interpolation permits this.

A spline defines a curve which is formed from polynomials of 2nd or 3rd degree. The characteristics of the points along the curve of a spline can be defined **depending on the spline type being used**.

For SINUMERIK solution line, the following spline types are available:

- A spline
- B spline
- C spline

Syntax

General:

```
ASPLINE X... Y... Z... A... B... C...
BSPLINE X... Y... Z... A... B... C...
CSPLINE X... Y... Z... A... B... C...
```

For a B spline, the following can be additionally programmed:

```
PW=<n>
SD=2
PL=<value>
```

For A and C splines, the following can be additionally programmed:

```
BAUTO / BNAT / BTAN
```

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

EAUTO / ENAT / ETAN

Meaning

Spline interpolation type type:			
ASPLINE:	Command to activate A spline interpolation		
BSPLINE:	Command to activate B spline interpolation		
CSPLINE:	Command to activate C spline interpolation		
	The ASPLINE, BSPLINE and CSPLINE commands are modally effective and belong to the group of motion commands.		
Points along a curve and check points:			
X... Y... Z...	Positions in Cartesian coordinates		
A... B... C...			
Point weight (only B spline):			
PW:	Using the PW command, a so-called "point weight" can be programmed for every point along the curve.		
<n>:	"Point weight"		
	Range of values:	0 ≤ n ≤ 3	
	Increment:	0.0001	
	Effect:	n > 1	The checkpoint attracts the curve more significantly.
		n < 1	The checkpoint attracts the curve less significantly.
Spline degree (only B spline):			
SD:	A third degree polygon is used as standard, However, a second degree polygon can also be used by programming SD=2.		
Distance between nodes (only B spline):			
PL :	The distances between nodes are suitably calculated internally. The control can also machine pre-defined node clearances that are specified in the so-called parameter-interval-length using the PL command.		
<value>:	Parameter interval length		
	Range of values:	As for path dimension	
Transitional behavior at the start of the spline curve (only A or C spline):			
BAUTO:	No specifications for the transitional behavior. The start is determined by the position of the first point.		
BNAT:	Zero curvature		
BTAN:	Tangential transition to the previous block (delete position)		
Transitional behavior at the end of the spline curve (only A or C spline):			
EAUTO:	No specifications for the transitional behavior. The end is determined by the position of the last point.		
ENAT:	Zero curvature		

ETAN:	Tangential transition to the previous block (delete position)

Note

The programmable transitional behavior has no influence on the B spline. The B spline is always tangential to the check polygon at its start and end points.

Supplementary conditions

- Tool radius compensation may be used.
- Collision monitoring is carried out in the projection in the plane.

Examples

Example 1: B spline

Program code 1 (all weights 1)

```

N10 G1 X0 Y0 F300 G64
N20 BSPLINE
N30 X10 Y20
N40 X20 Y40
N50 X30 Y30
N60 X40 Y45
N70 X50 Y0

```

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Program code 2 (different weights)

```

N10 G1 X0 Y0 F300 G64
N20 BSPLINE
N30 X10 Y20 PW=2
N40 X20 Y40
N50 X30 Y30 PW=0.5
N60 X40 Y45
N70 X50 Y0

```

Program code 3 (check polygon)

Comment

```

N10 G1 X0 Y0 F300 G64
N20
N30 X10 Y20
N40 X20 Y40
N50 X30 Y30
N60 X40 Y45
N70 X50 Y0

```

; n.a.

Example 2: C spline, zero curvature at the start and at the end

Program code

```

N10 G1 X0 Y0 F300
N15 X10
N20 BNAT ENAT
N30 CSPLINE X20 Y10

```

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Program code

```
N40 X30
N50 X40 Y5
N60 X50 Y15
N70 X55 Y7
N80 X60 Y20
N90 X65 Y20
N100 X70 Y0
N110 X80 Y10
N120 X90 Y0
N130 M30
```

Example 3: Spline interpolation (A spline) and coordinate transformation (ROT)

Main program:

Program code	Comment
N10 G00 X20 Y18 F300 G64	; Approach starting point.
N20 ASPLINE	; Activate interpolation type A spline.
N30 CONTOUR	; First subprogram call.
N40 ROT Z-45	; Coordinate transformation: Rotation of the WCS through -45° around the Z axis.
N50 G00 X20 Y18	; Approach contour starting point.
N60 CONTOUR	; Second subprogram call.
N70 M30	; End of program

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Subprogram "contour" (includes the coordinates of the points along the curve):

Program code

```
N10 X20 Y18
N20 X10 Y21
N30 X6 Y31
N40 X18 Y31
N50 X13 Y43
N60 X22 Y42
N70 X16 Y58
N80 X33 Y51
N90 M1
```

In addition to the spline curve, resulting from the example program (ASPLINE), the following diagram also contains the spline curves that would have been obtained when activating either B or C spline interpolation (BSPLINE, CSPLINE):

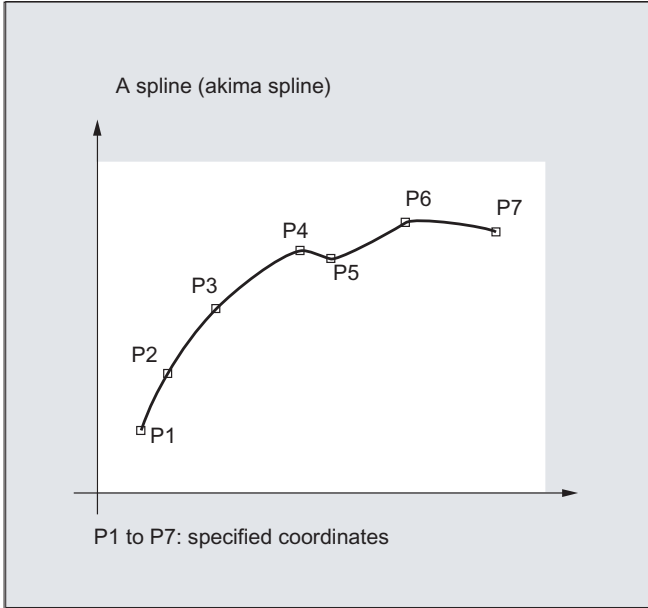

Further information

Advantages of spline interpolation

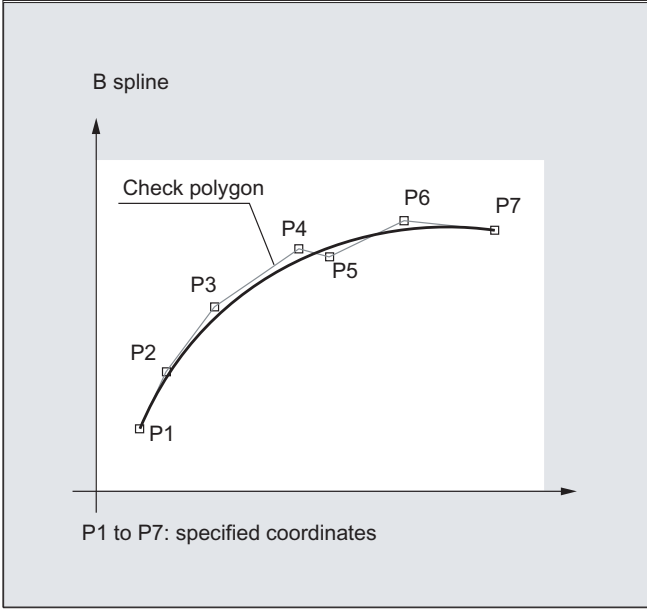

With spline interpolation, the following advantages can be obtained contrary to using straight line blocks G01:

- The number of part program blocks required to describe the contour are reduced
- Soft, curve characteristics that reduce the stress on the mechanical system at transitions between part program blocks.

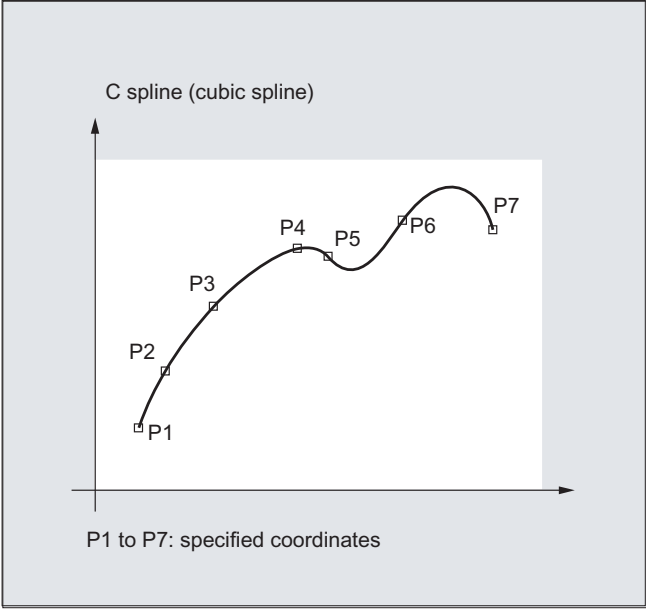

Properties and use of the various spline types

Spline type	Properties and use
A spline	<div><p>A spline (akima spline)</p><p>P1 to P7: specified coordinates</p></div> <p>Properties:</p> <ul style="list-style-type: none">• Passes exactly through the specified intermediate points along the curve.• The curve characteristic is tangential, but does not have continuous curvature.• Produces hardly any undesirable oscillations.• The area of influence of changes to intermediate points along the curve is local. This means that a change to an intermediate point along the curve only affects up to max. 6 adjacent intermediate points. <p>Application:</p> <p>The A spline is especially suitable for interpolating curves with large changes in the gradient (e.g. staircase-type curves and characteristics).</p>

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Spline type	Properties and use
B spline	<div data-bbox="611 325 1260 936">  </div> <p>Properties:</p> <ul style="list-style-type: none"> • Does not run through the specified intermediate points along the curve, but only close to them. The intermediate points do not attract the curve. The curve characteristic can be additionally influenced by weighting the intermediate points using a factor. • The curve characteristic is tangential with continuous curvature. • Does not generate any undesirable oscillations. • The area of influence of changes to intermediate points along the curve is local. This means that a change to an intermediate point along the curve only affects up to max. 6 adjacent intermediate points. <p>Application: The B spline is primarily intended as interface to CAD systems.</p>

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Spline type	Properties and use
C spline	<div><p>C spline (cubic spline)</p><p>P1 to P7: specified coordinates</p></div> <p>Properties:</p> <ul style="list-style-type: none">• Passes exactly through the specified intermediate points along the curve.• The curve characteristic is tangential with continuous curvature.• Frequently generates undesirable oscillations, especially at positions where the gradient changes significantly.• The area of influence of changes to the intermediate points is global. This means that if an intermediate point is changed then this influences the complete curved characteristic. <p>Application:</p> <p>The C spline can be well used when the intermediate points lie on a curve defined analytically (circle, parabola, hyperbola).</p>

5.2 Spline interpolation (ASPLINE, BSPLINE, CSPLINE, BAUTO, BNAT, BTAN, EAUTO, ENAT, ETAN, PW, SD, PL)

Comparison of three spline types with identical interpolation points

Minimum number of spline blocks

The G codes `ASPLINE`, `BSPLINE` and `CSPLINE` link block end points with splines. For this purpose, a series of blocks (end points) must be simultaneously calculated. The buffer size for calculations is ten blocks as standard. Not every piece of block information is a spline end point. However, the control needs a certain number of spline end-point blocks for every ten blocks:

Spline type	Minimum number of spline blocks
A spline:	At least 4 blocks out of every 10 must be spline blocks. These do not include comment blocks or parameter calculations.
B spline:	At least 6 blocks out of every 10 must be spline blocks. These do not include comment blocks or parameter calculations.
C spline:	The required minimum number of spline blocks is the result of the following sum: Value of MD20160 \$MC_CUBIC_SPLINE_BLOCKS + 1 The number of points to calculate the spline segment is entered in MD20160. The default setting is 8%. At least 9 blocks out of every 10 must be spline blocks.

Note

An alarm is output if the tolerated value is undershot and likewise when one of the axes involved in the spline is programmed as a positioning axis.

Combine short spline blocks

Spline interpolation can result in short spline blocks, which reduce the path velocity unnecessarily. The "Combine short spline blocks" function allows you to combine these blocks such that the resulting block length is sufficient and does not reduce the path velocity.

The function is activated via the channel-specific machine data:

MD20488 \$MC_SPLINE_MODE (setting for spline interpolation).

References:

Function Manual, Basic Functions; Continuous-Path Mode, Exact Stop, Look Ahead (B1),
Chapter: Combine short spline blocks

5.3 Spline group (SPLINEPATH)

The axes to be interpolated in the spline group are selected using the `SPLINEPATH` command. Up to eight path axes can be involved in a spline interpolation grouping.

Note

If `SPLINEPATH` is not explicitly programmed, then the first three axes of the channel are traversed as spline group.

Syntax

The spline group is defined in a separate block:

```
SPLINEPATH (n, X, Y, Z, ...)
```

Meaning

<code>SPLINEPATH:</code>	Command to define a spline group
<code>n:</code>	=1 (fixed value)
<code>X, Y, Z, ... :</code>	Identifier of the path axes to be interpolated in the spline group

Example: Spline group with three path axes

Program code	Comment
N10 G1 X10 Y20 Z30 A40 B50 F350	
N11 SPLINEPATH(1,X,Y,Z)	; Spline group
N13 CSPLINE BAUTO EAUTO X20 Y30 Z40 A50 B60	; C spline
N14 X30 Y40 Z50 A60 B70	; Intermediate points
...	
N100 G1 X... Y...	; Deselect spline interpolation

5.4 Activating/deactivating NC block compression (COMPON, COMPCURV, COMPCAD, COMPSURF, COMPOF)

5.4 Activating/deactivating NC block compression (COMPON, COMPCURV, COMPCAD, COMPSURF, COMPOF)

The functions to compress linear blocks (and dependent on the parameterization, also circular and/or rapid traverse blocks) are activated/deactivated using G commands of G group 30. The commands are modal.

Syntax

```
COMPON / COMPCURV / COMPCAD / COMPSURF
...
COMPOF
```

Meaning

COMPON:	Activating the compressor function COMPON
COMPCURV:	Activating the compressor function COMPCURV
COMPCAD:	Activating the compressor function COMPCAD
COMPSURF:	Activating the compressor function COMPSURF
COMPOF :	Deactivating the currently active compressor function

Note

The rounding function G642 and jerk limitation SOFT further improve the surface quality. These commands must be written at the beginning of the program.

Example: COMPCAD

Program code	Comment
N10 G00 X30 Y6 Z40	
N20 G1 F10000 G642	; Activation: Rounding function G642
N30 SOFT	; Activation: Jerk limitation SOFT
N40 COMPCAD	; Activation: Compressor function COMPCAD
N50 STOPFIFO	
N24050 Z32.499	; 1st traversing block
N24051 X41.365 Z32.500	; 2nd traversing block
...	
N99999 X... Z...	; last traversing block
COMPOF	; compressor function off.
...	

5.5 Polynomial interpolation (POLY, POLYPATH, PO, PL)

It actually involves a polynomial interpolation (POLY) and not a spline interpolation type. Its main purpose is to act as an interface for programming externally generated spline curves where the spline sections can be programmed directly.

This mode of interpolation relieves the NC of the task of calculating polynomial coefficients. It can be optimally applied in cases where the coefficients are supplied directly by a CAD system or post processor.

Syntax

3rd degree polynomial:

```
POLY PO[X]=(xe,a2,a3) PO[Y]=(ye,b2,b3) PO[Z]=(ze,c2,c3) PL=n
```

5th degree polynomial and new polynomial syntax:

```
POLY X=PO(xe,a2,a3,a4,a5) Y=PO(ye,b2,b3,b4,b5) Z=PO(ze,c2,c3,c4,c5)
PL=n
POLYPATH("AXES","VECT")
```

Note

The sum of the polynomial coefficients and axes programmed in an NC block must not exceed the maximum permitted number of axes per block.

Meaning

POLY :	Activation of polynomial interpolation with a block containing POLY.
POLYPATH :	Polynomial interpolation can be selected for both AXIS or VECT axis groups
PO[axis identifier/variable] :	End points and polynomial coefficients
X, Y, Z:	Axis identifier
xe, ye, ze :	Specification of end position for the particular axis; value range as for path dimension
a2, a3, a4, a5 :	The coefficients a_2 , a_3 , a_4 , and a_5 are written with their value; value range as for path dimension. The last coefficient in each case can be omitted if it equals zero.
PL :	<p>Length of the parameter interval where polynomials are defined (definition range of the function $f(p)$).</p> <p>The interval always starts at 0, p can assume values from 0 to PL.</p> <p>Theoretical value range for PL: 0.0001 ... 99 999.9999</p> <p>Note: The PL value applies to the block in which it is located. If no PL is programmed, then PL=1 is applied.</p>

Activating/deactivating polynomial interpolation

The polynomial interpolation is activated in the part program using the `POLX G` command.

The `POLY G` command together with `G0`, `G1`, `G2`, `G3`, `ASPLINE`, `BSPLINE` and `CSPLINE` belong to the 1st group.

Axes, which are only programmed with name and end point (e.g. `X10`), are linearly moved. If all axes of an NC block are programmed in this way, the control behaves the same as for `G1`.

The polynomial interpolation is implicitly deactivated again by programming another command of the 1st G group `G0`, `G1`).

Polynomial coefficient

The `PO` value (`PO[]=`) or `...=PO(...)` specifies all polynomial coefficients for an axis. Several values are specified, separated by commas corresponding the degree of the polynomial. Different degrees of polynomials are possible for various axes within one block.

POLYPATH subprogram

Using `POLYPATH(...)`, the polynomial interpolation can be selectively released for certain axis groups:

Only path axes and supplementary axes:	<code>POLYPATH("AXES")</code>
Only orientation axes: (when moving with orientation transformation)	<code>POLYPATH("VECT")</code>

The axes that are not released are linearly moved.

Polynomial interpolation is enabled as standard for both axis groups.

Polynomial interpolation is deactivated for all axes by programming without the `POLYPATH()` parameter.

Example

Program code	Comment
N10 G1 X... Y... Z... F600	
N11 POLY PO[X]=(1,2.5,0.7) PO[Y]=(0.3,1,3.2) PL=1.5	; Polynomial interpolation on
N12 PO[X]=(0,2.5,1.7) PO[Y]=(2.3,1.7) PL=3	
...	
N20 M8 H126 ...	
N25 X70 PO[Y]=(9.3,1,7.67) PL=5	; Mixed data for the axes
N27 PO[X]=(10,2.5) PO[Y]=(2.3)	; No PL programmed; PL=1 applies
N30 G1 X... Y... Z.	; Polynomial interpolation off
...	

Example: New polynomial syntax

Polynomial syntax that is still valid	New polynomial syntax
PO[axis identifier]=(.. , ..)	Axis identifier=PO(.. , ..)
PO[PHI]=(.. , ..)	PHI=PO(.. , ..)
PO[PSI]=(.. , ..)	PSI=PO(.. , ..)
PO[THT]=(.. , ..)	THT=PO(.. , ..)
PO[]=(.. , ..)	PO(.. , ..)
PO[variable]=IC(.. , ..)	variable=PO IC(.. , ..)

Example: Curve in the X/Y plane.

Programming

Program code
N9 X0 Y0 G90 F100
N10 POLY PO[Y]=(2) PO[X]=(4,0.25) PL=4

Shape of the curves X(p) and Y(p)

Shape of the curve in the XY plane

Description

The equation to express the polynomial function is generally as follows:

$$f(p) = a_0 + a_1p + a_2p^2 + \dots + a_np^n$$

with: a_i : constant coefficients ($i = 0, 1, \dots, n$)

p : Parameter

In the control, polynomials up to a maximum of the 5th degree can be programmed:

$$f(p) = a_0 + a_1p + a_2p^2 + a_3p^3 + a_4p^4 + a_5p^5$$

By assigning concrete values to these coefficients, it is possible to generate various curve shapes such as line, parabola and power functions.

A straight line is generated with $a_2 = a_3 = a_4 = a_5 = 0$:

$$f(p) = a_0 + a_1p$$

The following still applies:

a_0 : Axis position at the end of the preceding block

$p = PL$

$$a_1 = (x_E - a_0 - a_2 \cdot p^2 - a_3 \cdot p^3) / p$$

It is possible to program polynomials **without** the polynomial interpolation having been activated using the G command `POLY`. In this case, the programmed polynomials are not interpolated, but instead, all of the programmed end points of the axis are linearly approached (`G1`). The programmed polynomials are only moved as such after explicitly activating polynomial interpolation in the part program (`POLY`).

Special feature: Denominator polynomial

Command `PO[]=(...)` can be used to program a common denominator polynomial for the geometry axes (without specifying an axis name), i.e. the motion of the geometry axes is then interpolated as the quotient of two polynomials.

With this programming option, it is possible to represent shapes such as conics (circle, ellipse, parabola, hyperbola) exactly.

Example:

Program code	Comment
<code>POLY G90 X10 Y0 F100</code>	; Geometry axes traverse linearly to position X10 Y0.
<code>PO[X]=(0,-10) PO[Y]=(10) PO[]=(2,1)</code>	; Geometry axes traverse along the quadrant to X0 Y10.

The constant coefficient (a_0) of the denominator polynomial is always assumed to be 1. The programmed end point is independent of G90 / G91.

X(p) and Y(p) are calculated as follows from the programmed values:

$$\begin{aligned} X(p) &= (10 - 10 \cdot p^2) / (1 + p^2) \\ Y(p) &= 20 \cdot p / (1 + p^2) \\ \text{with } 0 \leq p \leq 1 \end{aligned}$$

As a result of the programmed start points, end points, coefficient a_2 and PL=1, the intermediate results are as follows:

$$\begin{aligned} \text{Numerator (X)} &= 10 + 0 \cdot p - 10 \cdot p^2 \\ \text{Numerator (Y)} &= 0 + 20 \cdot p + 0 \cdot p^2 \\ \text{Denominator} &= 1 + p^2 \end{aligned}$$

If polynomial interpolation is active and a denominator polynomial is programmed with zeros within the interval $[0, PL]$, this is rejected and an alarm is output. Denominator polynomials have no effect on the motion of special axes.

Note

Tool radius compensation can be activated with G41, G42 in conjunction with polynomial interpolation and can be applied in the same way as in linear or circular interpolation modes.

5.6 Settable path reference (SPATH, UPATH)

For polynomial interpolation (POLY, ASPLINE, BSPLINE, CSPLINE, COMPON, COMPCURV), the positions of the path axes *i* are specified as polynomials *p_i(U)*. The curve parameter *U* moves from 0 to 1 within an NC block.

FGROUP selects the axes (FGROUP axes) to which the path feedrate *F* applies. An interpolation with constant speed on the path *S* of the FGROUP axes means during the polynomial interpolation normally a non-constant change of the curve parameter *U*. Consequently, two possibilities are available for selecting the axes not contained in FGROUP on how they should follow the FGROUP axes:

- Synchronous to path *S* (SPATH)
- Synchronous to curve parameter *U* (UPATH)

Syntax

SPATH
UPATH

Meaning

SPATH:	The axes not contained in FGROUP are traversed with reference to path <i>S</i>
UPATH:	The axes not contained in FGROUP are traversed with reference to curve parameter <i>U</i>

Note

UPATH and SPATH also define the interrelationship of the *F* word polynomial (FPOLY, FCUB, FLIN) with path motion.

Supplementary conditions

SPATH and UPATH have no meaning for:

- Linear interpolation (G1)
- Circuit interpolation (G2, G3)
- Thread blocks (G33, G34, G35, G33x, G63)
- All path axes are contained in FGROUP

Example

The following example shows the difference between both types of motion control.

Program code
N10 FGROUP (X,Y,Z)
N15 G1 X0 A0 F1000 SPATH ; SPATH
N20 POLY PO[X]=(10,10) A10

Program code

```

N10 FGROUP(X,Y,Z)
N15 G1 X0 A0 F1000 UPATH          ; UPATH
N20 POLY PO[X]=(10,10) A10

```

In both program sections, the path S of the FGROUP axes in N20 is dependent on the square of curve parameter U. Therefore, different position arise for synchronized axis A along path X, according to whether SPATH or UPATH is active.

**Further information****Control behavior for reset and machine/option data**

The G command, defined with MD20150 \$MC_GCODE_RESET_VALUES[44], is effective after a reset (45th. G group).

The initial state for the type of smoothing is defined with MD20150 \$MC_GCODE_RESET_VALUES[9] (10th G group).

The axis-specific machine data MD33100 \$MA_COMPRESS_POS_TOL[<n>] has an extended significance: It contains the tolerances for the compressor function and for smoothing with G642.

5.7 Measuring with touch-trigger probe (MEAS, MEAW)

The "Measure with touch-trigger probe" is used to approach actual positions on the workpiece. On the probe's switching edge, the positions for all axes programmed in the measurement block are measured and written to the appropriate memory cell for each axis.

The following two fixed addresses are available for programming the function:

- MEAS
MEAS deletes the distance-to-go between the actual and setpoint positions.
- MEAW
MEAW is used in the case of measuring tasks where the programmed position always needs to be approached.

MEAS and MEAW are non-modal; they are programmed together with motion operations. The feedrate and interpolation type (G0, G1, etc.) as well as the number of axes must be adapted for the respective measuring task.

Syntax

```
MEAS=<TE> G... X... Y... Z...
MEAW=<TE> G... X... Y... Z...
```

Meaning

MEAS:	Command: Measurement with delete distance-to-go	
	Effective:	Non-modal
MEAW:	Command: Measurement without delete distance-to-go	
	Effective:	Non-modal

5.7 Measuring with touch-trigger probe (MEAS, MEAW)

<TE>:	Trigger event to initiate measurement		
	Type:	INT	
	Range of values:		-2, -1, 1, 2
	Meaning:		
	(+)1	Rising edge of probe 1 (measuring input 1)	
	-1	Falling edge of probe 1 (measuring input 1)	
	(+)2	Rising edge of probe 2 (measuring input 2)	
	-2	Falling edge of probe 2 (measuring input 2)	
	Note: There are up to a maximum of 2 probes (dependent on configuration level).		
	G...:	Type of interpolation, e.g. G0, G1, G2 or G3	
X... Y... Z...:	End points in Cartesian coordinates		

Example

Program code	Comment
N10 MEAS=1 G1 F1000 X100 Y730 Z40	; Measurement block with probe at first measuring input and linear interpolation. A preprocessing stop is automatically generated.
...	

Further information

Measuring task status

If an evaluation of whether or not the probe has been triggered is required in the program, status variable \$AC_MEA[<n>] (<n> = number of the measuring probe) can be checked:

Value	Meaning
0	Measuring task not completed.
1	Measuring task completed successfully (the probe has been triggered).

Note

If the program is deflected in the program, the variable is set to 1. At the start of a measurement block, the variable is automatically set to the initial state of the probe.

5.7 Measuring with touch-trigger probe (MEAS, MEAW)

Reading measured values

The positions of all traversing path and positioning axes of the block are acquired (maximum number of axes depending on the control configuration). In the case of `MEAS`, the motion is decelerated in a defined way following the triggering of the probe.

Note

If a geometry axis is programmed in a measuring block, the measured values are stored for all current geometry axes.

If an axis participating in a transformation is programmed in a measurement block, the measured values for all axes participating in this transformation are recorded.

Reading measurement results

The measurement results for the axes measured with probes can be read via the following system variables:

- `$AA_MM[<axis>]`
Measurement results in the machine coordinate system
- `$AA_MW[<axis>]`
Measurement results in the workpiece coordinate system

5.8 Axis-specific measurement (MEASA, MEAWA, MEAC) (option)

Several probes and several measuring systems can be used for axis-specific measurement.

The keywords `MEASA`, `MEAWA` and `MEAC` are available for programming the function.

With `MEASA` or `MEAWA` for the programmed axis, up to four measured values are acquired for each measurement and are then saved in system variables in accordance with the trigger event.

Measuring operations can be executed with `MEAC`. In this case, the measurement results are stored in FIFO variables.

Syntax

```
MEASA[<axis>]=(<mode>,<TE1>,...,<TE4>)
MEAWA[<axis>]=(<mode>,<TE1>,...,<TE4>)
MEAC[<axis>]=(<mode>,<measurement memory>,<TE1>,...,<TE4>)
```

Note

`MEASA` and `MEAWA` are non-modal; they can be programmed together in one block. However, if `MEASA/MEAWA` is programmed together with `MEAS/MEAW` in the same block, an error message is output.

Meaning

MEASA:	Keyword: Axis-specific measurement with deletion of distance-to-go	
	Effective:	Non-modal
MEAWA:	Keyword: Axis-specific measurement without delete distance-to-go	
	Effective:	Non-modal

5.8 Axis-specific measurement (MEASA, MEAWA, MEAC) (option)

MEAC:	Keyword: Axis-specific continuous measurement without deletion of distance-to-go	
	Effective:	Non-modal
<axis>:	Name of channel axis used for measurement	
<mode>:	Two-digit number indicating the operating mode (measuring mode and measuring system)	
	Units decade (measuring mode):	
	0	Cancel measuring task.
	1	Up to four different trigger events that can be activated at the same time.
	2	Up to four different trigger events that can be activated in succession.
	3	Up to four different trigger events that can be activated in succession, but with no monitoring of trigger event 1 at the start (alarms 21700/21703 are suppressed).
	Note: This mode is not supported by MEAC.	
	Tens decade (measuring system):	
	0 (or no data)	active measuring system
	1	Measuring system 1
	2	Measuring system 2
	3	Both measuring systems
<TE>:	Trigger event to initiate measurement	
	Type:	INT
	Range of values:	-2, -1, 1, 2
	Meaning:	
	(+)1	Rising edge of probe 1
	-1	Falling edge of probe 1
	(+)2	Rising edge of probe 2
	-2	Falling edge of probe 2
<measurement memory>:	Number of FIFO (circulating storage)	

Examples

Example 1: Axis-specific measurement with delete distance-to-go in mode 1 (evaluation in chronological sequence)

a) With one measuring system

Program code	Comment
...	
N100 MEASA[X]=(1,1,-1) G01 X100 F100	; Measuring in mode 1 with active measuring system. Wait for measuring signal with rising/falling edge from probe 1 for travel path to X=100.
N110 IF \$AC_MEA[1]==FALSE GOTOF END	; Check that the measurement was successful.

5.8 Axis-specific measurement (MEASA, MEAWA, MEAC) (option)

Program code	Comment
N120 R10=\$AA_MM1[X]	; Save measured value acquired at the first programmed trigger event (rising edge).
N130 R11=\$AA_MM2[X]	; Save measured value acquired at the second programmed trigger event (falling edge).
N140 END:	

b) With two measuring systems

Program code	Comment
...	
N200 MEASA[X]=(31,1,-1) G01 X100 F100	; Measuring in mode 1 with both measuring systems. Wait for measuring signal with rising/falling edge from probe 1 for travel path to X=100.
N210 IF \$AC_MEA[1]==FALSE GOTOF END	; Check that the measurement was successful.
N220 R10=\$AA_MM1[X]	; Save measured value of measuring system 1 at rising edge.
N230 R11=\$AA_MM2[X]	; Save measured value of measuring system 2 at rising edge.
N240 R12=\$AA_MM3[X]	; Save measured value of measuring system 1 at falling edge.
N250 R13=\$AA_MM4[X]	; Save measured value of measuring system 2 at falling edge.
N260 END:	

Example 2: Axis-specific measurement with delete distance-to-go in mode 2 (evaluation in programmed sequence)

Program code	Comment
...	
N100 MEASA[X]=(2,1,-1,2,-2) G01 X100 F100	; Measuring in mode 2 with active measuring system. Wait for measuring signal in the sequence rising edge probe 1, falling edge probe 1, rising edge probe 2, falling edge probe 2 while traversing path to X=100.
N110 IF \$AC_MEA[1]==FALSE GOTOF PROBE2	; Check that the measurement with probe 1 is successful.
N120 R10=\$AA_MM1[X]	; Save measured value acquired at the first programmed trigger event (rising edge of probe 1).
N130 R11=\$AA_MM2[X]	; Save measured value acquired at the second programmed trigger event (rising edge of probe 1).
N140, PROBE2:	

5.8 Axis-specific measurement (MEASA, MEAWA, MEAC) (option)

Program code	Comment
N150 IF \$AC_MEA[2]==FALSE GOTOF END	; Check that the measurement with probe 2 is successful.
N160 R12=\$AA_MM3[X]	; Save measured value acquired at the third programmed trigger event (rising edge of probe 2).
N170 R13=\$AA_MM4[X]	; Save measured value acquired at the fourth programmed trigger event (rising edge of probe 2).
N180 END:	

Example 3: Axis-specific continuous measurement in mode 1 (evaluation in chronological sequence)**a) Measurement of up to 100 measured values**

Program code	Comment
...	
N110 DEF REAL MEASVALUE[100]	
N120 DEF INT loop=0	
N130 MEAC[X]=(1,1,-1) G01 X1000 F100	; Measuring in mode with active measuring system, save measured values; under \$AC_FIFO1, wait for measuring system with falling edge from probe 1 travel path to X=1000.
N135 STOPRE	
N140 MEAC[X]=(0)	; Terminate measurement when axis position is reached.
N150 R1=\$AC_FIFO1[4]	; Save number of accumulated measured values in parameter R1.
N160 FOR loop=0 TO R1-1	
N170 MEASURED VALUE[loop]=\$AC_FIFO1[0]	; Read-out measured values from \$AC_FIFO1 and save.
N180 ENDFOR	

b) Measurement with delete distance-to-go after 10 measured values

Program code	Comment
...	
N10 WHEN \$AC_FIFO1[4]>=10 DO MEAC[x]=(0) DELDTG(x)	; Delete distance-to-go.
N20 MEAC[x]=(1,1,1,-1) G01 X100 F500	
N30 MEAC [X]=(0)	
N40 R1 = \$AC_FIFO1[4]	; Number of measured values.
...	

c) Measurement of a falling/rising tooth flank with two probes

Program code	Comment
...	
N110 DEF REAL MEASVALUE[16]	
N120 DEF INT loop=0	
N130 MEAC[X]=(1,1,-1,2) G01 X100 F100	; Measurement in mode 1 with active measuring system, save measured values under \$AC_FIFO1, wait for measuring signal in the sequence falling edge of probe 1, rising edge of probe 2 while traversing the path to X=100.
N140 STOPRE	;Preprocessing stop
N150 MEAC[X]=(0)	; Terminate measurement when axis position is reached.
N160 R1=\$AC_FIFO1[4]	; Save number of accumulated measured values in parameter R1.
N170 FOR loop=0 TO R1-1	
N180 MEASURED VALUE[loop]=\$AC_FIFO1[0]	; Read-out measured values from \$AC_FIFO1 and save.
N190 ENDFOR	

Additional information

Measurement job

A measuring task can be programmed in the part program or from a synchronized action (see Chapter "Synchronized actions (Page 603)"). Please note that only one measuring job can be active at any given time for each axis.

Note

The feed must be adjusted to suit the measuring task in hand.

In the case of MEASA and MEAWA, the correctness of results can be only guaranteed for feedrates at which no more than 1 trigger event of the same type and no more than 4 trigger events of different types occur in each position control cycle.

In the case of continuous measurement with MEAC, the ratio between interpolator clock cycle and position control cycle must not exceed 1:8.

Trigger event

A trigger event comprises the number of the probe and the trigger criterion (rising or falling edge) of the measuring signal.

Up to 4 trigger events of the addressed probe can be processed for each measurement; in other words, up to 2 probes with 2 measuring signal edges each. The processing sequence and the maximum number of trigger events depend on the selected mode.

Note

The following applies for measuring mode 1: The same trigger event may only be programmed once in one measuring task.

For **MEAC**, the number of measured values per trigger event can be increased by using PROFIBUS telegram 395 to a total of 8 measured values for a rising edge and 8 measured values for a falling edge for each trigger event and position controller cycle.

- One probe: 8 measured values for a rising and 8 for a falling edge
- Two probes: 4 measured values for a rising and 4 for a falling edge for each probe

This means that higher feed rates or higher speeds can be reached by using PROFIBUS telegram 395.

References:

Function Manual, Extended Functions; Measurements (M5), Section: Axial measurement

Operating mode

The first digit (tens decade) of the operating mode selects the required measuring system. If only one measuring system is installed, but a second programmed, the installed system is automatically selected.

The second digit (units decade) selects the required measuring mode. The measuring process is thus adapted to the options supported by the relevant control:

- **Mode 1**
Trigger events are evaluated in the chronological sequence in which they occur. When this mode is selected, only one trigger event can be programmed for six-axis modules. If more than one trigger event is specified, the mode selection is switched automatically to mode 2 (without message).
- **Mode 2**
Trigger events are evaluated in the programmed sequence.
- **Mode 3**
Trigger events are evaluated in the programmed sequence but there is no monitoring of trigger event 1 at START.

Note

No more than two trigger events can be programmed if two measuring systems are in use.

Measurement with and without delete distance-to-go

When command **MEASA** is programmed, the distance-to-go is not deleted until all required measured values have been recorded.

The **MEAWA** function is used in the case of special measuring tasks where a programmed position always needs to be approached.

Note

MEASA cannot be programmed in synchronized actions. As an alternative, MEAWA plus delete distance-to-go can be programmed as a synchronized action.

If the measuring task with MEAWA is started from synchronized actions, the measured values will only be available in the machine coordinate system.

Measurement results for MEASA, MEAWA

The results of measurements are available under the following system variables:

- In the machine coordinate system:

5.8 Axis-specific measurement (MEASA, MEAWA, MEAC) (option)

\$AA_MM1[<axis>] Measured value of programmed measuring system on trigger event 1

 \$AA_MM4[<axis>] Measured value of programmed measuring system on trigger event 4

- In the workpiece coordinate system:

\$AA_MW1[<axis>] Measured value of programmed measuring system on trigger event 1

 \$AA_MW4[<axis>] Measured value of programmed measuring system on trigger event 4

Geometry axes/Transformations

If axial measurement is to be started for a geometry axis, the same measuring job must be programmed explicitly for all remaining geometry axes. The same applies to axes involved in a transformation.

Examples:

N10 MEASA[Z]=(1,1) MEASA[Y]=(1,1) MEASA[X]=(1,1) G0 Z100

or

N10 MEASA[Z]=(1,1) POS[Z]=100

Measurement job with two measuring systems

If a measuring job is executed by two measuring systems, each of the two possible trigger events of both measuring systems of the relevant axis is acquired. The assignment of the reserved variables is therefore preset:

\$AA_MM1[<axis>]	or	\$AA_MW1[<axis>]	Measured value from measuring system 1 on trigger event 1
\$AA_MM2[<axis>]	or	\$AA_MW2[<axis>]	Measured value from measuring system 2 on trigger event 1
\$AA_MM3[<axis>]	or	\$AA_MW3[<axis>]	Measured value from measuring system 1 on trigger event 2
\$AA_MM4[<axis>]	or	\$AA_MW4[<axis>]	Measured value from measuring system 2 on trigger event 2

System variables

The probe status is available in the following system variables:

\$A_PROBE[<n>]

Value	Meaning
1	Probe deflected
0	Probe not deflected

The probe limitation is available in the following system variables:

\$A_PROBE_LIMITED[<n>]

Value	Meaning
1	Probe limitation active
0	Probe limitation inactive

<n> = probe

Reference:

List Manual, System Variables

Measuring job status for MEASA, MEAWA

If an evaluation is required in the program, the measuring task status can be queried via \$AC_MEA[<n>], where <n> = number of the probe. This variable returns a value of "1" once all the trigger events of probe <n> that are programmed in a block have occurred. Otherwise, the value is 0.

Note

If measurement is started from synchronized actions, \$AC_MEA is no longer updated. In this case, the new PLC interface signal DB31, ... DBX62.3 or the equivalent variable \$AA_MEA[<axis>] must be queried.

Meaning:

\$AA_MEA==1: Measurement active

\$AA_MEA==0: Measurement not active

Continuous measurement (MEAC)

The measured values for MEAC are available in the machine coordinate system and stored in the programmed FIFO[n] memory (circular buffer). If two probes are configured for the measurement, the measured values of the second probe are stored separately in the FIFO[n+1] memory configured especially for this purpose (defined in machine data).

The FIFO memory is a circular buffer in which measured values are written to \$AC_FIFO variables according to the circular principle, see Section "Synchronized actions (Page 603)".

Note

FIFO contents can be read only once from the circulating storage. If this measured data is to be used several times, it must be buffered in the user data.

If the number of measured values for the FIFO memory exceeds the maximum value defined in machine data, the measurement is automatically terminated.

An endless measuring process can be implemented by reading out measured values cyclically. In this case, data must be read out at the same frequency as new measured values are read in.

Protection against programming errors

The following programming errors are detected and indicated appropriately:

- MEASA/MEAWA programmed with MEAS/MEAW in the same block
Example:
N01 MEAS=1 MEASA[X]=(1,1) G01 F100 POS[X]=100
- MEASA/MEAWA with number of parameters <2 or >5
Example:
N01 MEAWA[X]=(1) G01 F100 POS[X]=100
- MEASA/MEAWA with trigger event not equal to 1/ -1/ 2/ -2
Example:
N01 MEASA[B]=(1,1,3) B100
- MEASA/MEAWA with invalid mode
Example:
N01 MEAWA[B]=(4,1) B100
- MEASA/MEAWA with trigger event programmed twice
Example:
N01 MEASA[B]=(1,1,-1,2,-1) B100
- MEASA/MEAWA and missing geometry axis
Example:
N01 MEASA[X]=(1,1) MEASA[Y]=(1,1) G01 X50 Y50 Z50 F100 ;GEO axis X/
Y/Z
- Inconsistent measuring task with geometry axes
Example:
N01 MEASA[X]=(1,1) MEASA[Y]=(1,1) MEASA[Z]=(1,1,2) G01 X50 Y50 Z50
F100

5.9 Special functions for OEM users (OMA1 ... OMA5, OEMIPO1, OEMIPO2, G810 ... G829)

OEM addresses

The meaning of OEM addresses is determined by the OEM user. Their functionality is incorporated by means of compile cycles. Five OEM addresses are reserved (OMA1 ... OMA5). The address identifiers are settable. OEM addresses can be programmed in any block.

Reserved G command calls

The following G command calls are reserved for OEM users:

- OEMIPO1, OEMIPO2 (from G group 1)
- G810 ... G819 (G group 31)
- G820 ... G829 (G group 32)

Their functionality is incorporated by means of compile cycles.

Functions and subprograms

OEM users can also set up predefined functions and subprograms with parameter transfer.

Note

Workpiece simulation

Up to SW 4.4, no compile cycles were supported, as of SW 4.4, only selected compile cycles (CC) are supported for the workpiece simulation.

Language commands in the part program of compile cycles that are not supported (OMA1 ... OMA5, OEMIPO1/2, G810 ... G829, own procedures and functions) - therefore result in an alarm message and cancellation of the simulation without any individual handling.

Solution: Individually handle the missing CC-specific language elements in the part program (\$P_SIM query).

Example:

```
N1 G01 X200 F500
IF (1==$P_SIM)
N5 X300 ;not active for CC simulation
ELSE
N5 X300 OMA1=10
ENDIF
```

5.10 Feedrate reduction with corner deceleration (FENDNORM, G62, G621)

With automatic corner deceleration the feed rate is reduced according to a bell-shaped curve before reaching the corner. It is also possible to parameterize the extent of the tool behavior relevant to machining via setting data. These are:

- Start and end of feed rate reduction
- Override with which the feed rate is reduced
- Detection of a relevant corner

Relevant corners are those whose inside angle is less than the corner parameterized in the setting data.

Default value `FENDNORM` deactivates the function of the automatic corner override.

References:

/FBFA/ "Function Description ISO Dialects"

Syntax

`FENDNORM`

`G62 G41`

`G621`

Meaning

<code>FENDNORM:</code>	Automatic corner deceleration OFF
<code>G62:</code>	Corner deceleration at inside corners when tool radius offset is active
<code>G621:</code>	Corner deceleration at all corners when tool radius offset is active

G62 only applies to inside corners with

- active tool radius offset `G41`, `G42` and
- active continuous-path mode `G64`, `G641`

The corner is approached at a reduced feed rate resulting from:

$F * (\text{override for feed rate reduction}) * \text{feed rate override}$

The maximum possible feed rate reduction is attained at the precise point where the tool is to change directions at the corner, with reference to the center path.

G621 applies analogously with G62 at each corner of the axes defined by `FGROUP`.

5.11 Programmable end of motion criteria (FINEA, COARSEA, IPOENDA, IPOBRKA, ADISPOSA)

Similar to the block change criterion for path interpolation (G601, G602, and G603) it is also possible to program the end-of-motion criterion for single-axis interpolation in a part program or in synchronized actions for command/PLC axes.

The end-of-motion criterion set will affect how quickly or slowly part program blocks and technology cycle blocks with single-axis movements are completed. The same applies for PLC via FC15/16/18.

Syntax

```

FINEA [<axis>]
COARSEA [<axis>]
IPOENDA [<axis>]
IPOBRKA (<axis>[, <instant in time>])
ADISPOSA [<axis>] = (<mode>, <window size>)

```

Meaning

FINEA:	End-of-motion criterion: "Exact stop fine"	
	Effective:	Modal
COARSEA:	End-of-motion criterion: "Exact stop coarse"	
	Effective:	Modal
IPOENDA:	End-of-motion criterion: "Interpolator stop"	
	Effective:	Modal
IPOBRKA:	Block change criterion: Braking ramp	
	Effective:	Modal
ADISPOSA:	Tolerance window for end-of-motion criterion	
	Effective:	Modal
<axis>:	Channel axis name (X, Y,)	
<instant in time>:	Time of the block change, referred to the braking ramp as a %:	
	<ul style="list-style-type: none"> 100% = start of the braking ramp 0% = end of the braking ramp, the same significance as IPOENDA 	
	Type:	REAL
<mode>:	Reference of the tolerance window	
	Range of values:	0 Tolerance window not active
		1 Tolerance window with respect to set position
		2 Tolerance window with respect to actual position
	Type:	INT
<window size>:	Size of the tolerance window	
	Type:	REAL

5.11 Programmable end of motion criteria (FINEA, COARSEA, IPOENDA, IPOBRKA, ADISPOSA)

Examples

Example 1: End-of-motion criterion: "Interpolator stop"**Program code**

```

; traverse positioning axis X to 100, velocity 200 m/
min, acceleration 90%,
; end-of-motion criterion: Interpolator stop
N110 G01 POS[X]=100 FA[X]=200 ACC[X]=90 IPOENDA[X]

; Synchronized action:
; ALWAYS IF: Input 1 is set
; THEN traverse positioning axis X to 50, velocity 200
m/min, acceleration 140%,
;     end-of-motion criterion: Interpolator stop
N120 EVERY $A_IN[1] DO POS[X]=50 FA[X]=200 ACC[X]=140
IPOENDA[X]

```

Example 2: Block change criterion: "Braking ramp"**Program code****Comment**

	; Default setting is effective
N40 POS[X]=100	; Positioning motion from X to position 100. Block change criterion: Exact stop fine
N20 IPOBRKA(X,100)	; Block change criterion: "Braking ramp", 100% = start of the braking ramp
N30 POS[X]=200	; The block is changed as soon as the X axis starts to brake
N40 POS[X]=250	; X axis no longer brakes at position 200, but rather contin- ues to traverse to position 250. As soon as the axis starts to brake, the block changes.
N50 POS[X]=0	; Axis X brakes and returns to position 0. The block change takes place at position 0 and "exact stop fine"
N60 X10 F100	; Axis X traverses as path axis to position 10

Further information

System variable for end-of-motion criterion

The effective end-of-motion criterion can be read using the system variable \$AA_MOTEND.

References: /LIS2sl/ List Manual, Book 2

Block-change criterion: "Braking ramp" (IPOBRKA)

If, when activating the block change criterion "brake ramp", a value is programmed for the optional block change instant in time, then this becomes effective for the next positioning motion and is written into the setting data synchronized to the main run. If no value is specified for the block change instant in time, then the actual value of the setting data is effective.

SD43600 \$SA_IPOBRAKE_BLOCK_EXCHANGE

IPOBRKA is deactivated for the corresponding access when an axis end-of-motion criterion (FINEA, COARSEA , IPOENDA) is next programmed for the axis.

Additional block-change criterion: "Tolerance window" (ADISPOSA)

Using ADISPOSA, a tolerance window around the end of block (either as actual or setpoint position) can be defined as additional block change criterion. Then, two conditions must be fulfilled for the block change:

- Block-change criterion: "Braking ramp"
- Block-change criterion: "Tolerance window"

References

For further information about the block change criterion for positioning axes, see:

- Function Manual, Extended Functions; Positioning Axes (P2)
- Programming Manual, Fundamentals; Chapter "Feedrate control".

Coordinate transformations (frames)

6.1 Coordinate transformation via frame variables

In addition to the commands such as `ROT`, `AROT` and `SCALE` described in the Fundamentals Programming Manual, "Coordinate transformations (frames)" section, the workpiece coordinate system (WCS) can also be transformed by the frame variables `$P_...FR` (data storage frames) and `$P_...FRAME` (active frames).

The following diagram provides an overview of structuring frame variables:

- Data management frames
- Active frames
- Active total frame: Chain of all active frames
- NCU global frames
- Channel-specific frames

6.1 Coordinate transformation via frame variables

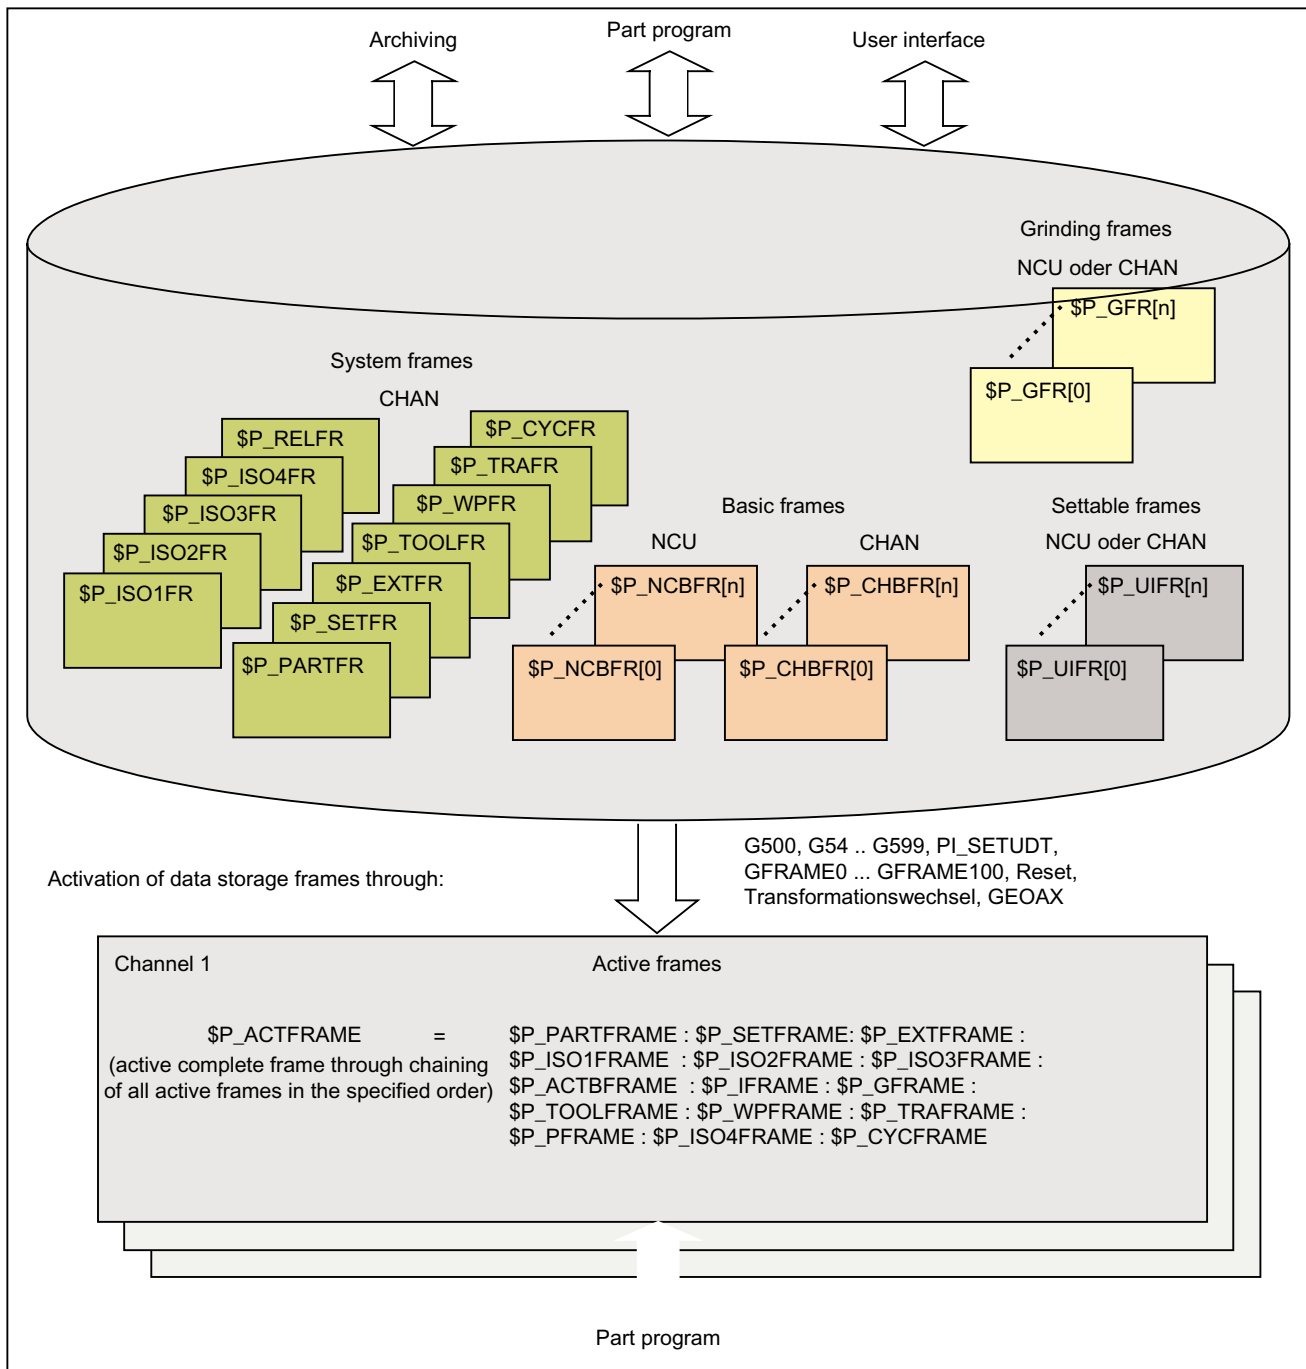

Figure 6-1 Overview of the frame variables

6.1.1 Predefined frame variable (\$P_CHBFRAME, \$P_IFRAME, \$P_PFRAME, \$P_ACTFRAME)

Active: channel-specific base frames \$P_CHBFRAME[<n>] (\$P_BFRAME)

Note

The current base frame `$P_BFRAME` and the data storage base frame `$P_UBFR` are retained for compatibility reasons.

- `$P_BFRAME` \square `$P_CHBFRAME[0]`
- `$P_UBFR` \square `$P_CHBFR[0]`.

The frame variables `$P_CHBFRAME[<n>]` define the reference between the basic coordinate system (BCS) and the basic origin system (BOS).

If the current channel-specific base frame `$P_CHBFRAME[<n>]` should be active immediately in the NC program, the following possibilities are available.

- Commands:
 - G500 (deactivate all settable frames, the base frames remain active)
 - G54 to G599 (settable zero offsets)
- Assignment of a channel-specific base frames of the data storage to a current channel-specific base frame:

$$\text{\$P_CHBFRAME[<n>]} = \text{\$P_CHBFR[<m>]}$$

Active: Channel-specific settable frame \$P_IFRAME

The frame variable `$P_IFRAME` defines the reference between the basic origin system (BOS) and the settable zero system (SZS).

- `$P_IFRAME` corresponds to `$P_UIFR[$P_IFRNUM]`
- After G54 is programmed, for example, `$P_IFRAME` contains the translation, rotation, scaling and mirroring defined by G54.

Active: Channel-specific programmable frame $\$P_PFRAME$

The $\$P_PFRAME$ frame variable defines the reference between the settable zero system (SZS) and the workpiece coordinate system (WCS).

$\$P_PFRAME$ contains the resulting frame, that results

- From the programming of TRANS/ATRANS, ROT/AROT, SCALE/ASCALE, MIRROR/AMIRROR or
- From the assignment of CTRANS, CROT, CMIRROR, CSCALE to the programmed FRAME

Active: Total frame $\$P_ACTFRAME$

The total frame active in the channel results from the chaining of all frames acting in the channel.

```
$P_ACTFRAME =  $P_PARTFRAME : $P_SETFRAME : $P_EXTFRAME :
                $P_ISO1FRAME : $P_ISO2FRAME : $P_ISO3FRAME :
                $P_ACTBFRAME : $P_IFRAME : $P_GFRAME :
                $P_TOOLFRAME : $P_WPFRAME : $P_TRAFRAME :
                $P_PFRAME      : $P_ISO4FRAME : $P_CYCFRAME
```

$\$P_ACTFRAME$ describes the currently valid workpiece coordinate system.

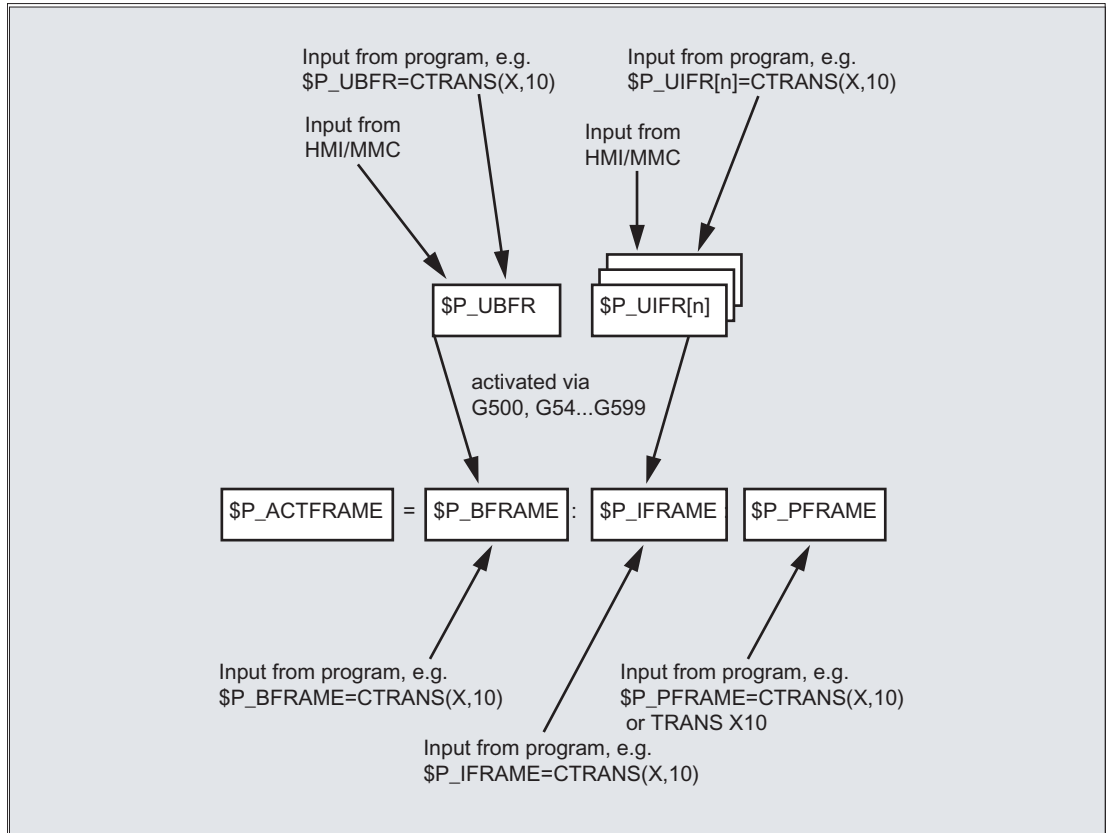

Figure 6-2 Frame variable \$P_ACTFRAME

If one of the following frames \$P_BFRAME / \$P_CHBFRAME [<n>], \$P_IFRAME or \$P_PFRAME is changed, the current total frame \$P_ACTFRAME is recalculated.

Basic frame and settable frame are effective after Reset if MD 20110 RESET_MODE_MASK is set as follows:

Bit0=1, bit14=1 --> \$P_UBFR (basic frame) acts

Bit0=1, bit5=1 --> \$P_UIFR [\$P_UIFRNUM] (settable frame) acts

Data storage: channel-specific base frames \$P_CHBFR[<n>]

The frame variables \$P_CHBFR[<n>] read/write the base frames in the data storage. The data storage frame is not immediately active in the channel when written. The written frame is activated with:

- Channel reset and MD20110 \$MC_RESET_MODE_MASK, Bit0 == 1 and Bit14 == 1
- Command G500, G54 ... G57, G505 ... G599 (activation/deactivation of base frames with subsequent recalculation of the current total frames)

Data storage: Channel-specific settable frames \$P_UIFR[<n>]

The frame variables \$P_UIFR[<n>] read/write the settable base frames in the data storage. The frame is not immediately active in the channel when written. The written frame in the channel is calculated with:

- G500 command (deactivate all settable frames or zero offsets)
- G54 ... G57, G505 ... G599 command (activate a settable frame or zero offset)

Active settable frame	Data storage frame	(corresponds to command)
\$P_IFRAME =	\$P_UIFR[0]	G500
	\$P_UIFR[1]	G54
	\$P_UIFR[2]	G55
	\$P_UIFR[3]	G56
	\$P_UIFR[4]	G57
	\$P_UIFR[5]	G505
	\$P_UIFR[6]	G506

	\$P_UIFR[99]	G599

6.2 Value assignments to frames

6.2.1 Assigning direct values (axis value, angle, scale)

You can directly assign values to frames or frame variables in the NC program.

Syntax

Syntax

```
$P_PFRAME = CTRANS(X, <offset value>, Y, <offset value>, Z, <offset value>, ...)
```

```
$P_PFRAME = ROT(X, <angle>, Y, <angle>, Z, <angle>, ...)
```

```
$P_UIFR[...] = CROT(X, <angle>, Y, <angle>, Z, <angle>, ...)
```

```
$P_PFRAME = CSCALE(X, <scale>, Y, <scale>, Z, <scale>, ...)
```

```
$P_PFRAME = CMIRROR(X, Y, Z)
```

The syntax for \$P_CHBFRAME [<n>] is identical to \$P_PFRAME.

Meaning

CTRANS:	Translation of specified axes
CROT:	Rotation around specified axes
CSCALE:	Scale change on specified axes
CMIRROR:	Direction reversal on specified axis
X, Y, Z:	Offset value in the direction of the specified geometry axis
<offset value>:	Offset value
<angle>:	The angle with the rotation
<scale>:	Scale value

Examples

Value assignments to frame components of the current programmable frame

Value assignment to the translation, rotation and mirror frame components of the current programmable frame:

```
$P_PFRAME = CTRANS(X,10,Y,20,Z,5) : CROT(Z,45) : CMIRROR(Y)
```

Writing the rotation components of a frame

Assignment of values to all three axes of the rotation component of the settable data storage frame `$P_UIFR` with `CROT` :

```
$P_UIFR[5] = CROT(X, 0, Y, 0, Z, 0)
```

Alternatively, the direct assignment of the individual values to the associated axis of the rotation component of the data storage frame:

```
$P_UIFR[5, Y, RT]=0
$P_UIFR[5, X, RT]=0
$P_UIFR[5, Z, RT]=0
```

Description

The chaining operator : combines several operations on a frame with each other. The operations are processed successively from left to right.

Example

Chained operations on `$P_PFRAME` with offset, rotation and scaling:

```
$P_PFRAME = CTRANS(...) : CROT(...) : CSCALE...
```

6.2.2 Reading and changing frame components (TR, FI, RT, SC, MI)

This feature allows you to access **individual** data of a frame, e.g. a specific offset value or angle of rotation. You can modify these values or assign them to another variable.

Syntax

`R10=$P_UIFR[$P_UIFNUM,X,RT]`

Assign the angle of rotation RT around the X axis from the currently valid settable zero offset \$P_UIFR-
NUM to the variable R10.

`R12=$P_UIFR[25,Z,TR]`

Assign the offset value TR in Z from the data set of set frame no. 25 to the variable R12.

`R15=$P_PFRAME[Y,TR]`

Assign the offset value TR in Y of the current programmable frame to the variable R15.

`$P_PFRAME[X,TR] = 25`

Modify the offset value TR in X of the current programmable frame. X25 applies immediately.

Meaning

\$P_UIFRNUM:	This command automatically establishes the reference to the currently valid settable zero offset.
P_UIFR[n,...,]:	Specify the frame number n to access the settable frame no. n.
	Specify the component to be read or modified:
TR:	TR Translation
FI:	FI Translation Fine
RT:	RT Rotation
SC:	SC Scale scale modification
MI:	MI Mirroring
X, Y, Z:	The corresponding axis X, Y, Z is also specified (see examples).

Value range for RT rotation

Rotation around 1st geometry axis: -180° to $+180^{\circ}$

Rotation around 2nd geometry axis: -90° to $+90^{\circ}$

Rotation around 3rd geometry axis: -180° to $+180^{\circ}$

Description

Calling frame

By specifying the system variable `$P_UIFRNUM` you can access the current zero offset set with `$P_UIFR` or `G54`, `G55`, ...

(`$P_UIFRNUM` contains the number of the currently set frame).

All other stored settable `$P_UIFR` frames are called up by specifying the appropriate number `$P_UIFR[n]`.

For predefined frame variables and user-defined frames, specify the name, e.g. `$P_IFRAME`.

Calling data

The axis name and the frame component of the value you want to access or modify are written in square brackets, e.g. `[X, RT]` or `[Z, MI]`.

6.2.3 Calculating with frames

A frame can be assigned to another frame or frames can be chained to each other in the NC program.

Frame chainings are suitable for the description of several workpieces, arranged on a pallet, which are to be machined in the same process.

The frame components can only contain intermediate values for the description of pallet tasks. These are chained to generate various workpiece zeroes.

Examples

Assignments

Program code	Comment
DEF FRAME SETTING_1	; Definition of a local frame variable
SETTING_1 = CTRANS(X,10)	; Assignment of the function result to the frame variable
\$P_PFRAME = SETTING_1	; Assignment of the frame variable to the current frame
DEF FRAME SETTING_4	; Definition of a local frame variable
SETTING_4 = \$P_PFRAME	; Buffer the current frame in the frame variable
...	
\$P_PFRAME = SETTING_4	; Fetch the current frame from the frame variable

Chainings

The operator : chains frames with each other in the programmed sequence. The frame components, such as offsets and rotations, are executed successively additive.

Program code	Comment
\$P_IFRAME = \$P_UIFR[15] :	; Assignment of the result frame from the chaining of the
\$P_UIFR[16]	; two settable data storage frames on the active
	; settable total frame.
	; Application example:
	; \$P_UIFR[15]: Offset
	; \$P_UIFR[16]: Rotation
\$P_UIFR[3] = \$P_UIFR[4] :	; Assignment of the result frame from the chaining of the
\$P_UIFR[5]	; two settable data storage frames on a
	; different settable data storage frame

6.2.4 Definition of frame variables (DEF FRAME)

In addition to the predefined frame variables, user frame variables can also be defined. The user-defined frame variables are user variables of type FRAME. The name of the frame can be assigned freely in accordance with the rules for user variables.

The CTRANS, CROT, CSCALE and CMIRROR functions assign values to user-defined frame variables.

Syntax

```
DEF FRAME <name>
```

Meaning

DEF FRAME:	Define user variable of the type FRAME.
<name>:	Name of the frame variable

Example

Definition of a "PALETTE" frame variable and the assignment of offset and rotation values:

Program code	Comment
DEF FRAME PALETTE	; Define PALETTE frame variable
PALETTE = CTRANS(...) : CROT(...)	; Assignment of the result frame of the chaining for
	; offset and rotation on the PALETTE frame variable

6.3 Coarse and fine offsets (CTTRANS, CFINE)

Fine offset

A fine offset `CFINE (. . .)` can be applied to the following frames:

- Settable frames: `$P_UIFR` or `$P_IFRAME`
- Basic frames: `$P_NCBFR[<n>]`, `$P_CHBFR[<n>]`, `$P_CHBFRAMES[<n>]` or `$P_ACTBFRAME`
- Programmable frame: `$P_PFRAME`

The fine offset of a frame is programmed with the `CFINE (. . .)` command.

Coarse offset

A coarse offset `CTTRANS (. . .)` can be applied to all frames.

Total offset

The total offset results from the addition of the coarse and the fine offset.

Machine data

Enable of the fine offset

The fine offset is enabled with the machine data:

MD18600 `$MN_MM_FRAME_FINE_TRANS = 1`

Syntax

Fine offset

- Complete frame
 - `<frame> = CFINE (<K_1>, <value>)`
 - `<frame> = CFINE (<K_1>, <value>, <K_2>, <value>)`
 - `<frame> = CFINE (<K_1>, <value>, <K_2>, <value>, <K_3>, <value>)`
- Frame component
 - `<frame>[<n>, <K_1>, FI] = <value>`

Coarse offset

- Complete frame
 - `<frame> = CTRANS (<K_1>, <value>)`
 - `<frame> = CTRANS (<K_1>, <value>, <K_2>, <value>)`
 - `<frame> = CTRANS (<K_1>, <value>, <K_2>, <value>, <K_3>, <value>)`
- Frame component
 - `<frame>[<n>, <K_1>, TR] = <value>`

6.3 Coarse and fine offsets (CTrans, CFine)

In particular for the programmable frame \$P_PFRAME:

- TRANS <K_1> <value>
- TRANS <K_1> <value> <K_2> <value>
- TRANS <K_1> <value> <K_2> <value> <K_3> <value>

Meaning

<Frame>:	Frame, e.g. settable frame of the data storage \$P_UIFR[<n>]
CFINE:	Fine offset, additive offset.
CTrans:	Coarse offset, absolute offset.
TRANS:	Only programmable frame: Coarse offset, absolute offset.
<K_n>:	Coordinate axes X, Y, Z
<value>:	Offset value

6.4 External zero offset (\$AA_ETRANS)

The external zero offset is a linear offset between the base coordinate system (BCS) and the basic origin system (BOS).

The external zero offset with \$AA_ETRANS acts in two ways depending on the machine data parameterization:

1. After activation by the NC/PLC interface signal, the system variable \$AA_ETRANS acts directly as offset value
2. After activation by the NC/PLC interface signal, the value of the system variable \$AA_ETRANS is transferred to the active system frames \$P:EXTFRAME and the data storage frame \$P_EXTFR. The active total frame \$P_ACTFRAME is then recalculated.

Machine data

In conjunction with the system variable \$AA_ETRANS, a differentiation is made between two procedures selected with the following machine data:

MD28082 \$MC_MM_SYSTEM_FRAME_MASK, Bit1 = <value>

<value>	Meaning
0	Function: \$AA_ETRANS[<axis>] written directly by PLC, HMI or NC program. Enable for retraction of the zero offset for \$AA_ETRANS[<axis>] in the next possible traversing block: DB31, ... DBX3.0
1	Function: Activation of the active system frame \$P:EXTFRAME and the data storage frame \$P_EXTFR Enable for retraction of the zero offset for \$AA_ETRANS[<axis>] by: DB31, ... DBX3.0. The following is performed in the channel: <ul style="list-style-type: none"> • Stop all traversal movements in the channel (other than command and PLC axes) • Preprocessing stop with subsequent reorganization (STOPRE) • Coarse offset of active frame \$P_EXTFRAME[<axis>] = \$AA_ETRANS[<axis>] • Coarse offset of data storage frame \$P_EXTFR[<axis>] = \$AA_ETRANS[<axis>] • Recalculation of the active total frame \$P_ACTFRAME • Retraction of the offset in the programmed axes. • Continuation of the interrupted traversing motion or of the NC program

6.4 External zero offset (\$AA_ETRANS)

Programming

- Syntax
`$AA_ETRANS[<axis>] = <value>`
- Meaning

<code>\$AA_ETRANS:</code>	System variable for buffering the external zero offset
<code><axis>:</code>	Channel axis
<code><value>:</code>	Offset value

NC/PLC interface signal

`DB31, ... DBX3.0 = 0 → 1 ⇒ $P_EXTFRAME[<axis>] = $P_EXTFR[<axis>] = $AA_ETRANS[<axis>]`

6.5 Set actual value with loss of the referencing status (PRESETON)

The `PRESETON()` procedure sets for one or more axes a new actual value in the machine coordinate system (MCS). This corresponds to a zero offset of the MCS of the axis. This does not cause the axis to be traversed.

`PRESETON` initiates a preprocessing stop with synchronization. The actual position is assigned to the axis only at standstill.

If the axis for `PRESETON` is not assigned to the channel, the further procedure depends on the axis-specific configuring of the axis replacement behavior:

MD30552 \$MA_AUTO_GET_TYPE

Referencing status

By setting a new actual value in the machine coordinate system, the referencing status of the machine axis is reset:

DB31, ... DBX60.4/.5 = 0 (referenced / synchronized measuring system 1/2)

For this reason it is recommended that `PRESETON` only be used for axes that do not require a reference point.

To restore the original machine coordinate system, the measuring system of the machine axis must be referenced again, e.g. through active referencing from the part program (G74).

CAUTION

Loss of the referencing status

The setting of a new actual value in the machine coordinate system with `PRESETON` resets the referencing status of the machine axis to "not referenced / synchronized".

Programming

Syntax

```
PRESETON(<axis_1>, <value_1> [, <axis_2>, <value_2>, ... <axis_8>,
<value_8>])
```

Meaning

PRESETON:	Set actual value with loss of the referencing status	
	Preprocessing stop:	yes
	Alone in the block:	yes
<axis_x>:	Machine axis name	
	Type:	AXIS
	Range of values:	Machine axis names defined in the channel
<value_x>:	New actual value of the machine axis in the machine coordinate system (MCS) The input is made in the currently valid measuring system (inch/metric) An active diameter programming (<code>DIAMON</code>) is considered	
	Type:	REAL

References

PRESETONS in NC programs

A detailed description of PRESETON in NC programs is contained in:

Function Manual Basic Functions, Chapter "K2: Axes, coordinate systems, frames" > "Coordinate systems" > "Machine coordinate system (MCS)" > "Set actual value with loss of the referencing status (PRESETON)"

PRESETONS in synchronous actions

A detailed description of PRESETON in synchronous actions is contained in:

Function Manual, Synchronized Actions; Section: "Detailed description" > "Actions in synchronous actions" > "Set actual value with loss of the referencing status (PRESETON)"

6.6 Set actual value without loss of the referencing status (PRESETONS)

The `PRESETONS()` procedure sets for one or more axes a new actual value in the machine coordinate system (MCS). This corresponds to a zero offset of the MCS of the axis. This does not cause the axis to be traversed.

`PRESETONS` initiates a preprocessing stop with synchronization. The actual position is assigned to the axis only at standstill.

If the axis for `PRESETONS` is not assigned to the channel, the further procedure depends on the axis-specific configuring of the axis replacement behavior:

MD30552 \$MA_AUTO_GET_TYPE

Referencing status

The setting of a new actual value in the machine coordinate system (MCS) with `PRESETONS` does **not** change the referencing status of the machine axis.

Requirements

- **Encoder type**

`PRESETONS` is possible only for the following encoder types of the active measuring system:

- MD30240 \$MA_ENC_TYPE[<measuring system>] = 0 (simulated encoder)
- MD30240 \$MA_ENC_TYPE[<measuring system>] = 1 (raw signal encoder)

- **Referencing mode**

`PRESETONS` is possible only for the following referencing modes of the active measuring system:

- MD34200 \$MA_ENC_REFP_MODE[<measuring system>] = 0 (no reference point approach possible)
- MD34200 \$MA_ENC_REFP_MODE[<measuring system>] = 1 (referencing for incremental, rotary or linear measuring systems: Zero pulse on the encoder track)

Programming

Syntax

`PRESETONS(<axis_1>, <value_1> [, <axis_2>, <value_2>, ... <axis_8>, <value_8>])`

Meaning

PRESETONS:	Set actual value without loss of the referencing status	
	Preprocessing stop:	yes
	Alone in the block:	yes
<axis_x>:	Machine axis name	
	Type:	AXIS
	Range of values:	Machine axis names defined in the channel

6.6 Set actual value without loss of the referencing status (PRESETONS)

<value_x>:	New current actual value of the machine axis in the machine coordinate system (MCS) The input is made in the active measuring system (inch/metric) An active diameter programming (DIAMON) is considered	
	Type:	REAL

6.7 Frame calculation from three measuring points in space (MEAFRAME)

The MEAFRAME function is used to support measuring cycles. It calculates the frame from three ideal points and the corresponding measured points.

When a workpiece is positioned for machining, its position relative to the Cartesian machine coordinate system is generally both offset and rotated in relation to its ideal position. For exact machining or measuring either a costly physical adjustment of the part is required or the motions defined in the part program must be changed.

A frame can be defined by sampling three points in space whose ideal positions are known. A touch-trigger probe or optical sensor is used for sampling that touches special holes precisely fixed on the supporting plate or probe balls.

Syntax

MEAFRAME(<ideal points>,<measuring points>,<quality>)

Meaning

MEAFRAME:	Function call		
<ideal points>:	2-dim. REAL array containing the three coordinates of the ideal points		
<measuring points>:	2-dim. REAL array containing the three coordinates of the measured points		
<quality>:	Variable with which information on the quality of the FRAME calculation is returned		
	Type:	VAR REAL	
	Value:	-1	The ideal points are almost on a straight line: The frame could not be calculated. The returned FRAME variable contains a neutral frame.
		-2	The measuring points are almost on a straight line: The frame could not be calculated. The returned FRAME variable contains a neutral frame.
		-4	The calculation of the rotation matrix failed for a different reason.
		≥ 0.0	Sum of distortions (distances between the points), that are required to transform the measured triangle into a triangle that is congruent to the ideal triangle.

Note

Quality of the measurement

In order to map the measured coordinates onto the ideal coordinates using a rotation and a translation, the triangle formed by the measured points must be congruent to the ideal triangle. This is achieved by means of a compensation algorithm that minimizes the sum of squared deviations needed to reshape the measured triangle into the ideal triangle.

Since the effective distortion can be used to judge the quality of the measurement, MEAFRAME returns it as an additional variable.

Note

The frame created by MEAFRAME can be transformed by the ADDFRAME function into another frame in the frame chain (see example "Chaining with ADDFRAME").

Examples

Example 1:
Part program 1:

Program code
...
DEF FRAME CORR_FRAME

Setting measuring points:

Program code	Comment
DEF REAL IDEAL_POINT[3,3]= SET(10.0,0.0,0.0,0.0,10.0,0.0,0.0,0.0,10.0)	
DEF REAL MEAS_POINT[3,3]= SET(10.1,0.2,-0.2,-0.2,10.2,0.1,-0.2,0.2,9.8)	; For test.
DEF REAL FIT_QUALITY=0	
DEF REAL ROT_FRAME_LIMIT=5	; Permits max. five degree rotation of the part position.
DEF REAL FIT_QUALITY_LIMIT=3	; Permits max. three mm offset between the ideal and the measured triangle.
DEF REAL SHOW_MCS_POS1[3]	
DEF REAL SHOW_MCS_POS2[3]	
DEF REAL SHOW_MCS_POS3[3]	

Program code	Comment
N100 G01 G90 F5000	
N110 X0 Y0 Z0	
N200 CORR_FRAME=MEAFRAME(IDEAL_POINT,MEAS_POINT,FIT_QUALITY)

N630 SHOW_MCS_POS3[2]=\$AA_IM[Z]	
N700 G500	; Deactivate settable frame as with zero frame (no value entered, pre-assigned).
No_FRAME	; Deactivate settable frame, as pre-assigned with zero frame (no value entered).
M0	
M30	

Example 2: Chaining of frames**Chaining of MEAFRAME for offsets**

The MEAFRAME function returns an offset frame. If this offset frame is chained to the settable frame \$P_UIFR[1] that was active during the call of the function (e.g. G54), a settable frame is provided for further conversions for the traversing or machining.

Chaining with ADDFRAME

6.7 Frame calculation from three measuring points in space (MEAFRAME)

If you want this offset frame in the frame chain to apply at a different position or if other frames are active before the settable frame, the ADDFRAME function can be used for chaining into one of the channel basic frames or a system frame.

The following must not be active in the frames:

- Mirroring with MIRROR
- Scaling with SCALE

The input parameters for the setpoints and actual values are the workpiece coordinates. These coordinates must always be specified metrically or in inches (G71/G70) and radius-related (DIAMOF) in the basic system of the control.

References:

For further information on ADDFRAME, see:

Function Manual, Basic Functions; K2: Axis Types, Coordinate Systems, Frames

6.8 NCU global frames

Only one set of NCU global frames is used for all channels on each NCU. NCU global frames can be read and written from all channels. The NCU global frames are activated in the respective channel.

Channel axes and machine axes with offsets can be scaled and mirrored by means of global frames.

Geometrical relationships and frame chains

With global frames there is no geometrical relationship between the axes. It is therefore not possible to perform rotations or program geometry axis identifiers.

- Rotations cannot be used on global frames. The programming of a rotation is denied with alarm: "18310 Channel %1 Block %2 Frame: rotation not allowed" is displayed.
- It is possible to chain global frames and channel-specific frames. The resulting frame contains all frame components including the rotations for all axes. The assignment of a frame with rotation components to a global frame is denied with alarm "Frame: rotation not allowed".

NCU global frames

NCU global basic frames \$P_NCBFR[n]

Up to eight NCU global basic frames can be configured:

Channel-specific basic frames can also be available.

Global frames can be read and written from all channels of an NCU. When writing global frames, the user must ensure channel coordination. This can be implemented, for example, through wait markers (WAITMC).

Machine manufacturer

The number of global basic frames is configured via the machine data.

References:

Function Manual, Basic Functions; Axes, Coordinate Systems, Frames (K2)

NCU global settable frames \$P_UIFR[n]

All settable frames G500, G54...G599 can be configured NCU-globally or channel-specifically.

Machine manufacturer

All settable frames can be reconfigured as global frames with the aid of machine data MD18601 \$MN_MM_NUM_GLOBAL_USER_FRAMES.

Channel axis identifiers and machine axis identifiers can be used as axis identifiers in frame program commands. Programming the geometry identifiers is rejected with an alarm.

6.8.1 Channel-specific frames (\$P_CHBFR, \$P_UBFR)

Settable frames or basic frames can be read and written via the part program and via the OPI by the operator and by the PLC.

The fine offset can also be used for global frames. Suppression of global frames also takes place, as is the case with channel-specific frames, via G53, G153, SUPA and G500.

Machine manufacturer

The number of basic frames can be configured in the channel via the machine data MD28081 \$MC_MM_NUM_BASE_FRAMES. The standard configuration is designed for at least one basic frame per channel. A maximum of eight basic frames are supported per channel. In addition to the eight basic frames, there can also be eight NCU global basic frames in the channel.

Channel-specific frames

\$P_CHBFR[n]

System variable \$P_CHBFR[n] can be used to read and write the basic frames. When a basic frame is written, the chained total basic frame is not activated until the execution of a G500, G54...G599 statement. The variable is used primarily for storing write operations to the basic frame on HMI or PLC. These frame variables are saved by the data backup.

First basic frame in the channel

The basic frame with array index 0 is not activated simultaneously when writing to the predefined \$P_UBFR variable, but rather activation only takes place on execution of a G500, G54...G599 statement. The variable can also be read and written in the program.

\$P_UBFR

\$P_UBFR is identical to \$P_CHBFR[0]. One basic frame always exists in the channel by default, so that the system variable is compatible with older versions. If there is no channel-specific basic frame, an alarm is issued at read/write: "Frame: statement not permissible".

6.8.2 Frames active in the channel

Frames active in the channel are entered from the part program via the relevant system variables of these frames. This also includes system frames. The current system frame can be read and written in the part program via these system variables.

Frames currently active in the channel

Overview

Current system frames

\$P_PARTFRAME

\$P_SETFRAME

\$P_EXTFRAME

\$P_NCBFRAME[n]

\$P_CHBFRAME[n]

\$P_BFRAME

For:

TCARR and PAROT

Preset actual value memory and scratching

External zero offset

Current NCU global basic frames

Current channel basic frames

Current first basic frame in the channel

\$P_ACTBFRAME	Complete basic frame
\$P_CHBFRMASK and \$P_NCBFRMASK	Complete basic frame
\$P_IFRAME	Current settable frame
Current system frames	For:
\$P_TOOLFRAME	TOROT and TOFRAME
\$P_WPFRAME	Workpiece reference points
\$P_TRAFRAME	Transformations
\$P_PFRAME	Current programmable frame
Current system frame	For:
\$P_CYCFRAME	Cycles
P_ACTFRAME	Current total frame
FRAME chaining	Current frame is made up of the complete basic frame

\$P_NCBFRAME [n] Current NCU global basic frames

System variable `$P_NCBFRAME[n]` can be used to read and write the current global basic frame field elements. The resulting total basic frame is calculated by means of the write process in the channel.

The modified frame is activated only in the channel in which the frame was programmed. If the frame is to be modified for all channels of an NCU, `$P_NCBFR[n]` and `$P_NCBFRAME[n]` must be written simultaneously. The other channels must then activate the frame, e.g. with G54. Whenever a basic frame is written, the complete basic frame is calculated again.

\$P_CHBFRAME[n] Current channel basic frames

System variable `$P_CHBFRAME[n]` can be used to read and write the current channel basic frame field elements. The resulting complete basic frame is calculated by means of the write process in the channel. Whenever a basic frame is written, the complete basic frame is calculated again.

\$P_BFRAME Current first basic frame in the channel

The predefined frame variable `$P_BFRAME` can be used to read and write the current basic frame with the array index 0, which is valid in the channel, in the part program. The written basic frame is immediately included in the calculation.

`$P_BFRAME` is identical to `$P_CHBFRAME[0]`. The system variable always has a valid default value. If there is no channel-specific basic frame, an alarm is issued at read/write: "Frame: statement not permissible".

\$P_ACTBFRAME Complete basic frame

The `$P_ACTFRAME` variable determines the chained complete basic frame. The variable is read-only.

`$P_ACTFRAME` corresponds to:

`$P_NCBFRAME[0] : ... : $P_NCBFRAME[n] : $P_CHBFRAME[0] : ... : $P_CHBFRAME[n]`.

$\$P_CHBFRMASK$ and $\$P_NCBFRMASK$ Complete basic frame

The user can select which basic frames are to be included in the calculation of the "Complete" basic frame via the system variables $\$P_CHBFRMASK$ and $\$P_NCBFRMASK$. The variables can only be programmed in the program and read via the OPI. The value of the variable is interpreted as a bit mask and specifies which basic frame field element of $\$P_ACTFRAME$ is to be included in the calculation.

$\$P_CHBFRMASK$ can be used to specify which channel-specific basic frames and $\$P_NCBFRMASK$ can be used to specify which NCU global basic frames are to be included in the calculation.

The complete basic frame and the complete frame are recalculated with the programming of the variables. After a reset and in the basic setting, the values of $\$P_CHBFRMASK$ and $\$P_NCBFRMASK$ are as follows:

$\$P_CHBFRMASK = \$MC_CHBFRAME_RESET_MASK$

$\$P_NCBFRMASK = \$MC_CHBFRAME_RESET_MASK$

Example:

$\$P_NCBFRMASK = 'H81' ; \$P_NCBFRAME[0] : \$P_NCBFRAME[7]$

$\$P_CHBFRMASK = 'H11' ; \$P_CHBFRAME[0] : \$P_CHBFRAME[4]$

$\$P_IFRAME$ Current settable frame

The predefined frame variable $\$P_IFRAME$ can be used to read and write the current settable frame, which is valid in the channel, in the part program. The written settable frame is immediately included in the calculation.

In the case of NCU global settable frames, the modified frame acts only in the channel in which the frame was programmed. If the frame is to be modified for all channels of an NCU, $\$P_UIFR[n]$ and $\$P_IFRAME$ must be written simultaneously. The other channels must then activate the corresponding frame, e.g. with G54.

\$P_PFRAME Current programmable frame

\$P_PFRAME is the programmable frame that results from the programming of TRANS/ATRANS, G58/G59, ROT/AROT, SCALE/ASCALE, MIRROR/AMIRROR or from the assignment of CTRANS, CROT, CMIRROR, CSCALE to the programmable frame.

Current, programmable frame variable that establishes the reference between the settable zero system (SZS) and the workpiece coordinate system (WCS).

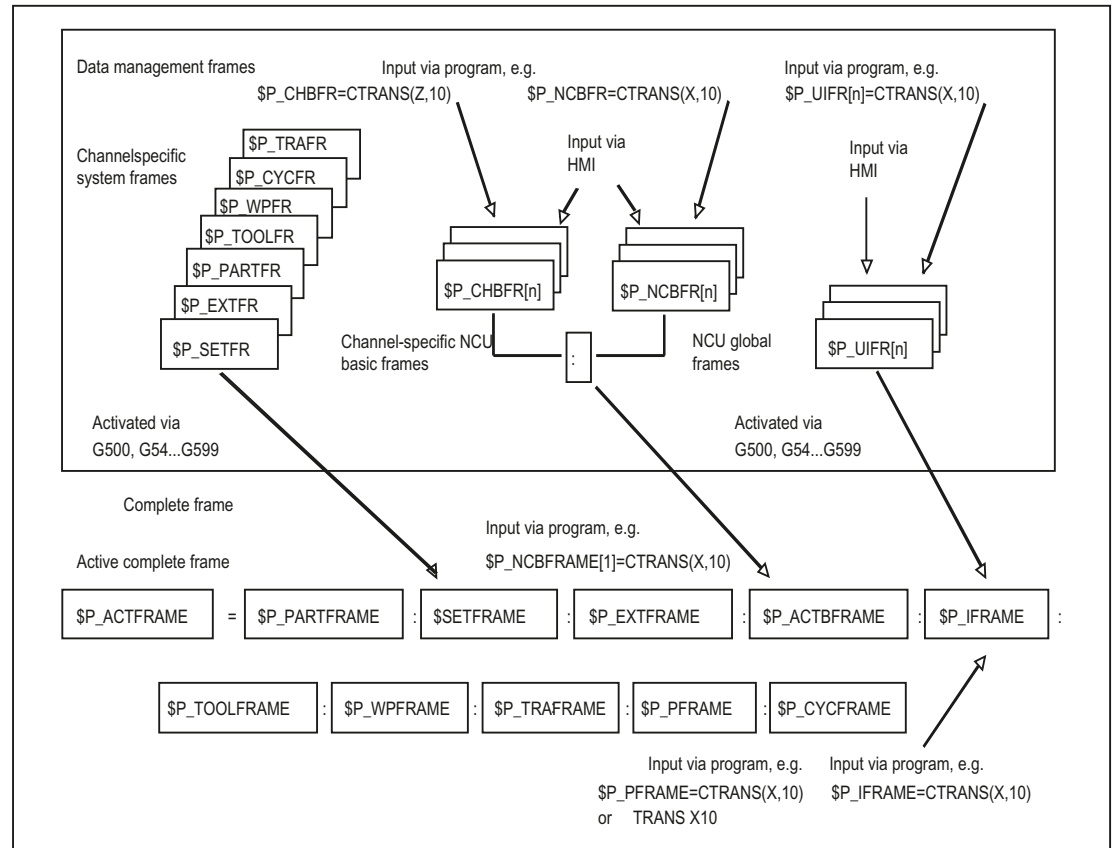

P_ACTFRAME Current complete frame

The resulting current complete frame \$P_ACTFRAME is now a chain of all basic frames, the current settable frame and the programmable frame. The current frame is always updated whenever a frame component is changed.

\$P_ACTFRAME corresponds to:

\$P_PARTFRAME : \$P_SETFRAME : \$P_EXTFRAME : \$P_ACTBFRAME : \$P_IFRAME :

\$P_TOOLFRAME : \$P_WPFRAME : \$P_TRAFRAME : \$P_PFRAME : \$P_CYCFRAME

Frame chaining

The current frame is composed of the complete basic frame, the settable frame, the system frame and the programmable frame in accordance with the current complete frame specified above.

Transformations

7.1 General programming of transformation types

General function

You can choose to program transformation types with suitable parameters in order to adapt the controller to various machine kinematics. These parameters can be used to declare both the orientation of the tool in space and the orientation movements of the rotary axes accordingly for the selected transformation.

In three-, four-, and five-axis transformations, the programmed positional data always relates to the tip of the tool, which is tracked orthogonally to the machined surface in space. The Cartesian coordinates are converted from the basic coordinate system to the machine coordinate system and relate to the geometry axes. These describe the operating point. Virtual rotary axes describe the orientations of the tool in space and are programmed with TRAORI.

In the case of kinematic transformation, positions can be programmed in the Cartesian coordinate system. The controller maps the Cartesian coordinate system traversing movements programmed with TRANSMIT, TRACYL and TRAANG to the traversing movements of the real machine axes.

Programming

Three, four and five axis transformations (TRAORI)

The orientation transformation declared is activated with the TRAORI command and the three possible parameters for transformation number, orientation vector and rotary axis offsets.

```
TRAORI(transformation number, orientation vector, rotary axis
offsets)
```

Kinematic transformations

TRANSMIT(transformation number) declared transformations are examples of kinematic transformation.

```
TRACYL(working diameter, transformation number)
```

```
TRAANG(angle of offset axis, transformation number)
```

Deactivate active transformation

TRAFOOF can be used to deactivate the currently active transformation.

Orientation transformation

Three, four and five axis transformations (TRAORI)

For the optimum machining of surfaces configured in space in the working area of the machine, machine tools require other axes in addition to the three linear axes X, Y and Z. The additional

7.1 General programming of transformation types

axes describe the orientation in space and are called orientation axes in subsequent sections. They are available as rotary axes on four types of machine with varying kinematics.

1. Two-axis swivel head, e.g. cardanic tool head with one rotary axis parallel to a linear axis on a fixed tool table.
2. Two-axis rotary table, e.g. fixed swivel head with tool table, which can rotate about two axes.
3. Single-axis swivel head and single-axis rotary table, e.g. one rotatable swivel head with rotated tool for tool table, which can rotate about one axis.
4. Two-axis swivel head and single-axis rotary table, e.g. on tool table, which can rotate about one axis, and one rotatable swivel head with tool, which can rotate about itself.

3- and 4-axis transformations are special types of 5-axis transformation and are programmed in the same way as 5-axis transformations.

The functional scope of "**generic 3-/4-/5-/6-axis transformation**" is suitable both for transformations for orthogonal rotary axes and transformations for the universal milling head and, like all other orientation transformations, can also be activated for these four machine types with TRAORI. In generic 5-/6-axis transformation, tool orientation has an additional third degree of freedom, whereby the tool can be rotated about its own axis relative to the tool direction so that it can be directed as required in space.

References: /FB3/ Function Manual, Special Functions; 3- to 5-Axis Transformation (F2)

Initial tool orientation setting regardless of kinematics

ORIRESET

If an orientation transformation is active using TRAORI, then ORIRESET can be used to specify the initial settings of up to 3 orientation axes with the optional parameters A, B, C. The order in which the programmed parameters are assigned to the round axes depends on the orientation axis order defined by the transformation. Programming ORIRESET(A, B, C) results in the orientation axes moving in linear and synchronous motion from their current position to the specified initial setting position.

Kinematic transformations

TRANSMIT and TRACYL

For milling on turning machines, either

1. Face machining in the turning clamp with TRANSMIT or
2. Machining of grooves with any path on cylindrical bodies with TRACYL

can be programmed for the transformation declared.

TRAANG

If the option of setting the infeed axis for inclined infeed is required (for grinding technology, for example), TRAANG can be used to program a configurable angle for the transformation declared.

Cartesian PTP travel

Kinematic transformation also includes the so-called "Cartesian PTP travel" for which up to 8 different articulated joint positions STAT= can be programmed. Although the positions are programmed in a Cartesian coordinate system, the movement of the machine occurs in the machine coordinates.

References:

/FB2/ Function Manual, Extended Functions; Kinematic Transformation (M1)

Chained transformations

Two transformations can be switched one after the other. For the second transformation chained here, the motion parts for the axes are taken from the first transformation.

The first transformation can be:

- Orientation transformation TRAORI
- Polar transformation TRANSMIT
- Cylinder transformation TRACYL
- Inclined axis transformation TRAANG

The second transformation must be a TRAANG type transformation for an inclined axis.

7.1.1 Orientation movements for transformations**Travel movements and orientation movements**

The traversing movements of the programmed orientations are determined primarily by the type of machine. For three-, four-, and five-axis type transformations with TRAORI, the rotary axes or pivoting linear axes describe the orientation movements of the tool.

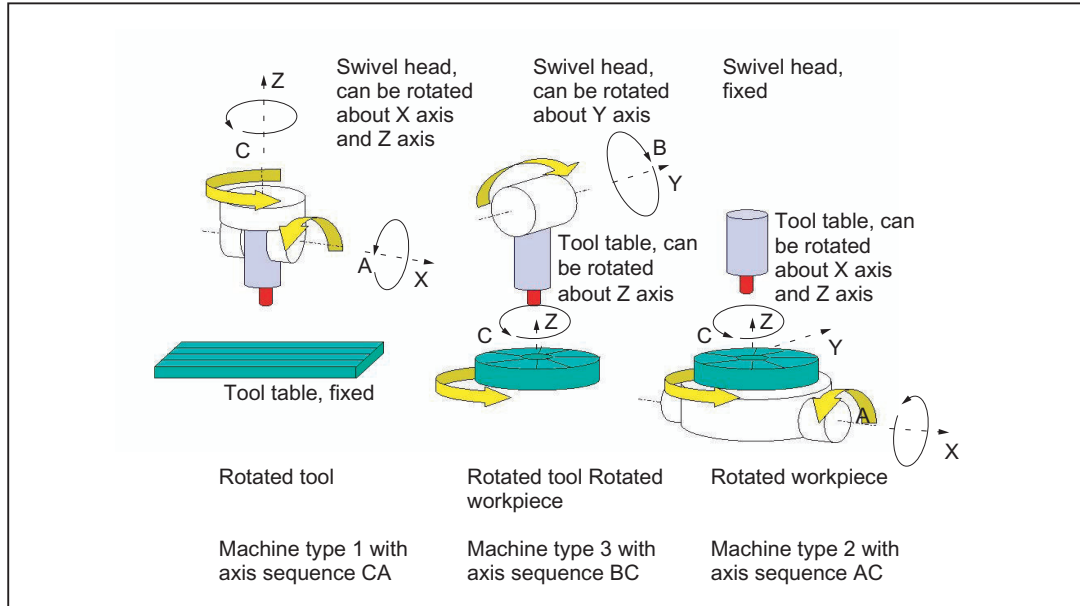

Changes in the position of the rotary axes involved in the orientation transformation will induce compensating movements on the remaining machine axes. The position of the tool tip remains unchanged.

Orientation movements of the tool can be programmed using the rotary axis identifiers A..., B..., C... of the virtual axes as appropriate for the application either by entering Euler or RPY angles or directional or surface normal vectors, normalized vectors for the rotary axis of a taper or for intermediate orientation on the peripheral surface of a taper.

In the case of kinematic transformation with TRANSMIT, TRACYL and TRAANG, the controller maps the programmed Cartesian coordinate system traversing movements to the traversing movements of the real machine axes.

Machine kinematics for three, four and five axis transformation (TRAORI)

Either the tool or the tool table can be rotatable with up to two rotary axes. A combination of swivel head and rotary table (single-axis in each case) is also possible.

Machine type	Programming of orientation
Three-axis transformation machine types 1 and 2	Programming of tool orientation only in the plane, which is perpendicular to the rotary axis. There are two translatory axes (linear axes) and one axis of rotation (rotary axis).
Four-axis transformation machine types 1 and 2	Programming of tool orientation only in the plane, which is perpendicular to the rotary axis. There are three translatory axes (linear axes) and one axis of rotation (rotary axis).
Five-axis transformation machine types 3 Single-axis swivel head and single-axis rotary table	Programming of orientation transformation. Kinematics with three linear axes and two orthogonal rotary axes. The rotary axes are parallel to two of the three linear axes. The first rotary axis is moved by two Cartesian linear axes. It rotates the third linear axis with the tool. The second rotary axis rotates the workpiece.

Generic 5/6-axis transformations

Machine type	Programming of orientation transformation
Generic five/six-axis transformation machine types 4 Two-axis swivel head with tool which rotates around itself and single-axis rotary table	Programming of orientation transformation. Kinematics with three linear axes and three orthogonal rotary axes. The rotary axes are parallel to two of the three linear axes. The first rotary axis is moved by two Cartesian linear axes. It rotates the third linear axis with the tool. The second rotary axis rotates the workpiece. The basic tool orientation can also be programmed with additional rotation of the tool around itself with the THETA rotary angle.

When calling "generic three-, four-, and five/six-axis transformation", the basic orientation of the tool can also be transferred. The restrictions in respect of the directions of the rotary axes no longer apply. If the rotary axes are not exactly vertical to one another or existing rotary axes

are not exactly parallel with the linear axes, "generic five-/six-axis transformation" can provide better results in respect of tool orientation.

Kinematic transformations TRANSMIT, TRACYL and TRAANG

For milling on turning machines or an axis that can be set for inclined infeed during grinding, the following axis arrangements apply by default in accordance with the transformation declared:

TRANSMIT	Activation of polar transformation
Face machining in the turning clamp	A rotary axis An infeed axis vertical to the axis of rotation A longitudinal axis parallel to the axis of rotation

TRACYL	Activation of the cylinder surface transformation
Machining of grooves with any path on cylindrical bodies	A rotary axis An infeed axis vertical to the axis of rotation A longitudinal axis parallel to the axis of rotation

TRAANG	Activation of the inclined axis transformation
Machining with an oblique in-feed axis	A rotary axis An infeed axis with parameterizable angle A longitudinal axis parallel to the axis of rotation

Cartesian PTP travel

The machine moves in machine coordinates and is programmed with:

TRAORI	Activation of transformation
PTP point-to-point traversing	Approach position in Cartesian coordinate system (MCS)
CP	Path motion of Cartesian axes in the BCS
STAT	Position of the articulated joints is dependent on the transformation
TU	The angle at which the axes traverse on the shortest path

PTP transversal with generic 5/6-axis transformation

The machine is moved using machine coordinates and the tool orientation, where the movements can be programmed both using round axis positions and using Euler and/or RPY angle vectors irrespective of the kinematics or the direction vectors.

Round axis interpolation, vector interpolation with large circle interpolation or interpolation of the orientation vector on a peripheral surface of a taper are possible in such cases.

Example: Three- to five-axis transformation on a universal milling head

The machine tool has at least five axes:

- Three translatory axes for movements in straight lines, which move the operating point to any position in the working area.
- Two rotary swivel axes arranged at a configurable angle (usually 45 degrees) allow the tool to swivel to positions in space that are limited to a half sphere in a 45-degree configuration.

7.1.2 Overview of orientation transformation TRAORI

Programming types available in conjunction with TRAORI

Machine type	Programming with active transformation TRAORI

7.2 Three, four and five axis transformation (TRAORI)

7.2.1 General relationships of universal tool head

To obtain optimum cutting conditions when machining surfaces with a three-dimensional curve, it must be possible to vary the setting angle of the tool.

The machine design to achieve this is stored in the axis data.

5-axis transformation

Cardanic tool head

Three linear axes (X, Y, Z) and two orientation axes (C, A) define the setting angle and the operating point of the tool here. One of the two orientation axes is created as an inclined axis, in our example A' - in many cases, placed at 45°.

In the examples shown here, you can see the arrangements as illustrated by the CA machine kinematics with the Cardanic tool head!

Machine manufacturer

The axis sequence of the orientation axes and the orientation direction of the tool can be set up using the machine data as appropriate for the machine kinematics.

In this example, A' lies below the angle ϕ to the X axis.

The following possible relations are generally valid:

A' lies below the angle φ to the	X axis
B' lies below the angle φ to the	Y axis
C' lies below the angle φ to the	Z axis

Angle φ can be configured in the range 0° to $+89^\circ$ using machine data.

With swiveling linear axis

This is an arrangement with a moving workpiece and a moving tool. The kinematics consists of three linear axes (X, Y, Z) and two orthogonally arranged rotary axes. The first rotary axis is moved, for example, over a compound slide of two linear axes, the tool standing parallel to the third linear axis. The second rotary axis turns the workpiece. The third linear axis (swivel axis) lies in the compound slide plane.

The axis sequence of the rotary axes and the orientation direction of the tool can be set up using the machine data as appropriate for the machine kinematics.

There are the following possible relationships:

Axes:	Axis sequences:
1. rotary axis	A A B B C C
2. rotary axis	B C A C A B
Swiveled linear axis	Z Y Z X Y X

For more detailed information about configurable axis sequences for the orientation direction of the tool, see

References: /FB3/ Function Manual, Special Functions; 3- to 5-Axis Transformations (F2), Section Universal milling head, "Parameterization".

7.2.2 Three, four and five axis transformation (TRAORI)

The user can configure two or three translatory axes and one rotary axis. The transformations assume that the rotary axis is orthogonal on the orientation plane.

Orientation of the tool is possible only in the plane perpendicular to the rotary axis. The transformation supports machine types with movable tool and movable workpiece.

Three- and four-axis transformations are configured and programmed in the same way as five-axis transformations.

Reference:

Function Manual, Special Functions; Multi-Axis Transformations (F2)

Syntax

TRAORI (<n>)

TRAORI (<n>, <X>, <Y>, <Z>, <A>,)

TRAFOOF

Meaning

TRAORI:	Activates the first specified orientation transformation	
TRAORI (<n>):	Activates the orientation transformation specified by n	
<n>:	Number of the transformation	
	Value:	1 or 2
	Example: TRAORI(1) activates orientation transformation 1	
<X>, <Y>, <Z>:	Component of orientation vector to which tool points	
<A>, :	Programmable offset for the rotary axes	
TRAFOOF:	Deactivate transformation	

Tool orientation

Depending on the orientation direction selected for the tool, the active working plane (G17, G18, G19) must be set in the NC program in such a way that tool length offset works in the direction of tool orientation.

Note

When the transformation is enabled, the positional data (X, Y, Z) always relates to the tip of the tool. Changing the positions of the rotary axes involved in the transformation causes compensating motion of the remaining machine axes - which means that the position of the tool tip remains unchanged.

Orientation transformation always points from the tool tip to the tool adapter.

Offset for orientation axes

When orientation transformation is activated an additional offset can be programmed directly for the orientation axes.

7.2 Three, four and five axis transformation (TRAORI)

Parameters can be omitted if the correct sequence is used in programming.

Example:

TRAORI (, , , A,B) ; If only a single offset is to be entered

As an alternative to direct programming, the additional offset for orientation axes can also be transferred automatically from the zero offset currently active. Transfer is configured in the machine data.

Examples

TRAORI (1,0,0,1)	; The basic orientation of the tool is in the Z direction
TRAORI (1,0,1,0)	; The basic orientation of the tool is in the Z direction
TRAORI (1,0,1,1)	; The basic orientation of the tool is in the Y/Z direction (corresponds to the position -45°)

7.2.3 Variants of orientation programming and initial setting (ORIRESET)

Orientation programming of tool orientation with TRAORI

In conjunction with a programmable TRAORI orientation transformation, in addition to the linear axes X, Y, Z, the rotary axis identifiers A., B..., C... can also be used to program axis positions or virtual axes with angles or vector components. Various types of interpolation are possible for orientation and machine axes. Regardless of which PO[angle] orientation polynomials and PO[axis] axis polynomials are currently active, a number of different types of polynomial can be programmed. These include G1, G2, G3, CIP or POLY.

Changes in tool orientation can even be programmed using orientation vectors in some cases. In such cases, the ultimate orientation of each block can be set either by means of direct programming of the vector or by programming the rotary axis positions.

Variants of orientation programming for three- to five-axis transformation

The following versions of orientation programming are mutually exclusive.

A, B, C	Direct entry of rotary axis positions.
A2, B2, C2	Angle programming of virtual axes via Euler angles or RPY angles
A3, B3, C3	Vector component designation
LEAD, TILT	Specification of lead and tilt angles with reference to path and surface
A4, B4, C4 A5, B5, C5	Surface normal vectors at the start of the block and at the end of the block
A6, B6, C6 A7, B7, C7	Interpolation of the orientation vector on a taper surface transformation.
A8, B8, C8	Redirection of the tool, direction and path length of the retraction movement

Approach initial setting of the tool orientation (ORIRESET)

Through `ORIRESET (. . .)`, the orientation axes of the relevant machine kinematics are traversed linearly and synchronously from their current positions to the programmed initial state positions. If a basic position is not programmed for an axis, the position from the associated machine data `$MC_TRAFO5_ROT_AX_OFFSET_1/2` is used.

Active frames of rotary axes are ignored.

Examples of machine kinematics CA (channel axis names C, A)

Commands	Description
<code>ORIRESET(90, 45)</code>	Axis C: 90° Axis A: 45°
<code>ORIRESET(, 30)</code>	Axis C: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[0]</code> Axis A: 30°
<code>ORIRESET()</code>	Axis C: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[0]</code> Axis A: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[1]</code>

Examples of machine kinematics CAC (channel axis names C, A, B)

Commands	Description
<code>ORIRESET(90, 45, 90)</code>	Axis C: 90° Axis A: 45° Axis B: 90°
<code>ORIRESET()</code>	Axis C: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[0]</code> Axis A: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[1]</code> Axis B: <code>\$MC_TRAFO5_ROT_AX_OFFSET_1/2[2]</code>

Note

Travel to the initial state of the tool orientation with `ORIRESET . . .)` may only take place with active orientation transformation `TRAORI . . .)`.

Programming LEAD, TILT and THETA rotations

Lead angle LEAD and tilt angle TILT.

In respect of three- to five-axis transformation, tool orientation rotations are programmed with the LEAD and TILT angles.

Angle of rotation THETA

For a transformation **with third rotary axis**, the rotation of the tool about itself can be programmed with the THETA rotary angle both for orientation with vector components as well as for programming the angles LEAD, TILT.

7.2.4 Programming the tool orientation (A..., B..., C..., LEAD, TILT)

The following options are available when programming tool orientation:

1. Direct programming the motion of rotary axes. The change of orientation always occurs in the basic or machine coordinate system. The orientation axes are traversed as synchronized axes.
2. Programming in Euler or RPY angles in accordance with angle definition using A2, B2, C2
3. Programming the direction vector using A3, B3, C3 The direction vector points from the tool tip toward the tool adapter.
4. Programming the surface normal vector at the start of the block with A4, B4, C4 and at the end of the block with A5, B5, C5 (face milling).
5. Programming using lead angle LEAD and tilt angle TILT
6. Programming the rotary axis of taper as normalized vector using A6, B6, C6 or of intermediate orientation on the peripheral surface of a taper using A7, B7, C7, see "Orientation programming along the peripheral surface of a taper (ORIPLANE, ORICONxx)".
7. Programming the reorientation, direction and path length of tool during retraction movement using A8, B8, C8, see "Smoothing the orientation characteristic (ORIPATHS A8=, B8=, C8=)"

Note

In all cases, orientation programming is only permissible if an orientation transformation is active.

Advantage: These programs can be transferred to any machine kinematics.

Definition of tool orientation via G command

Note

Machine manufacturer

Machine data can be used to switch between Euler or RPY angles. If the machine data is set accordingly, changeovers are possible both depending on the active G command of group 50 and irrespective of this. The following setting options can be selected:

1. If both machine data for defining the orientation axes and defining the orientation angle are set to zero via G command:
The angles programmed using A2, B2, C2 are **dependent on machine data**. The angle definition of orientation programming is either interpreted as Euler or RPY angles.
2. If the machine data for defining the orientation axes is set to one via G command, the changeover is **dependent** on the active G command of group 50:
The angles programmed using A2, B2, C2 are interpreted in accordance with the active G commands ORIEULER, ORIRPY, ORIVIRT1, ORIVIRT2, ORIAXPOS and ORIPY2. The values programmed with the orientation axes are also interpreted as orientation angles in accordance with the active G command of group 50.
3. If the machine data for defining the orientation angle is set to one via G command and the machine data for defining the orientation axes is set to zero via G command, the changeover is **not dependent** on the active G command of group 50:
The angles programmed using A2, B2, C2 are interpreted in accordance with one of the active G commands ORIEULER, ORIRPY, ORIVIRT1, ORIVIRT2, ORIAXPOS and ORIPY2. The values programmed with the orientation axes are always interpreted as round axis positions irrespective of the active G command of group 50.

Meaning

G1:	Linear interpolation
X, Y, Z:	Linear axis positions
A, B, C:	Rotary axis positions
A2=, B2=, C2=:	Angle programming (Euler or RPY angle)
A3=, B3=, C3=:	Directional vectors in the X, Y and Z coordinates of the WCS.
A4=, B4=, C4=:	Surface normal vectors at the start of the block in the X, Y and Z coordinates of the WCS.
A5=, B5=, C5=:	Surface normal vectors at the end of the block in the X, Y and Z coordinates of the WCS.
LEAD= :	Leading angle ¹⁾
TILT= :	Tilt angle ¹⁾
1) The interpretation of the angle indications depend on the setting in MD21094 \$MC_ORIPATH_MODE	

Further information

5-axis programs are usually generated by CAD/CAM systems and not entered at the control. So the following explanations are directed mainly at programmers of postprocessors.

The following commands are available for orientation programming:

Command	Meaning
ORIEULER:	Euler angle with rotation sequence ZX'Z"
ORIRPY:	RPY angle with rotation sequence XY'Z"
ORIRPY2:	RPY angle with rotation sequence ZY'X"
ORIVIRT1:	Virtual orientation axes with freely definable rotation sequence via: MD21120 \$MC_ORIAX_TURN_TAB_1
ORIVIRT2:	Virtual orientation axes with freely definable rotation sequence via: MD21130 \$MC_ORIAX_TURN_TAB_2
ORIAPOS:	Virtual orientation axes with rotary axis positions

Note

The machine manufacturer can use machine data to define various variants. Please refer to the machine manufacturer's instructions.

Programming in Euler angles ORIEULER, rotation sequence Z X' Z"

The values programmed during ORIEULER orientation programming with A2, B2, C2 are interpreted as Euler angles (in degrees).

7.2 Three, four and five axis transformation (TRAORI)

The new orientation vector results from the following three rotations of the original orientation vector

1. with the rotary axis **A2** about the coordinate axis **Z**
2. with the rotary axis **B2** about the new coordinate axis **X'**
3. with the rotary axis **C2** about the coordinate axis **Z''**

In this case the value of **C2** (rotation around the new **Z** axis) is meaningless and does not have to be programmed.

Programming in RPY angles **ORIRPY**, rotation sequence **X Y' Z''**

The values programmed during **ORIEULER** orientation programming with **A2**, **B2**, **C2** are interpreted as RPY angles (in degrees) with the rotation sequence **X Y' Z''**.

Note

In contrast to programming with **ORIEULER**, with **ORIRPY** all three values here have an effect on the orientation vector.

The new orientation vector results from the following three rotations of the original orientation vector

1. with the rotary axis **A2** about the coordinate axis **X**
2. with the rotary axis **B2** about the new coordinate axis **Y'**
3. with the rotary axis **C2** about the coordinate axis **Z''**

Programming the directional vector

The components of the direction vector are programmed with **A3**, **B3**, **C3**. The vector points towards the tool adapter; the length of the vector is of no significance.

Vector components that have not been programmed are set equal to zero.

X, Y, Z Coordinate axes of the WCS

A3, B3, C3 Components of the directional vector

O Orientation vector

Figure 7-1 Programming the directional vector

Programming the tool orientation with LEAD and TILT

The resultant tool orientation is determined from:

- Path tangent
- Surface normal vector
At the start of the block A4, B4, C4 and at the end of the block A5, B5, C5
- Lead angle LEAD
Angle in the plane defined by the path tangent and surface normal vector
- Tilt angle TILT at end of block
Angle in the plane, perpendicular to the path tangent relative to the surface normal vector

- T Path tangent
- S Perpendicular to path tangent
- N Surface normal
- B Path
- TCP Tool Center Point
- O Orientation vector

Figure 7-2 Programming of LEAD TILT

Note

Behavior at inside corners with 3D tool offset

If the block is shortened at an inside corner, the programmed tool orientation is still taken over at the end of the block.

7.2.5 Face milling (A4, B4, C4, A5, B5, C5)

Face milling is used to machine curved surfaces of any kind.

For this type of 3D milling, you will require the line-by-line description of the 3D paths on the workpiece surface.

The tool shape and dimensions are taken into account in the calculations, which are normally performed in CAM. The fully calculated NC blocks are then read into the control via postprocessors.

Programming the path curvature

Surface description

The path curvature is described by surface normal vectors with the following components:

A4, B4, C4 Start vector at block start

A5, B5, C5 End vector at block end

If a block only contains the start vector, the surface normal vector will remain constant throughout the block. If a block only contains the end vector, interpolation will run from the end value of the previous block via large-circle interpolation to the programmed end value.

If the start and end vectors are programmed, interpolation runs between the two directions, also via large-circle interpolation. This allows continuously smooth paths to be created.

Regardless of the active G17 to G19 level, in the initial setting, surface normal vectors point in the Z direction.

The length of a vector is meaningless.

Vector components that have not been programmed are set to zero.

7.2 Three, four and five axis transformation (TRAORI)

When ORIWKS is active (see "Reference of the orientation axes (ORIWKS, ORIMKS): (Page 338)"), the surface normal vectors refer to the active frame and are also rotated with frame rotation.

Machine manufacturer

The surface normal vector must be perpendicular to the path tangent, within a limit value set via machine data, otherwise an alarm will be output.

7.2.6

Reference of the orientation axes (ORIWKS, ORIMKS):

For orientation programming in the workpiece coordinate system using

- Euler or RPY angle or
- Orientation vector

the course of the rotary motion can be set using ORIMKS/ORIWKS.

Note

Machine manufacturer

The type of interpolation for the orientation is specified with machine data:

MD21104 \$MC_ORI_IPO_WITH_G_CODE

= FALSE: The reference is provided by the G commands ORIWKS und ORIMKS.

= TRUE: The reference are the G commands of the 51th group (ORIAxes, ORIVect, ORIPlane, ...)

Syntax

ORIMKS=...

ORIWKS=...

Meaning

ORIMKS:	Rotation in the machine coordinate system
ORIWKS:	Rotation in the workpiece coordinate system

Note

ORIWKS is the basic setting. In the case of a 5-axis program, if it is not immediately obvious on which machine it is to run, ORIWKS must always be selected. Which movements the machine actually executes depend on the machine kinematics.

ORIMKS can be used to program actual machine movements (to avoid collisions with devices or similar, for example).

Further information

With **ORIMKS**, the movement executed by the tool **depends** on the machine kinematics. In the case of a change in orientation of a tool tip at a fixed point in space, linear interpolation takes place between the rotary axis positions.

With **ORIWKS**, the movement executed by the tool **does not depend** on the machine kinematics. With an orientation change with a fixed tool tip, the tool moves in the plane set up by the start and end vectors.

Singular positions

Note

ORIWKS

Orientation movements in the singular setting area of the 5-axis machine require vast movements of the machine axes. (For example, with a rotary swivel head with C as the rotary axis and A as the swivel axis, all positions with $A = 0$ are singular.)

Machine manufacturer

To avoid overloading the machine axes, the velocity control vastly reduces the tool path velocity near the singular positions.

With machine data

```
$MC_TRAFO5_NON_POLE_LIMIT
```

```
$MC_TRAFO5_POLE_LIMIT
```

the transformation can be parameterized in such a way that orientation movements close to the pole are put through the pole and rapid machining is possible.

Singular positions are handled only with the MD `$MC_TRAFO5_POLE_LIMIT`.

"Singular Points and How to Deal with Them" section.

7.2.7 Programming orientation axes (ORIAXES, ORIVECT, ORIEULER, ORIRPY, ORIRPY2, ORIVIRT1, ORIVIRT2)

The "Orientation axes" function describes the orientation of the tool in space and is achieved by programming the offset for the rotary axes. An additional, third degree of freedom can be achieved by also rotating the tool about itself. In this case, the tool is oriented in space via a third rotary axis for which 6-axis transformation is required. The rotation of the tool about itself is defined using the THETA angle of rotation in accordance with the type of interpolation of the rotation vectors (see "Rotations of the tool orientation (ORIROTA, ORIROTR, ORIROTT, ORIROTC, THETA) (Page 350)").

Axis identifiers A2, B2 and C2 are used to program the orientation axes.

Syntax

```

N... ORIAXES/ORIVECT                ; Linear or large-circle interpolation
N... G1 X Y Z A B C

N... ORIPLANE                        ; Orientation interpolation of the plane

N... ORIEULER/ORIRPY/ORIRPY2        : Orientation angle Euler/RPY angle
N... G1 X Y Z A2= B2= C2=           ; Angle programming of virtual axes

N... ORIVIRT1/ORIVIRT2              ; Virtual orientation axes def. 1/2
N... G1 X Y Z A3= B3= C3=           ; Direction vector programming

```

Note

Other rotary axis offsets of the orientation axes can be programmed for orientation changes along the peripheral surface of a taper in space, see "Orientation programming along the peripheral surface of a taper (ORIPLANE, ORICONCW, ORICONCCW, ORICONTO, ORICONIO) (Page 342)".

Meaning

ORIAXES:	Linear interpolation of machine or orientation axes
ORIVECT:	Large-circle interpolation (identical to ORIPLANE)
ORIMKS: ORIWKS:	Rotation in the machine coordinate system Rotation in the workpiece coordinate system For a description, see "Reference of the orientation axes (ORIWKS, ORIMKS): (Page 338)".
A= B= C=:	Programming the machine axis position

7.2 Three, four and five axis transformation (TRAORI)

ORIEULER:	Orientation programming via Euler angle
ORIRPY:	Orientation programming via RPY angle The rotation sequence is XYZ and: <ul style="list-style-type: none"> • A2 is the angle of rotation around X • B2 is the angle of rotation around Y • C2 is the angle of rotation around Z
ORIRPY2:	Orientation programming via RPY angle The rotation sequence is ZYX and: <ul style="list-style-type: none"> • A2 is the angle of rotation around Z • B2 is the angle of rotation around Y • C2 is the angle of rotation around X
A2= B2= C2=:	Angle programming of virtual axes
ORIVIRT1/ORIVIRT2:	Orientation programming using virtual orientation axes Definition 1: Definition according to MD21120 \$MC_ORIAX_TURN_TAB_1 Definition 2: Definition according to MD21130 \$MC_ORIAX_TURN_TAB_2
A3= B3= C3=:	Direction vector programming of direction axis

Further information**Machine manufacturer**

MD21102 \$MC_ORI_DEF_WITH_G_CODE specifies how the programmed angles A2, B2, C2 are defined:

The definition is according to MD21100 \$MC_ORIENTATION_IS_EULER (standard) or the definition is according to G group 50 (ORIEULER, ORIRPY, ORIVIRT1, ORIVIRT2).

MD21104 \$MC_ORI_IPO_WITH_G_CODE defines which interpolation mode type is active: ORIWKS/ORIMKS or ORIAXES/ORIVECT.

JOG mode

Interpolation for orientation angles in this mode of operation is always linear. During continuous and incremental traversal via the traversing keys, only one orientation axis can be traversed. Orientation axes can be traversed simultaneously using the handwheels.

When orientation axes are traversed manually, the channel-specific feedrate override switch or the rapid traverse override switch in rapid traverse override is applied.

A separate velocity setting is possible with the following machine data:

MD21160 \$MC_JOG_VELO_RAPID_GEO

MD21165 \$MC_JOG_VELO_GEO

MD21150 \$MC_JOG_VELO_RAPID_ORI

MD21155 \$MC_JOG_VELO_ORI

Note

SINUMERIK 840D sl with "handling transformation package"

Using the "Cartesian manual traverse" function, the translation of geometry axes in JOG mode can be set separately from one another in the reference systems MCS, WCS and TCS.

Function Manual Extended Functions; Kinematic Transformation (M1)

7.2.8

Orientation programming along the peripheral surface of a taper (ORIPLANE, ORICONCW, ORICONCCW, ORICONTO, ORICONIO)

With extended orientation it is possible to execute a change in orientation along the peripheral surface of a taper in space. The orientation vector is interpolated on the peripheral surface of a taper using the ORICONxx modal command. The end orientation can be programmed with ORIPLANE for interpolation on a plane. The start orientation is usually defined by the previous blocks.

Programming

The end orientation is either defined by specifying the angle programming in the Euler or RPY angle using A2, B2, C2 or by programming the rotary axis positions using A, B, C. Further programming details are needed for orientation axes along the peripheral surface of a taper:

- Rotary axis of taper as a vector with A6, B6, C6
- Opening angle PSI with identifier NUT
- Intermediate orientation outside of the taper with A7, B7, C7

Note

Programming direction vector A6, B6, C6 for the rotary axis of the taper

The programming of an end orientation is not absolutely necessary. If no end orientation is specified, a full outside taper with 360 degrees is interpolated.

Programming the opening angle of the taper with NUT=angle

An end orientation must be specified.

A complete outside taper with 360 degrees cannot be interpolated in this way.

Programming the intermediate orientation A7, B7, C7 on the outside of the taper

An end orientation must be specified. The change in orientation and the direction of rotation is defined uniquely by the three vectors Start orientation, End orientation and Intermediate orientation. All three vectors must be different. If the programmed intermediate orientation is parallel to the start or end orientation, a linear large-circle interpolation of the orientation is executed in the plane that is defined by the start and end vector.

Extended orientation interpolation on the peripheral surface of a taper

```

N... A6= B6= C6= A3= B3= C3=
or
N... ORICONTO
N... G1 X Y Z A6= B6= C6=
or
N... ORICONIO
N... G1 X Y Z A7= B7= C7=
N... PO[PHI]=(a2, a3, a4, a5)
N... PO[PSI]=(b2, b3, b4, b5)
```

Interpolation on the outside of a taper with direction vector in the clockwise/counter-clockwise direction of the taper and end orientation or tangential transition and specification of end orientation or specification of end orientation and intermediate orientation on the outside of the taper with polynomials for angle of rotation and polynomials for opening angle

Parameters

ORIPLANE:	Interpolation in the plane (large-circle interpolation)
ORICONCW:	Interpolation on the peripheral surface of a taper in the clockwise direction
ORICONCCW:	Interpolation on the peripheral surface of a taper in the counter-clockwise direction

7.2 Three, four and five axis transformation (TRAORI)

ORICONTO:	Interpolation on the peripheral surface of a taper with tangential transition
A6= B6= C6=:	Programming of a rotary axis of the taper (normalized vector)
NUT=angle:	Opening angle of taper in degrees
NUT=+179:	Traverse angle less than or equal to 180 degrees
NUT=-181:	Traverse angle greater than or equal to 180 degrees
ORICONIO:	Interpolation on the peripheral surface of a taper
A7= B7= C7=:	Intermediate orientation (programming as normalized vector)
PHI:	Angle of rotation of the orientation about the direction axis of the taper
PSI:	Opening angle of the taper
Possible polynomials PO[PHI]=(a2, a3, a4, a5) PO[PSI]=(b2, b3, b4, b5)	Apart from the different angles, polynomials can also be programmed up to the 5th degree

Example: Different changes to orientation

Program code	Comment
...	
N10 G1 X0 Y0 F5000	
N20 TRAORI(1)	; Orientation transformation ON
N30 ORIVECT	; Interpolate tool orientation as a vector.
...	; Tool orientation in the plane.
N40 ORIPLANE	; Select large-circle interpolation.
N50 A3=0 B3=0 C3=1	
N60 A3=0 B3=1 C3=1	; Orientation in the Y/Z plane is rotated through 45 degrees, orientation (0,1/√2,1/√2) is reached at the end of the block.
...	
N70 ORICONCW	; Orientation programming on the outside of the taper:
N80 A6=0 B6=0 C6=1 A3=0 B3=0 C3=1	The orientation vector is interpolated on the outside of a taper with the direction (0,0,1) up to the orientation (1/√2,0,1/√2) in the clockwise sense, the angle of rotation is 270 degrees.
N90 A6=0 B6=0 C6=1	; The tool orientation goes through a full revolution on the outside of the same taper.

Further information

If changes of orientation along the peripheral surface of a taper anywhere in space are to be described, the vector about which the tool orientation is to be rotated must be known. The start and end orientation must also be specified. The start orientation results from the previous block and the end orientation has to be programmed or defined via other conditions.

Programming in the ORIPLANE plane corresponds to ORIVECT

The programming of large-radius circular interpolation together with angle polynomials corresponds to the linear and polynomial interpolation of contours. The tool orientation is interpolated in a plane that is defined by the start and end orientation. If additional polynomials are programmed, the orientation vector can also be tilted out of the plane.

Programming of circles in a plane G2/G3, CIP and CT

The extended orientation corresponds to the interpolation of circles in a plane. For the corresponding programming options for circles with centers or radii such as G2/G3, circle via intermediate point CIP and tangential circles CT, see

References: Programming Manual Fundamentals, "Programming motion commands".

Orientation programming**Interpolation of the orientation vector on the peripheral surface of a taper ORICONxx**

Four different types of interpolation from G group 51 can be selected for interpolating orientations on the peripheral surface of a taper:

1. Interpolation on the outside of a taper in the clockwise direction **ORICONCW** with specification of end orientation and taper direction, or opening angle. The direction vector is programmed with identifiers **A6**, **B6**, **C6** and the opening angle of the taper with identifier **NUT=** value range in interval 0 degrees to 180 degrees.
2. Interpolation on the outside of a taper in the counterclockwise direction **ORICONCCW** with specification of end orientation and taper direction, or opening angle. The direction vector is programmed with identifiers **A6**, **B6**, **C6** and the opening angle of the taper with identifier **NUT=** value range in interval 0 degrees to 180 degrees.
3. Interpolation on the outside of a taper **ORICONIO** with specification of end orientation and an intermediate orientation, which is programmed with identifiers **A7**, **B7**, **C7**.
4. Interpolation on the outside of a taper **ORICONTO** with tangential transition and specification of end orientation. The direction vector is programmed with identifiers **A6**, **B6**, **C6**.

7.2.9 Specification of orientation for two contact points (ORICURVE, PO[XH]=, PO[YH]=, PO[ZH]=)

Programming the change in orientation using the second curve in space ORICURVE

Another way to program changes in orientation, besides using the tool tip along a curve in space, is to program the motion of a second contact point of the tool using **ORICURVE**. In this way, changes in tool orientation can be defined uniquely, as when programming the tool vector itself.

Machine manufacturer

Please refer to the machine manufacturer's notes on axis identifiers that can be set via machine data for programming the 2nd orientation path of the tool.

Programming

This type of interpolation can be used to program points (using G1) or polynomials (using POLY) for the two curves in space. Circles and involutes are not permitted. A BSPLINE spline interpolation and the "Combine short spline blocks" function can also be activated.

References:

Function Manual, Basic Functions; Continuous-Path Mode, Exact Stop, Look Ahead (B1), Section: Combine short spline blocks

The other spline types, ASPLINE and CSPLINE, and compressor activation using COMPON, COMPCURV or COMPCAD are not permitted.

The motion of the two contact points of the tool can be predefined up to the 5th degree when programming the orientation polynomials for coordinates.

Extended orientation interpolation with additional curve in space and polynomials for coordinates

N... ORICURVE	Specification of the motion of the second contact point of the tool and additional polynomials of the coordinates in question
N... PO[XH]=(xe, x2, x3, x4, x5)	
N... PO[YH]=(ye, y2, y3, y4, y5)	
N... PO[ZH]=(ze, z2, z3, z4, z5)	

Parameters

ORICURVE	Interpolation of the orientation specifying a movement between two contact points of the tool.
XH YH ZH	Identifiers of the coordinates of the second contact point of the tool of the additional contour as a curve in space
Possible polynomials PO[XH]=(xe, x2, x3, x4, x5) PO[YH]=(ye, y2, y3, y4, y5) PO[ZH]=(ze, z2, z3, z4, z5)	Apart from using the appropriate end points, the curves in space can also be programmed using polynomials.
xe, ye, ze	End points of the curve in space
xi, yi, zi	Coefficients of the polynomials up to the 5th degree

Note**Identifiers XH YH ZH for programming a 2nd orientation path**

The identifiers must be selected such that no conflict arises with the other identifiers or linear axes

X Y Z axes

and rotary axes such as

A2 B2 C2 Euler angle or RPY angle

A3 B3 C3 direction vectors

A4 B4 C4 or A5 B5 C5 surface normal vectors

A6 B6 C6 rotation vectors or A7 B7 C7 intermediate point coordinates
or other interpolation parameters.

7.3 Orientation polynomials (PO[angle], PO[coordinate])

Irrespective of the polynomial interpolation from G group 1 that is currently active, two different types of orientation polynomial can be programmed up to the 5th degree for a three-axis to five-axis transformation.

1. Polynomials for **angles**: lead angle LEAD, tilt angle TILT in relation to the plane that is defined by the start and end orientation.
2. Polynomials for **coordinates**: XH, YH, ZH of the second curve in space for the tool orientation of a reference point on the tool.

With a 6-axis transformation, the rotation of rotation vector THT can be programmed with polynomials up to the 5th degree for rotations of the tool itself, in addition to the tool orientation.

Syntax

Type 1 orientation polynomials for **angles**

N... PO[PHI]=(a2, a3, a4, a5) 3-axis to 5-axis transformation
N... PO[PSI]=(b2, b3, b4, b5)

Type 2 orientation polynomials for **coordinates**

N... PO[XH]=(xe, x2, x3, x4, x5) Identifiers for the coordinates of the second
N... PO[YH]=(ye, y2, y3, y4, y5) orientation path for tool orientation
N... PO[ZH]=(ze, z2, z3, z4, z5)

In both cases, with 6-axis transformations, a polynomial can also be programmed for the **rotation** using

N... PO[THT]=(c2, c3, c4, c5) Interpolation of the rotation relative to the path
or
N... PO[THT]=(d2, d3, d4, d5) Interpolation absolute, relative and tangential
to the change of orientation

of the orientation vector. This is possible if the transformation supports a rotation vector with an offset that can be programmed and interpolated using the THETA angle of rotation.

Meaning

PO[PHI]	Angle in the plane between start and end orientation
PO[PSI]	Angle describing the tilt of the orientation from the plane between start and end orientation
PO[THT]	Angle of rotation created by rotating the rotation vector of one of the G commands of group 54 that is programmed using THETA
PHI	Lead angle LEAD
PSI	Tilt angle TILT
THETA	Rotation about the tool direction in Z

7.3 Orientation polynomials (*PO[angle]*, *PO[coordinate]*)

PO [XH]	X coordinate of the reference point on the tool
PO [YH]	Y coordinate of the reference point on the tool
PO [ZH]	Z coordinate of the reference point on the tool

Further information

Orientation polynomials cannot be programmed:

- If ASPLINE, BSPLINE, CSPLINE spline interpolations are active.
Type 1 polynomials for orientation angles are possible for every type of interpolation except spline interpolation, that is, linear interpolation with rapid traverse G00 or with feedrate G01 with polynomial interpolation using POLY and circular/involute interpolation G02, G03, CIP, CT, INVCW and INCCW.
However, type 2 polynomials for orientation coordinates are only possible if linear interpolation with rapid traverse G00 or with feedrate G01 or polynomial interpolation with POLY is active.
- If the orientation is interpolated using ORIAXES axis interpolation. In this case, polynomials can be programmed directly with PO[A] and PO[B] for orientation axes A and B.

Type 1 orientation polynomials with ORIVECT, ORIPLANE and ORICONxx

Only type 1 orientation polynomials are possible for large-radius circular interpolation and interpolation outside of the taper with ORIVECT, ORIPLANE and ORICONxx.

Type 2 orientation polynomials with ORICURVE

If interpolation with the additional curve in space ORICURVE is active, the Cartesian components of the orientation vector are interpolated and only type 2 orientation polynomials are possible.

7.4 Rotations of the tool orientation (ORIOTA, ORIOTR, ORIOTT, ORIOTC, THETA)

If you also want to be able to change the orientation of the tools on machine types with movable tools, program each block with end orientation. Depending on the machine kinematics you can either program the orientation direction of the orientation axes or the direction of rotation of orientation vector THETA. Different interpolation types can be programmed for these rotation vectors:

- ORIOTA: Angle of rotation to an absolute direction of rotation.
- ORIOTR: Angle of rotation relative to the plane between the start and end orientation.
- ORIOTT: Angle of rotation relative to the change in the orientation vector.
- ORIOTC: Tangential angle of rotation to the path tangent.

Syntax

Only if interpolation type ORIOTA is active can the angle of rotation or rotation vector be programmed in all four modes as follows:

1. Directly as rotary axis positions A, B, C
2. Euler angles (in degrees) with A2, B2, C2
3. RPY angles (in degrees) with A2, B2, C2
4. Direction vector via A3, B3, C3 (angle of rotation using THETA=<value>)

If ORIOTR or ORIOTT is active, the angle of rotation can only be programmed directly with THETA.

A rotation can also be programmed in a separate block without an orientation change taking place. In this case, ORIOTR and ORIOTT are irrelevant. In this case, the angle of rotation is always interpreted with reference to the absolute direction (ORIOTA).

```

N... ORIOTA           Define the interpolation of the rotation vector
N... ORIOTR
N... ORIOTT
N... ORIOTC
N... A3= B3= C3= THETA=<value> Define the rotation of the orientation vector
N... PO[THT]=(d2, d3, d4, d5)  Interpolate angle of rotation with a 5th order polynomial
  
```

Meaning

ORIOTA:	Angle of rotation to an absolute direction of rotation
ORIOTR:	Angle of rotation relative to the plane between the start and end orientation
ORIOTT:	Angle of rotation as a tangential rotation vector to the change of orientation
ORIOTC:	Angle of rotation as a tangential rotation vector to the path tangent
THETA:	Rotation of the orientation vector

7.4 Rotations of the tool orientation (ORIROTA, ORIROTR, ORIROTT, ORIROT, THETA)

THETA=<value>:	Angle of rotation in degrees reached by the end of the block
THETA=Θ _e :	Angle of rotation with end angle Θ _e of rotation vector
THETA=AC (...):	Non-modal switchover to absolute dimensions
THETA=AC (...):	Non-modal switchover to incremental dimensions
Θ _e :	End angle of rotational vector both absolute with G90 and relative with G91 (incremental dimensioning) is active
PO[THT]=(...):	Polynomial for angle of rotation

Example: Rotations of the orientations

Program code	Comment
N10 TRAORI	; Activate orientation transformation
N20 G1 X0 Y0 Z0 F5000	; Tool orientation
N30 A3=0 B3=0 C3=1 THETA=0	; In Z direction with angle of rotation 0
N40 A3=1 B3=0 C3=0 THETA=90	; In X direction and rotation about 90 degrees
N50 A3=0 B3=1 C3=0 PO[THT]=(180,90)	; Orientation
N60 A3=0 B3=1 C3=0 THETA=IC(-90)	; In Y direction and rotation about 180 degrees
N70 ORIROTT	; Remains constant and rotation to 90 degrees
N80 A3=1 B3=0 C3=0 THETA=30	; Angle of rotation relative to change of orientation ; Rotation vector in angle 30 degrees to X/Y plane

When interpolating block N40, the angle of rotation from initial value of 0 degrees to final value of 90 degrees is interpolated linearly. In block N50, the angle of rotation changes from 90 degrees to 180 degrees, according to parabola $\theta(u) = +90u^2$. In N60, a rotation can also be executed without a change in orientation taking place.

With N80, the tool orientation is rotated from the Y direction toward the X direction. The change in orientation takes place in the X/Y plane and the rotation vector describes an angle of 30 degrees to this plane.

Further information

ORIROTA

The angle of rotation **THETA** is interpolated with reference to an absolute direction in space. The basic direction of rotation is defined in the machine data.

ORIROTR

The angle of rotation **THETA** is interpreted relative to the plane defined by the start and end orientation.

ORIROTT

The angle of rotation **THETA** is interpreted relative to the change in orientation. For **THETA=0** the rotation vector is interpolated tangentially to the change in orientation and only differs from **ORIROTR** if at least one polynomial has been programmed for "tilt angle PSI" for the orientation. The result is a change in orientation that is not executed in the plane. An additional angle of

7.4 Rotations of the tool orientation (*ORIROTA, ORIROTR, ORIROTT, ORIOTC, THETA*)

rotation *THETA* can then be used to interpolate the rotation vector such that it always produces a specific value referred to the change in orientation.

ORIOTC

The rotation vector is interpolated relative to the path tangent with an offset that can be programmed using the *THETA* angle. A polynomial $PO[THT] = (c2, c3, c4, c5)$ up to the 5th degree can also be programmed for the offset angle.

7.5 Orientations relative to the path

7.5.1 Orientation types relative to the path

By using this expanded function, relative orientation is not only achieved at the end of the block, but across the entire trajectory. The orientation achieved in the previous block is transferred to the programmed end orientation using large-circle interpolation. There are basically two ways of programming the desired orientation relative to the path:

1. Like the tool rotation, the tool orientation is interpolated relative to the path using ORIPATH, ORPATHTS.
2. The orientation vector is programmed and interpolated in the usual manner. The rotation of the orientation vector is initiated relative to the path tangent using ORIOTC.

Syntax

The type of interpolation of the orientation and the rotation of the tool is programmed using:

N... ORIPATH	Orientation relative to the path
N... ORIPATHS	Orientation relative to the path with smoothing of orientation characteristic
N... ORIOTC	Interpolation of the rotation vector relative to the path

An orientation blip caused by a corner on the trajectory can be smoothed using ORIPATHS. The direction and path length of the retracting movement is programmed via the vector using the components A8=X, B8=Y C8=Z.

ORIPATH/ORIPATHS can be used to program various references to the path tangent via the three angles

- LEAD= Specification of lead angle relative to the path and surface
- TILT= Specification of tilt angle relative to the path and surface
- THETA= Angle of rotation

for the entire trajectory. Polynomials up to the 5th degree can be programmed in addition to the THETA angle of rotation using PO[THT]=(...).

Note

Machine manufacturer

Please refer to the machine manufacturer's instructions. Other settings can be made for orientations relative to the path via configurable machine and setting data. For more detailed information, please refer to

References:

/FB3/ Function Manual, Special Functions; 3 to 5-Axis Transformation (F2), Section "Orientation"

Meaning

Various settings can be made for the interpolation of angles `LEAD` and `TILT` via machine data:

- The tool-orientation reference programmed using `LEAD` and `TILT` is retained for the entire block.
- Lead angle `LEAD`: rotation about the direction vertical to the tangent and normal vector
`TILT`: rotation of the orientation about the normal vector.
- Lead angle `LEAD`: rotation about the direction vertical to the tangent and normal vector
Tilt angle `TILT`: rotation of the orientation in the direction of the path tangent.
- Angle of rotation `THETA`: rotation of the tool about itself with an additional third rotary axis acting as an orientation axis in 6-axis transformation.

Note

Orientation relative to the path not permitted in conjunction with `OSC`, `OSS`, `OSSE`, `OSD` and `OST`

Orientation interpolation relative to the path, that is `ORIPATH` or `ORIPATHS` and `ORIOTC`, cannot be programmed in conjunction with orientation characteristic smoothing with a `G` command from group 34. `OSOF` has to be active for this.

7.5.2**Rotation of the tool orientation relative to the path (`ORIPATH`, `ORIPATHS`, angle of rotation)**

With a 6-axis transformation, the tool can be rotated about itself with a third rotary axis to orientate the tool as desired in space. With a rotation of the tool orientation relative to the path using `ORIPATH` or `ORIPATHS`, the additional rotation can be programmed via the `THETA` angle of rotation. Alternatively, the `LEAD` and `TILT` angles can be programmed using a vector, which is located in the plane vertical to the tool direction.

Machine manufacturer

Please refer to the machine manufacturer's instructions. The interpolation of the `LEAD` and `TILT` angles can be set differently using machine data.

Syntax**Rotation of tool orientation and tool**

The type of tool orientation relative to the path is activated using `ORIPATH` or `ORIPATHS`.

`N... ORIPATH`

Activate type of orientation relative to the path

`N... ORIPATHS`

Activate type of orientation relative to the path with smoothing of the orientation characteristic

Activating the three angles that can be rotated:

`N... LEAD=`

Angle for the programmed orientation relative to the surface normal vector

N... TILT=

Angle for the programmed orientation in the plane, vertical to the path tangent relative to the surface normal vector

N... THETA=

Angle of rotation relative to the change of orientation in the tool direction of the third rotary axis

The values of the angles at the end of block are programmed using LEAD=value, TILT=value or THETA=value. In addition to the constant angles, polynomials can be programmed for all three angles up to the 5th degree.

N... PO[PHI]=(a2, a3, a4, a5)

Polynomial for the leading angle LEAD

N... PO[PSI]=(b2, b3, b4, b5)

Polynomial for the tilt angle TILT

N... PO[THT]=(d2, d3, d4, d5)

Polynomial for the angle of rotation THETA

The higher polynomial coefficients, which are zero, can be omitted when programming. Example: PO[PHI]=a2 results in a parabola for the LEAD angle.

Meaning

Tool orientation relative to the path

ORIPATH:	Tool orientation in relation to path
ORIPATHS:	Tool orientation in relation to path, blips in the orientation characteristic are smoothed
LEAD:	Angle relative to the surface normal vector in the plane that is defined by the path tangent and the surface normal vector
TILT:	Rotation of orientation in the Z direction or rotation about the path tangent
THETA:	Rotation about the tool direction toward Z
PO[PHI]:	Orientation polynomial for the LEAD angle
PO[PSI]:	Orientation polynomial for the TILT angle
PO[THT]:	Orientation polynomial for the THETA angle of rotation

Note

Angle of rotation THETA

A 6-axis transformation is required to rotate a tool with a third rotary axis that acts as an orientation axis about itself.

7.5.3 Interpolation of the tool rotation relative to the path (ORIROTC, THETA)

Interpolation with rotation vectors

The rotation vector of the tool rotation, programmed with ORIROTC, relative to the path tangent can also be interpolated with an offset that can be programmed using the THETA angle of

rotation. A polynomial can, therefore, be programmed up to the 5th degree for the offset angle using PO[THT].

Syntax

N... ORIOTC	Initiate the rotation of the tool relative to the path tangent
N... A3= B3= C3= THETA=value	Define the rotation of the orientation vector
N... A3= B3= C3= PO[THT]=(c2, c3, c4, c5)	Interpolate offset angle with polynomial up to 5th degree

A rotation can also be programmed in a separate block without an orientation change taking place.

Meaning

Interpolation of the rotation of tool relative to the path in 6-axis transformation

ORIOTC:	Initiate tangential rotation vector relative to path tangent
THETA=value:	Angle of rotation in degrees reached by the end of the block
THETA=Θe:	Angle of rotation with end angle Θ _e of rotation vector
THETA=AC (...):	Non-modal switchover to absolute dimensions
THETA=IC (...):	Non-modal switchover to incremental dimensions
PO[THT]=(c2, c3, c4, c5):	Interpolate offset angle with polynomial of 5th degree

Note

Interpolation of the rotation vector ORIOTC

Initiating rotation of the tool relative to the path tangent in the opposite direction to the tool orientation, is only possible with a 6-axis transformation.

With active ORIOTC

Rotation vector ORIOTA cannot be programmed. If programming is undertaken, ALARM 14128 "Absolute programming of tool rotation with active ORIOTC" is output.

Orientation direction of the tool for 3-axis to 5-axis transformation

The orientation direction of the tool can be programmed via Euler angles, RPY angles or direction vectors as with 3-axis to 5-axis transformations. Orientation changes of the tool in space can also be achieved by programming the large-circle interpolation ORIVECT, linear interpolation of the orientation axes ORIAXES, all interpolations on the peripheral surface of a taper ORICONxx, and interpolation in addition to the curve in space with two contact points of the tool ORICURVE.

G....:	Details of the rotary axis motion
X, Y, Z:	Details of the linear axes

ORIXES:	Linear interpolation of machine or orientation axes
ORIVECT:	Large-circle interpolation (identical to ORIPLANE)
ORIMKS:	Rotation in the machine coordinate system
ORIWKS:	Rotation in the workpiece coordinate system
	Description, see the Rotations of the tool orientation section
A= B= C=:	Programming the machine axis position
ORIEULER:	Orientation programming via Euler angle
ORIRPY:	Orientation programming via RPY angle
A2= B2= C2=:	Angle programming of virtual axes
ORIVIRT1:	Orientation programming using virtual orientation axes
ORIVIRT2:	(definition 1), definition according to MD \$MC_ORIAX_TURN_TAB_1 (definition 2), definition according to MD \$MC_ORIAX_TURN_TAB_2
A3= B3= C3=:	Direction vector programming of direction axis
ORIPLANE:	Interpolation in the plane (large-circle interpolation)
ORICONCW:	Interpolation on the peripheral surface of a taper in the clockwise direction
ORICONCCW:	Interpolation on the peripheral surface of a taper in the counter-clockwise direction
ORICONTO:	Interpolation on the peripheral surface of a taper with tangential transition
A6= B6= C6=:	Programming of a rotary axis of the taper (normalized vector)
NUT=angle	Opening angle of taper in degrees
NUT=+179	Traverse angle less than or equal to 180 degrees
NUT=-181	Traverse angle greater than or equal to 180 degrees
ORICONIO:	Interpolation on the peripheral surface of a taper
A7= B7= C7=:	Intermediate orientation (programming as normalized vector)
ORICURVE XH YH ZH, e.g. with polynomials PO[XH]=(xe, x2, x3, x4, x5)	Interpolation of the orientation specifying a movement between two contact points of the tool. In addition to the end points, additional curve polynomials can also be programmed.

Note

If the tool orientation with active ORIXES is interpolated via the orientation axes, the angle of rotation is only initiated relative to the path at the end of block.

7.5.4 Smoothing of orientation characteristic (ORIPATHS A8=, B8=, C8=)

Changes of orientation that take place with constant acceleration on the contour can cause unwanted interruptions to the path motions, particularly at the corner of a contour. The resulting blip in the orientation characteristic can be smoothed by inserting a separate intermediate block. If ORIPATHS is active during reorientation, the change in orientation occurs at a constant acceleration. The tool can be retracted in this phase.

Machine manufacturer

Please refer to the machine manufacturer's notes on any predefined machine and setting data used to activate this function.

Machine data can be used to set how the retracting vector is interpreted:

1. In the TCS, the Z coordinate is defined by the tool direction.
2. In the WCS, the Z coordinate is defined by the active plane.

For further explanations about the "Orientation relative to the path" function, see

References:

Function Manual, Special Functions; Multi-axis Transformations (F2)

Syntax

Further programming details are needed at the corner of the contour for constant tool orientations relative to the path as a whole. The direction and path length of this motion is programmed via the vector using the components A8=X, B8=Y C8=Z.

N... ORIPATHS A8=X B8=Y C8=Z

Meaning

ORIPATHS:	Tool orientation relative to the path; blip in orientation characteristic is smoothed
A8= B8= C8=:	Vector components for direction and path length
X, Y, Z:	Retracting movement in tool direction

Note**Programming direction vectors A8, B8, C8**

If the length of this vector is exactly zero, no retracting movement is executed.

ORIPATHS

Tool orientation relative to the path is activated using ORIPATHS. The orientation is otherwise transferred from the start orientation to the end orientation by means of linear large-circle interpolation.

7.6 Compression of the orientation (COMPON, COMPCURV, COMPCAD, COMPSURF)

NC programs, in which orientation transformation (TRAORI) is active and tool orientations are programmed (no matter what type), can be compressed if kept within specified limits.

Programming

Tool orientation

If orientation transformation (TRAORI) is active, for 5-axis machines, tool orientation can be programmed in the following way (independent of the kinematics):

- Programming of the direction **vectors** via:
A3=<...> B3=<...> C3=<...>
- Programming of the Euler**angles** or RPY-**angles** via:
A2=<...> B2=<...> C2=<...>

Rotation of the tool

For **6-axis** machines you can program the tool rotation in addition to the tool orientation.

The angle of rotation is programmed with:

THETA=<...>

See " Rotation of tool orientation (Page 350) ".

Note

NC blocks, in which a rotation is also programmed, can only be compressed if the angle of rotation changes **linearly**. This means that it is not permissible that a polynomial with PO[THT]=(...) is programmed for the angle of rotation.

General structure of an NC block that can be compressed

The general structure of an NC block that can be compressed can therefore look like this:

N... X=<...> Y=<...> Z=<...> A3=<...> B3=<...> C3=<...> THETA=<...> F=<...>

or

N... X=<...> Y=<...> Z=<...> A2=<...> B2=<...> C2=<...> THETA=<...> F=<...>

Note

The position values can be entered directly (e.g. X90) or indirectly via parameter settings (e.g. X=R1*(R2+R3)).

Programming tool orientation using rotary axis positions

Tool orientation can be also specified using rotary axis positions, e.g. with the following structure:

N... X=<...> Y=<...> Z=<...> A=<...> B=<...> C=<...> THETA=<...> F=<...>

7.6 Compression of the orientation (*COMPON*, *COMPCURV*, *COMPCAD*, *COMPSURF*)

In this case, compression is executed in two different ways, dependent on whether large radius circular interpolation is executed. If no large radius circular interpolation takes place, then the compressed change in orientation is represented in the usual way by axial polynomials for the rotary axes.

Contour accuracy

Depending on the selected compression mode (MD20482 \$MC_COMPRESSOR_MODE) either the configured axis-specific tolerances (MD33100 \$MA_COMPRESS_POS_TOL) or the following channel-specific tolerances – set using setting data – are effective for the geometry axes and orientation axes for compression:

SD42475 \$SC_COMPRESS_CONTUR_TOL (maximum contour deviation)

SD42476 \$SC_COMPRESS_ORI_TOL (maximum angular deviation for tool orientation)

SD42477 \$SC_COMPRESS_ORI_ROT_TOL (maximum angular deviation for the angle of rotation of the tool) (only available on 6-axis machines)

References:

Function Manual Basic Functions; 3 to 5-Axis Transformation (F2),
Section: "Compression of the orientation"

Activation/deactivation

Compressor functions are activated by modal G commands *COMPON*, *COMPCURV*, *COMPCAD* or *COMPSURF*.

COMPOF terminates the compressor function.

See " NC block compression (*COMPON*, *COMPCURV*, *COMPCAD*) (Page 259) ".

Note

Orientation motion is only compressed when large radius circular interpolation is active (i.e. tool orientation is changed in the plane which is determined by start and end orientation).

Large radius circular interpolation is executed under the following conditions:

- MD21104 \$MC_ORI_IPO_WITH_G_CODE = 0,
ORIWKS is active and
the orientation is programmed as a vector (with A3, B3, C3 or A2, B2, C2).
- MD21104 \$MC_ORI_IPO_WITH_G_CODE = 1 and
ORIVECT or ORIPLANE is active.
The tool orientation can be programmed either as a direction vector or with rotary axis positions. No large radius circle interpolation is performed, if one of the G commands *ORICONxx* or *ORICURVE* is active, or if polynomials for orientation angle (*PO[PHI]* and *PO[PSI]*) are programmed.

7.6 Compression of the orientation (COMPON, COMPCURV, COMPCAD, COMPSURF)

Example

In the example program below, a circle approached by a polygon definition is compressed. The tool orientation moves on the outside of the taper at the same time. Although the programmed orientation changes are executed one after the other, but in an unsteady way, the compressor function generates a smooth motion of the orientation.

Programming	Comment
DEF INT NUMBER=60	
DEF REAL RADIUS=20	
DEF INT COUNTER	
DEF REAL ANGLE	
N10 G1 X0 Y0 F5000 G64	
\$SC_COMPRESS_CONTUR_TOL=0.05	; Maximum deviation of the contour = 0.05 mm
\$SC_COMPRESS_ORI_TOL=5	; Maximum deviation of the orientation = 5 degrees
TRAORI	
COMPCURV	; The movement describes a circle generated from polygons. The orientation moves on a taper around the Z axis with an opening an- gle of 45 degrees.
N100 X0 Y0 A3=0 B3=-1 C3=1	
N110 FOR COUNTER=0 TO NUMBER	
N120 ANGLE=360*COUNTER/NUMBER	
N130 X=RADIUS*cos(angle) Y=RADIUS*sin(angle)	
A3=sin(angle) B3=-cos(angle) C3=1	
N140 ENDFOR	

7.7 Activating/deactivating the orientation characteristic (ORISON, ORISOF)

The "Smoothing of the orientation characteristic" is activated/deactivated in the part program using the commands of G group 61. The commands are modal.

Preconditions

- System with 5/6-axis transformation.
- Compressor function COMPCAD is active.

Syntax

```
ORISON
...
ORISOF
```

Meaning

ORISON:	Activating the orientation characteristic smoothing
ORISOF:	Deactivating the orientation characteristic smoothing

Example

Program code	Comment
...	
TRAORI()	; Activation of orientation transformation.
COMPCAD	; Activating the COMPCAD compressor function.
ORISON	; Activating orientation smoothing.
\$SC_ORISON_TOL=1.0	; Maximum angular deviation of the tool orientation = 1.0 degrees.
G91	
X10 A3=1 B3=0 C3=1	
X10 A3=-1 B3=0 C3=1	
X10 A3=1 B3=0 C3=1	
X10 A3=-1 B3=0 C3=1	
X10 A3=1 B3=0 C3=1	
X10 A3=-1 B3=0 C3=1	
X10 A3=1 B3=0 C3=1	
X10 A3=-1 B3=0 C3=1	
X10 A3=1 B3=0 C3=1	
X10 A3=-1 B3=0 C3=1	
...	
ORISOF	; Deactivation of orientation smoothing.
...	

7.7 Activating/deactivating the orientation characteristic (ORISON, ORISOF)

The orientation is pivoted through 90 degrees on the XZ plane from -45 to +45 degrees. Due to the smoothing of the orientation characteristic the orientation is no longer able to reach the maximum angle values of -45 or +45 degrees.

7.8 Kinematic transformation

7.8.1 Activate face end transformation (TRANSMIT)

The front face transformation (TRANSMIT) is activated in the part program or synchronized action using the `TRANSMIT` statement.

Syntax

```
TRANSMIT
```

```
TRANSMIT (<n>)
```

Meaning

TRANSMIT:	Activate TRANSMIT with the first TRANSMIT data set
TRANSMIT (n):	Activate TRANSMIT with the nth TRANSMIT data set

Note

A TRANSMIT transformation active in the channel is activated with:

- Deactivate transformation: `TRAFOOF`
- Activation of another transformation: E.g. `TRACYL`, `TRAANG`, `TRAORI`

7.8.2 Activate cylinder surface transformation (TRACYL)

The cylinder surface transformation (TRACYL) is activated in the part program or synchronized action using the `TRACYL` statement.

Syntax

```
TRACYL (<d>)
```

```
TRACYL (<d>, <n>)
```

```
TRACYL (<d>, <n>, <k>)
```

Meaning

TRACYL (<d>):	Activate TRACYL with the first TRACYL data set and working diameter <d>
TRACYL (<d>, <n>):	Activate TRACYL with the <n>th TRACYL data set and working diameter <d>
<d>:	Reference or working diameter The value must be greater than 1.

<n>:	TRACYL data set number (optional)	
	Range of values:	1, 2
<k>:	The parameter <k> is only relevant for transformation type 514	
	k = 0:	without groove side correction
	k = 1:	with groove side correction
	If the parameter is not specified, then the parameterized basic position applies: \$MC_TRACYL_DEFAULT_MODE_<n> With <n> = TRACYL data set number	

Note

A TRACYL transformation active in the channel is switched-off with:

- Deactivate transformation: TRAFOOF
- Activation of another transformation: E.g. TRAANG, TRANSMIT, TRAORI

Example

Program code	Comment
...	
N40 TRACYL(40.)	; Activate TRACYL with the first TRACYL data set and working diameter 40 mm.
...	

Further information**Program structure**

A part program for milling a groove with TRACYL transformation 513 (TRACYL with groove side offset) generally comprises the following steps:

1. Select tool.
2. Select TRACYL.
3. Select suitable coordinate offset (frame).
4. Positioning.
5. Program OFFN.
6. Select TRC.
7. Approach block (position TRC and approach groove side).
8. Groove center line contour.
9. Deselect TRC.
10. Retraction block (retract TRC and move away from groove side).
11. Positioning.

12. TRAFOOF.

13. Reselect original coordinate shift (frame).

Contour offset (OFFN)

In order to mill grooves using TRACYL transformation 513, the center line of the groove and **half of the groove width** via the OFFN address are programmed in the part program.

To avoid damage to the groove side, OFFN acts only when the tool radius compensation is active.

It is possible to change OFFN within a part program. This allows the groove center line to be offset from the center:

Note

OFFN should be at least as large as the tool radius to avoid damage occurring to the opposite side of the groove wall.

Note

OFFN acts differently with TRACYL than it does without TRACYL. Since, even without TRACYL, OFFN is included when TRC is active, OFFN should be reset to zero after TRAFOOF.

NOTICE

Effect of OFFN depends on the transformation type

For TRACYL transformation 513 (TRACYL with groove side offset), half the groove width is programmed for OFFN.

For TRACYL transformation 512 (TRACYL with groove side offset), the value of OFFN acts as an allowance for the TRC.

Tool radius compensation (TRC)

For TRACYL transformation 513, the TRC is not taken into account relative to the groove side, but to the programmed center of the groove. In order that the tool travels to the left of the groove side, statement G42 must be programmed instead of G41 or the value of OFFN specified with a negative sign.

Tool diameter

With TRACYL and a tool whose diameter is less than the groove width, the same groove side geometry is not generated as with a tool whose diameter is the same as the groove width. To improve the precision, it is recommended that the tool diameter is selected to be only slightly less than the groove width.

Axis utilization**Note**

The following axes cannot be used as a positioning axis or a reciprocating axis:

- The geometry axis in the peripheral direction of the cylinder peripheral surface (Y axis).
- The additional linear axis for groove side compensation (Z axis).

7.8.3**Activating an oblique angle transformation with programmable angle (TRAANG)**

The oblique angle transformation with programmable angle is activated in the part program or synchronized action using the TRAANG statement.

Syntax

```
TRAANG
TRAANG ( )
TRAANG ( , <n> )
TRAANG ( <α> )
TRAANG ( <α> , <n> )
```

Meaning

TRAANG: TRAANG () :	Activate TRAANG with the first TRAANG data set and last valid angle <α>	
TRAANG (, <n>) :	Activate TRAANG with the <n>th TRAANG data set and last valid angle <α>	
TRAANG (<α>) :	Activate TRAANG with the first TRAANG data set and angle <α>	
TRAANG (<α> , <n>) :	Activate TRAANG with the <n>th TRAANG data set and angle <α>	
<α>:	Angle of the inclined axis (optional)	
	Range of values:	-90° < α < + 90°
	The initial state parameterized in the machine data is effective if an angle is not specified: MD2xxxx \$MC_TRAANG_ANGLE_<n>	

<n>:	TRAANG data set number (optional)	
	Range of values:	1, 2

Note

Oblique angle transformation TRAANG active in the channel is deactivated using:

- Deactivate transformation: TRAFOOF
- Activation of another transformation: E.g. TRACYL, TRANSMIT, TRAORI

Example

Program code	Comment
N20 TRAANG(45)	; Activate TRAANG with the first TRAANG data set and angle 45°

7.8.4 Oblique plunge-cutting on grinding machines (G5, G7)

The G commands G7 and G5 are used to simplify programming of oblique plunge-cutting on grinding machines with "inclined axis (TRAANG)", so that when plunge cutting, only the inclined axis is traversed.

Only the required end position of the plunge-cutting motion has to be programmed in X and Z. For G7, starting from the actual position of the X axis, the NC calculates and approaches the programmed end position and angle α of the inclined axis.

The starting position is calculated from the point where the two straight lines intersect:

- Straight line parallel to the Z axis, at a distance from the actual position of the X axis
- Straight line parallel to the inclined axis through the programmed end position

With the subsequent G5, the inclined axis is traversed to the programmed end position.

Syntax

```
G7 <Endpos_X> <Endpos_Z>
G5 <Endpos_X>
```

Meaning

G7:	Calculate the starting position for the oblique plunge-cutting and approach.
G5:	Traverse the inclined axis to the programmed end position
<Endpos_X>:	X axis end position
<Endpos_Z>:	End position of the Z axis

Example

- ① Parallel to the Z axis, at a distance from the actual position of the X axis
- ② Parallel to the inclined axis through the programmed end position
- ③ Starting position
- ④ Plunge-cutting: Starting position
- ⑤ Plunge-cutting: End position
- X Geometry axis
- Z Geometry axis
- ZM Machine axis
- UM Machine axis

Program code	Comment
N... G18	; Select XZ plane.
N40 TRAANG (45.0)	; Activate TRAANG transformation, angle = 45°
N50 G7 X40 Z70 F4000	; Calculate the starting position and approach
N60 G5 X40 F100	; Traverse inclined axis to the end position.
N70 ...	

7.9 Activate concatenated transformation (TRACON)

The TRAANG transformation is activated in the part program or synchronized action using the TRACON statement.

Syntax

```
TRACON(<Trafo_No>,<Par_1>,<Par_2>,...)
...
TRAFOOF
```

Meaning

TRACON:	Activate concatenated transformation If another transformation was previously activated, it is implicitly deactivated by TRACON () .			
<Trafo_No>:	Number of the concatenated transformation:			
	Type:	INT		
	Range of values:	0 ... 2		
	Value:	0, 1	First/only concatenated transformation	
		2	Second concatenated transformation	
		Not specified	Same meaning as with 0 or 1	
		Note: Values not equal to 0, 1, 2 generate an error alarm.		
<Par_1>,<Par_2>,...:	Parameters for the concatenated transformations (e.g. angle of the inclined axis) If parameters are not set, the defaults or the parameters last used take effect. Commas must be used to ensure that the specified parameters are evaluated in the sequence in which they are expected, if default settings are to be effective for previous parameters. In particular, a comma is required before at least one parameter, even though it is not necessary to specify <Trafo_No>. For example TRACON (, 3.7) . For TRACON with Transmit or TRAORI (5th axis machining) the second parameter Par_2 does not act as angle for the inclined axis. For TRACON with TRACYL (peripheral surface machining), Par is used for the unit diameter.			
TRAFOOF:	Deactivate the last activated (concatenated) transformation			

Example

Program code	Comment
...	
N230 TRACON(1,45.)	; Activate first concatenated transformation. ; The previously active transformation is automatically deselected. ; The parameter for the inclined axis is 45°.

7.9 Activate concatenated transformation (TRACON)

Program code	Comment
...	
N330 TRACON(2,40.)	; Activate second concatenated transformation. ; The parameter for the inclined axis is 40°.
...	
N380 TRAFOOF	; Deactivate second concatenated transformation.
...	

7.10 Cartesian PTP travel

7.10.1 Activating/deactivating Cartesian PTP travel (PTP, PTPG0, PTPWOC, CP)

The Cartesian point-to-point or PTP travel is activated/deactivated in the NC program using G group 49 commands.

The commands are modal. The default setting is travel with Cartesian path motion (CP).

Contrary to CP, for active PTP travel, only the Cartesian target point is transformed, and the machine axes are traversed in synchronism.

In order that the Cartesian target point can be uniquely converted into machine axis values, in addition to position and angular data, information is also necessary that identifies the axis positions. This data is retrieved from the adjustable addresses STAT (Page 373) and TU (Page 377).

Precondition

Transformation TRAORI, TRANSMIT, RCTRA or ROBX is active.

Syntax

```
PTP / PTPG0 / PTPWOC
...
CP
```

Meaning

PTP:	Activating point-to-point motion PTP The programmed Cartesian position in G0 and G1 blocks is approached with synchronous axis motion.
PTPG0:	Activating point-to-point motion PTPG0 Only in G0 blocks is the programmed Cartesian position approached with synchronous axis motion. In G1 blocks, a switchover is made to CP path motion.
PTPWOC:	Activate point-to-point movement PTPWOC (only possible if orientation transformation is active) Just the same as PTP, however, without any compensatory motion, which is caused by motion of rotary axes and orientation axes.
CP:	Deactivating point-to-point motion and activating path motion CP Cartesian path motion is executed with CP.

Note

PTPWOC

It does not make any sense to use PTPWOC in combination with a RCTRA or ROBX transformation!

Examples

See:

- Example 1: PTP travel of a 6-axis robot with ROBX transformation (Page 380)
- Example 2: PTP travel for generic 5-axis transformation (Page 381)
- Example 3: PTPG0 and TRANSMIT (Page 381)

7.10.2 Specify the position of the joints (STAT)

Position data with Cartesian coordinates and specification of the tool orientation is not sufficient in order to uniquely identify the machine position, as for the same tool orientation, several joint positions are possible. Depending on the kinematics involved, there can be as many as 8 different joint positions. These different joint positions are transformation-specific.

In an order to avoid any ambiguity, the joint positions are specified under the STAT address.

Note

The control only takes into account programmed STAT values for PTP motion. CP motion is ignored because when traversing with active transformation, a position change is normally not possible. When traversing with active CP, the position for the target point is taken from the starting point.

Syntax

STAT=<Value>

Meaning

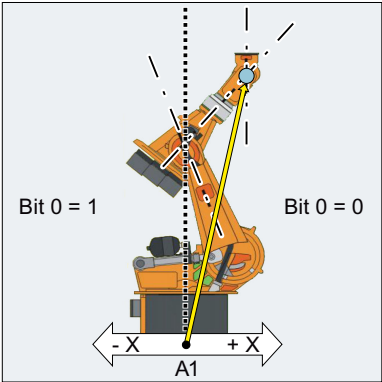

STAT:	Adjustable address to specify joint positions
<Value>:	Binary or decimal value Contains one bit for each possible position. The significance of the bits is defined by the particular transformation.

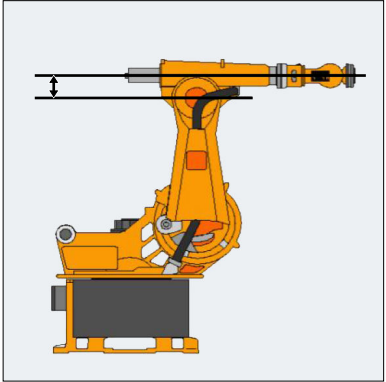

The use of STAT is to be explained using a 6-axis articulated robot with milling spindle. The kinematic transformation is to be realized using the ROBX robot transformation (precondition: compile cycle "RMCC/ROBX Transformation Extended Robotics" is loaded and active).

Axes A1, A2 and A3 are the main axes of the articulated robot. With the main axes, axes A4, A5 and A6 - which are also designated as head or hand/wrist axes, are positioned in the machining space. As a result of the additional hand/wrist axis motion, the milling spindle can be orientated in space as required for the particular machining task. Various articulated joint positions are possible to achieve the same tool orientation.

The articulated joint positions required for machining are selected by programming bit 0 ... 2 of the adjustable STAT address:

Bit 0			Position of the intersection points of the manual axes (A4, A5, A6)
	= 0	Basic range (shoulder right) The robot is in the basic range if the X value of the intersection point of the manual axes is positive referred to the A1 coordinate system.	 <p>Bit 0 = 1 Bit 0 = 0</p> <p>- X + X</p> <p>A1</p> <p>Example: The intersection point of the hand/wrist axes is located in the basic range</p>
	= 1	Overhead range (shoulder left) The robot is in the overhead range if the X value of the intersection point of the manual axes is negative referred to the A1 coordinate system.	

Bit 1	Position of axis 3	
	The angle where the value of bit 1 changes depends on the particular robot type. The following applies for robots whose axes 3 and 4 intersect:	
	= 0	$A3 < 0^\circ$ (elbow down)
	= 1	$A3 \geq 0^\circ$ (elbow up)
Note: For robots with an offset between axes 3 and 4, the angle where the value of bit 1 changes is dependent on the magnitude of this offset.		
Offset between A3 and A4		
Bit 2	Position of axis 5	
	= 0	$A5 \leq 0^\circ$ (no handflip)
	= 1	$A5 > 0^\circ$ (handflip)

Program example:

Program code	Comment
...	
N14 T="T8MILLD20" D1	; \$TC_DP3[1,1]=132.95
N16 ORIMKS	
N17 G1 PTP X1665.67 Y0 Z1377.405 A=0 B=0 C=0 STAT=... F2000	; The STAT value defines the articulated joint positions (see below)
...	

STAT=1 ('B001') → Shoulder Left
 → Elbow Down
 → No Handflip

STAT=2 ('B010')

- Shoulder Right
- Elbow Up
- No Handflip

STAT=5 ('B101')

- Shoulder Left
- Elbow Down
- Handflip

STAT=6 ('B110')

- Shoulder Right
- Elbow Up
- Handflip

TRANSMIT

For TRANSMIT, the STAT address is used to initiate the equivocality regarding the pole.

If the rotary axis must rotate through 180° or for CP, the contour would go through the pole, the following applies:

Bit 0	Only relevant for $\$MC_TRANSMIT_POLE_SIDE_FIX_1/2 = 1$ or 2 :	
	= 0	Rotary axis traverses through $+180^\circ$ or rotates clockwise.
	= 1	Rotary axis rotates through -180° or rotates counterclockwise.
Bit 1	Only relevant for $\$MC_TRANSMIT_POLE_SIDE_FIX_1/2 = 0$:	
	= 0	The axis traverses through the pole. The rotary axis does not rotate.
	= 1	The axis rotates around the pole. Bit 0 of STAT is relevant.

7.10.3 Specify the sign of the axis angle (TU)

In order that rotary axes can also approach axis angles exceeding $+180^\circ$ or less than -180° without requiring a special traversing strategy (e.g. intermediate point), the sign of the axis angle must be specified under the adjustable address TU.

Note

The control only takes into account programmed TU values for PTP motion. CP motion is ignored.

Syntax

TU=<Value>

Meaning

TU:	Adjustable address to specify axis angle signs		
<Value>:	Binary or decimal value		
	For each axis that is involved in the transformation, there is a bit that indicates the sign of the axis angle (θ), and therefore the traversing direction.		
	Bit	= 0	Axis angle sign: + Axis angular range: $0^\circ \leq \theta < 360^\circ$
		= 1	Axis angle sign: - Axis angular range: $-360^\circ < \theta < 0^\circ$

Example: 6-axis articulated robot

Bit	Meaning	Value	Axis angle sign	Axis angle
Bit 0 ¹⁾	Sign for the axis angle of A1	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$
Bit 1 ¹⁾	Sign for the axis angle of A2	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$
Bit 2 ¹⁾	Sign for the axis angle of A3	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$
Bit 3 ¹⁾	Sign for the axis angle of A4	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$
Bit 4 ¹⁾	Sign for the axis angle of A5	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$
Bit 5 ¹⁾	Sign for the axis angle of A6	= 0	+	$\geq 0^\circ$
		= 1	-	$< 0^\circ$

¹⁾ The actual TU bit numbers obtained from the channel axis numbers of the robot axes! In the example, robot axes (A1 to A6) are the first six axes in the channel; as a consequence, TU bits 0 ... 5 are used. For another channel axis assignment of the robot axes, the TU bit numbers of the robot axes would correspondingly change (e.g.: robot axes are the 3rd to 8th channel axis, i.e. TU bits 2 ... 7 are used for the robot axes).

TU=19 (corresponds to TU='B010011) would therefore signify:

Bit	Value		Axis angle
0	= 1	①	$\theta_{A1} < 0^\circ$
1	= 1	①	$\theta_{A2} < 0^\circ$

2	= 0	①	$\theta_{A3} \geq 0^\circ$
3	= 0	①	$\theta_{A4} \geq 0^\circ$
4	= 1	①	$\theta_{A5} < 0^\circ$
5	= 0	①	$\theta_{A6} \geq 0^\circ$

Note

In the case of axes with a traversing range $> \pm 360^\circ$, the axis always moves along the shortest path because the axis position cannot be specified uniquely by the TU information.

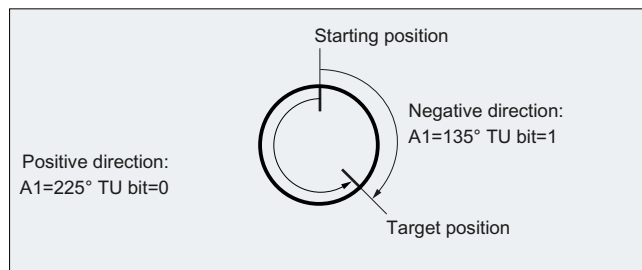

If no TU is programmed for a position, then depending on MD30455 \$MA_MISC_FUNCTION_MASK, the shorter or longer path is traversed (see Chapter "Taking into account the software limits for PTP travel" in the Extended Functions Function Manual).

TRANSMIT

For PTP travel with TRANSMIT active, the address of TU has no meaning!

Example

The rotary axis position shown in the following diagram can be approached in the negative or positive direction. The angular position is programmed under address A1. The traversing direction is only absolutely clear when TU is specified.

7.10.4 Example 1: PTP travel of a 6-axis robot with ROBX transformation

In the following application example, Cartesian PTP travel and the associated NC commands are shown in the form of an example.

7.10.5 Example 2: PTP travel for generic 5-axis transformation

Assumption: Right-angled CA kinematics used as basis.

Program code	Comment
TRAORI	;Transformation CA kinematics ON
PTP	; Activate PTP traversal
N10 A3=0 B3=0 C3=1	; rotary axis positions C=0 A=0
N20 A3=1 B3=0 C3=1	; rotary axis positions C=90 A=45
N30 A3=1 B3=0 C3=0	; rotary axis positions C=90 A=90
N40 A3=1 B3=0 C3=1 STAT=1	; rotary axis positions C=270 A=-45

Select clear approach position of rotary axis position:

In block N40, the rotary axes – as a result of the programming of **STAT=1** – travel the longer distance from their start point (C=90, A=90) to the end point (C=270, A=-45). On the other hand, with **STAT=0**, the rotary axes would travel along the shortest path to the end point (C=90, A=45).

7.11 Constraints when selecting a transformation

Function

Transformations can be selected via a part program or MDA. Please note:

- No intermediate movement block is inserted (chamfer/radii).
- Spline block sequences must be excluded; if not, a message is displayed.
- Fine tool compensation must be deselected (FTOCOF); if not a message is displayed.
- Tool radius compensation must be deselected (G40); if not a message is displayed.
- An activated tool length offset is included in the transformation by the control.
- The control deselects the current frame active before the transformation.
- The control deselects an active operating range limit for axes affected by the transformation (corresponds to WALIMOF).
- Protection zone monitoring is deselected.
- Continuous path control and rounding are interrupted.
- All the axes specified in the machine data must be synchronized relative to a block.
- Axes that are exchanged are exchanged back; if not, a message is displayed.
- A message is output for dependent axes.

Tool change

Tools may only be changed when the tool radius compensation function is deselected.

A change in tool length offset and tool radius compensation selection/deselection must not be programmed in the same block.

Frame change

All statements, which refer exclusively to the base coordinate system, are permissible (FRAME, tool radius compensation). However, a frame change with G91 (incremental dimension) – unlike with an inactive transformation – is not handled separately. The increment to be traveled is evaluated in the workpiece coordinate system of the new frame – regardless of which frame was effective in the previous block.

Exceptions

Axes affected by the transformation cannot be used

- as a preset axis (alarm),
- for approaching a checkpoint (alarm),
- for referencing (alarm).

7.12 Deselecting a transformation (TRAFOOF)

The predefined TRAFOOF procedure deactivates all active transformations and frames.

Note

For deselecting the transformation, the same secondary conditions (Page 383) apply as for selecting.

Frames required after this must be activated by renewed programming.

Syntax

```
...
TRAFOOF
```

Meaning

TRAFOOF:	Deactivating all active transformations/frames
----------	--

Kinematic chains

8.1 Deletion of components (DELOBJ)

The `DELOBJ()` function "deletes" components by resetting the assigned system variables to their default values:

- Elements from kinematic chains
- Protection areas, protection area elements and collision pairs
- Transformation data

Syntax

```
[<RetVal>=] DELOBJ (<CompType> [ , , , <NoAlarm> ] )  
[<RetVal>=] DELOBJ (<CompType> , <Index1> [ , , <NoAlarm> ] )  
[<RetVal>=] DELOBJ (<CompType> [ , <Index1> ] [ , <Index2> ] [ , <NoAlarm> ] )
```

Meaning

DELOBJ:	Deletion of elements from kinematic chains, protection areas, protection area elements, collision pairs and transformation data	
<CompType>:	Component type to be deleted	
	Data type:	STRING
	Value: "KIN_CHAIN_ELEM"	
	Meaning: System variables of all kinematic elements: \$NK_...	
	Value: "KIN_CHAIN_SWITCH"	
	Meaning: System variable \$NK_SWITCH[<i>]]	
	Value: "KIN_CHAIN_ALL"	
	Meaning: All kinematic elements and switches. Is the same as the successive call of DELOBJ with "KIN_CHAIN_ELEM" and "KIN_CHAIN_SWITCH"	
	Value: "PROT_AREA"	
	Meaning: System variables of the protection areas:	
	<ul style="list-style-type: none"> • \$NP_PROT_NAME • \$NP_CHAIN_NAME • \$NP_CHAIN_ELEM • \$NP_1ST_PROT 	
	Value: "PROT_AREA_ELEM"	
	Meaning: System variables of the protection area elements of machine protection areas and/or automatic tool protection areas:	
	<ul style="list-style-type: none"> • \$NP_NAME • \$NP_NEXT • \$NP_NEXTP • \$NP_COLOR • \$NP_D_LEVEL • \$NP_USAGE • \$NP_TYPE • \$NP_FILENAME • \$NP_PARA • \$NP_OFF • \$NP_DIR • \$NP_ANG 	
	Value: "PROT_AREA_COLL_PAIRS"	
	Meaning: System variables of the collision pairs:	
	<ul style="list-style-type: none"> • \$NP_COLL_PAIR • \$NP_SAFETY_DIST 	
	Value: "PROT_AREA_ALL"	
	Meaning: All protection areas, protection area elements and collision pairs (system variable \$NP_...) Is the same as the successive call of DELOBJ with "PROT_AREA," "PROT_AREA_ELEM," and "PROT_AREA_COLL_PAIRS"	
	Value: "TRAFO_DATA"	
	Meaning: System variables of all transformations \$NT_...	

<Index1>:	Index of the first component to be deleted (optional)	
	Data type:	INT
	Default value:	-1
	Range of values:	$-1 \leq x \leq (\text{maximum number of configured components} - 1)$
	Value	Meaning
	0, 1, 2,	Index of the component to be deleted.
	-1	All components of the specified type are deleted. <Index2> is not evaluated.
<Index2>:	Index of the last components to be deleted (optional) If <Index2> is not programmed, only the system variables of the component referenced in <Index1> are deleted.	
	Data type:	INT
	Default value:	Only the system variables of the component referenced in <Index1> are deleted.
	Range of values:	$\text{<Index1>} < x \leq (\text{max. number of configured components} - 1)$
<NoAlarm>:	Alarm suppression (optional)	
	Data type:	BOOL
	Default value:	FALSE
	Value	Meaning
	FALSE	In the event of an error (<RetVal> < 0), program processing is stopped and an alarm displayed.
	TRUE	In the event of an error, the program processing is not stopped and no alarm displayed. Application: User-specific reaction corresponding to the return value
<RetVal>:	Function return value	
	Data type:	INT
	Range of values:	0, -1, -2, ... -7
	Value	Meaning
	0	No error occurred.
	-1	Call of the function without parameters. At least parameter <CompType> must be specified.
	-2	<CompType> identifies an unknown component
	-3	<Index1> is less than -1
	-4	<Index1> is greater than the configured number of components
	-5	<Index1> has a value not equal to -1 when deleting a component group
	-6	<Index2> is less than <Index1>
	-7	<Index2> is greater than the configured number of components

8.2 Index determination by means of names (NAMETOINT)

User-specific names are entered in the system variable arrays of type STRING. Based on the identifier of the system variables and the name, the `NAMETOINT()` function determines the index value belonging to the name under which it is stored in the system variable array.

Syntax

```
<RetVal> = NAMETOINT(<SysVar>,<Name>[,<NoAlarm>])
```

Meaning

NAMETOINT:	Determining the system variable index	
<SysVar>:	Name of the system variable array of type STRING	
	Data type:	STRING
	Range of values:	Name of all NC system variable arrays of type STRING
<Name>:	Character string or name for which the system variable index is to be determined.	
	Data type:	STRING
<NoAlarm>:	Alarm suppression (optional)	
	Data type:	BOOL
	Default value:	FALSE
	Value	Meaning
	TRUE	In the event of an error, the program processing is not stopped and no alarm displayed. Application: User-specific reaction corresponding to the return value
	FALSE	In the event of an error (<RetVal> < 0), program processing is stopped and an alarm displayed.
<RetVal>:	System variable index or error message	
	Data type:	INT
	Range of values:	$-1 \leq x \leq (\text{max. number of configured components} - 1)$
	Value	Meaning
	≥ 0	The sought name has been found under the specified system variable index.
	-1	The sought name has not been found or an error has occurred.

Example

Program code	Comment
DEF INT INDEX	
\$NP_PROT_NAME[27]="Cover"	
...	
INDEX = NAMETOINT("\$NP_PROT_NAME","Cover")	; INDEX == 27

Collision avoidance with kinematic chains

Note**Protection areas**

The protection areas specified in the following chapters refer to the "Geometric machine modeling" function

References:

Function Manual, Special Functions, Chapter "Geometric machine modeling"

9.1 Check for collision pair (COLLPAIR)

The `COLLPAIR()` function determines whether two protection areas form a collision pair.

Syntax

```
[<RetVal> =] COLLPAIR(<Name_1>,<Name_2>[,<NoAlarm>])
```

Meaning

COLLPAIR:	Check whether part of a collision pair		
<RetVal>:	Function return value		
	Data type:	INT	
	Value:	≥ 0	The two protection zones form a collision pair. Return value == collision pair index m (see \$NP_COLL_PAIR)
		-1	Either two strings have not been specified or at least one of the two is the zero string.
		-2	The protection zone specified in the first parameter has not been found.
		-3	The protection zone specified in the second parameter has not been found.
		-4	Neither of the two specified protection zones has been found.
		-5	Both specified protection zones have been found, but not together in a collision pair.
<Name_1>:	Name of the first protection zone		
	Data type:	STRING	
	Range of values:	Parameterized protection zone names	
<Name_2>:	Name of the second protection area		
	Data type:	STRING	
	Range of values:	Parameterized protection zone names	
<NoAlarm>:	Alarm suppression (optional)		
	Data type:	BOOL	
	Value:	FALSE (Default)	In the event of an error (<RetVal> < 0), the program processing is stopped and an alarm displayed.
		TRUE	In the event of an error, the program processing is not stopped and no alarm displayed. Application: User-specific reaction corresponding to the return value

9.2 Request recalculation of the machine model of the collision avoidance (PROTA)

If system variables of the kinematic chain \$NK_..., the geometric machine modeling or the collision avoidance \$NP_... are written in the part program, the `PROTA` procedure must subsequently be called so that the change becomes effective in the NC-internal machine model of the collision avoidance.

Syntax

`PROTA[(<Par>)]`

Meaning

<code>PROTA:</code>	Request recalculation of the machine model of the collision avoidance		
	<ul style="list-style-type: none"> Triggers a preprocessing stop. Must be alone in the block. 		
<code><Par>:</code>	Parameter (optional)		
	Data type:	STRING	
	Value:	---	No parameters. The machine model is recalculated. The states of the protection areas are retained.
		"R"	The machine model is recalculated. The protection areas are set to their initialization status corresponding to \$NP_INIT_STAT.

Supplementary conditions

Simulation

The `PROTA` procedure must not be used in part programs in conjunction with the simulation (`simNC`).

Example: Avoiding the `PROTA` call while the simulation is active.

Program code	Comment
...	
IF \$P_SIM == FALSE	; IF simulation not active
PROTA	THEN recalculate collision model
ENDIF	; ENDIF
...	

See also

Setting the protection zone status (PROTS) (Page 392)

9.3 Setting the protection zone status (PROTS)

The PROTS () procedure sets the state of protection areas to the specified value.

Syntax

```
PROTS (<State>[, <Name_1>, ..., <Name_n>])
```

Meaning

PROTS:	Sets the state of protection areas		
	• Must be alone in the block.		
<State>:	Status to which the specified protection zones are to be set		
	Data type:	CHAR	
	Value:	"A"or "a"	Status: Active
		"I"or "i"	Status: Inactive
		"P"or "p"	Status: Preactivated or PLC-controlled ¹⁾
		"R"or "r"	Status: NC-internal value of the initialization status ²⁾
<Name_1> ... <Name_n>:	Name of one or more protection areas that are to be set to the specified status (optional)		
	If no name is specified, the specified status is set for all defined protection zones.		
	Data type:	STRING	
	Range of values:	Parameterized protection zone names	
	Note		
	The maximum number of protection areas that can be specified as parameters depends only on the maximum possible number of characters per program line.		

¹⁾ The activation/deactivation is performed via: DB10.DBX234.0 - DBX241.7

²⁾ The status is set to the NC-internal value of the initialization status, i.e. to the value that the system variable \$NP_INIT_STAT had at the time of the last PROTA() (Page 391) call.

9.4 Determining the clearance of two protection zones (PROTD)

The `PROTD()` function calculates the clearance of two protection areas.

Function properties:

- The clearance calculation is performed independent of the protection area status (activated, deactivated, preactivated).
- To calculate the clearance of two protection areas, only protection area elements are used, which are marked with `$NP_USAGE = "C"` or `"A"`. Protection area elements of the protection area, which are marked with `$NP_USAGE = "V"`, are not taken into consideration.
- Protection areas, where all protection area elements of the protection area are marked with `$NP_USAGE = "V"`, cannot be used for the clearance calculation.
- The clearance calculation is performed with the positions valid at the end of the previous block.
- Overlays that are included in the main run calculation (e.g. DRF offset or external zero offset) are included in the clearance calculation with the values valid at the function **interpretation time**.

Note

Synchronization

When using the `PROTD()` function, it is the sole responsibility of the user to synchronize the main run and preprocessing, if required, with the `STOPRE` preprocessing stop.

Collision

If there is a collision between the specified protection areas, the function returns a clearance of 0.0. There is a collision if both the protection areas touch or intersect each other.

The safety clearance for the collision check (MD10622 `$MN_COLLISION_SAFETY_DIST`) is not taken into account in the clearance calculation.

Syntax

```
[<RetVal> =] PROTD([<Name_1>], [<Name_2>], VAR <Vector>[, <System>])
```

Meaning

PROTD:	Calculates the clearance of the two specified protection areas.	
	<ul style="list-style-type: none"> • Must be alone in the block. 	
<RetVal>:	Function return value: Absolute clearance value of the two protection areas or 0.0 with collision (see above: Collision paragraph)	
	Data type:	REAL
	Range of values:	$0.0 \leq x \leq +\text{max. REAL value}$

9.4 Determining the clearance of two protection zones (PROTD)

<Name_1>, <Name_2>:	Names of the two protection areas whose clearance is to be calculated (optional)		
	Data type:	STRING	
	Range of values:	Parameterized protection area names	
	Default value:	"" (empty string) If no protection areas have been specified, the function calculates the current smallest clearance from all the activated and preactivated protection areas in the collision model.	
<Vector>:	Return value: 3-dimensional clearance vector from protection area <Name_2> to protection area <Name_1> with: <ul style="list-style-type: none">• <Vector>[0]: X coordinate in the world coordinate system• <Vector>[1]: Y coordinate in the world coordinate system• <Vector>[2]: Z coordinate in the world coordinate system For collision: <Vector> == zero vector		
	Data type:	VAR REAL [3]	
	Range of values:	<Vector> [n]: 0.0 ≤ x ≤ ±max. REAL value	
<System>:	Measuring system (inch/metric) for clearance and clearance vector (optional)		
	Data type:	BOOL	
	Value:	FALSE (Default)	Measuring system corresponding to the currently active G command from G group 13 (G70, G71, G700, G710).
		TRUE	Measuring system corresponding to the set basic system: MD52806 \$MN_ISO_SCALING_SYSTEM

Transformation with kinematic chains

10.1 Activating a transformation (TRAFOON)

A transformation defined with kinematic chains is activated with the predefined TRAFOON procedure. The call must be alone in a block.

Note

Alternatively, a transformation defined with kinematic chains can also be activated via conventional NC commands, such as TRAORI or TRANSMIT. For this purpose, an appropriate value, not equal to zero, must be entered in the \$NT_TRAFO_INDEX system variable.

For further information on \$NT_TRAFO_INDEX see "System Variables List Manual".

Syntax

TRAFOON (<Trafoname>, <Diameter>, <k>)

Meaning

TRAFOON:	Procedure for activating a transformation defined with kinematic chains	
<Trafoname>:	Name of the transformation data set	
	Data type:	STRING
	Range of values:	All names of transformation data sets defined via \$NK_NAME
	Note: The name of the transformation data set must be unique. It must only occur once in \$NT_NAME.	
<Diameter>:	Reference or working diameter (TRACYL only)	
	Data type:	REAL
	The value must be > 1.	
<k>:	Defines the use of the groove side offset (TRACYL only).	
	Data type:	BOOL
	Value:	FALSE Without groove side offset
		TRUE With groove side offset
	Corresponds to the TRACYL transformation type 514 (groove side offset can be programmed). If <k> is not specified, the parameterized setting of bit 10 in \$NT_CNTRL[<n>] applies.	

Example

Program code	Comment
TRAFOON["Trans_1"]	Activates the transformation with the name Trans_1.

10.2 Modifying the orientation transformation after the machine measurement (CORRTRAFO)

For machines with orientation transformations that were defined by means of kinematic chains, the user can use the predefined CORRTRAFO function in order to modify the offset vectors or the direction vectors of the orientation axes in the kinematic model of the machine after a machine measurement.

Syntax

```
<Corr_Status> = CORRTRAFO(<Corr_Vect>, <Corr_Index>, <Corr_Mode> [,  
<No_Alarm>])
```

10.2 Modifying the orientation transformation after the machine measurement (CORRTrafo)**Meaning**

CORRTrafo:	Function call
------------	---------------

10.2 Modifying the orientation transformation after the machine measurement (CORRTrafo)

<Corr_Status>:	Function return value	
	Data type:	INT
	Values:	0 The function was executed without an error.
		1 No transformation is active.
		2 The currently active transformation is not an orientation transformation.
		3 The active orientation transformation was not defined with kinematic chains.
		10 The <Corr_Index> call parameter is negative.
		11 The <Corr_Mode> call parameter is negative.
		12 Invalid reference to a section of a subchain (unit position of <Corr_Index>). The value must not be greater than the number of orientation axes in the subchain.
		13 Invalid reference to the orientation axis of a subchain (unit position of <Corr_Index>). The value must be less than the number of orientation axes in the subchain.
		14 Invalid reference to a subchain (tens position of <Corr_Index>). Only the values 0 and 1 are permissible (reference to part or tool chain). This error number occurs if the subchain to which <Corr_Index> refers does not exist.
		15 There is no correction element in the section referred to with the <Corr_Index> parameter (\$NT_CORR_ELEM_P or \$NT_CORR_ELEM_T).
		20 Invalid correction mode (unit position of <Corr_Mode>). Only the values 0 and 1 are permissible.
		21 Invalid correction mode (tens and/or hundreds position of <Corr_Mode>). Only the unit position can be not equal to zero when writing an axis direction.
		30 The hundreds position of <Corr_Mode> is invalid. Only the values 0 and 1 are permissible.
		31 The thousands position of <Corr_Mode> is invalid. Only the values 0 and 1 are permissible.
		40 The direction vector that is to be taken as axis direction is the zero vector. This error can only happen if the thousands position of <Corr_Mode> is equal to 0. If the thousands position of this parameter is equal to 1 (monitoring of the maximum correction deactivated), the zero vector can also be written.
		41 For the correction of an offset vector, the difference to the current value in at least one coordinate is greater than the maximum value specified by the setting data SD41610 \$SN_CORR_TRAFO_LIN_MAX. The <Corr_Vect> parameter will be overwritten by an error vector. This also applies when the processing is aborted with alarm (see <No_Alarm> parameter).
		In the components whose correction value has exceeded the permissible limit, the error vector has the difference, with the correct sign, between the determined correction value and the limit.
		The content of the components that have not exceeded their limit is zero.

10.2 Modifying the orientation transformation after the machine measurement (CORRTrafo)

		42	For the correction of a direction vector, the angular displacement compared to the current direction is greater than the maximum value specified by the setting data SD41611 \$SN_CORR_TRAFO_DIR_MAX.																
		43	The attempt to write a system variable was rejected because of missing write rights.																
<Corr_Vect>:	<p>Correction vector</p> <p>The content of the correction vector is defined by the following parameters <Corr_Index> and <Corr_Mode>.</p> <p>If <Corr_Status> = 41, the content of the vector is overwritten (see above).</p> <table><tr><td>Data type:</td><td>REAL</td></tr></table>			Data type:	REAL														
Data type:	REAL

Tens position:	Refers to the subchain.																		
	0x	Workpiece chain																	
	1x	Tool chain																	

10.2 Modifying the orientation transformation after the machine measurement (CORRTrafo)

<Corr_Mode>:	Correction mode	
	Data type:	INT
	The <Corr_Index> parameter is decimal coded (unit to thousands position):	
	Unit position:	Specifies which element is to be corrected.
		xxx0 Correction of a linear offset vector
		xxx1 Correction of the direction vector of an orientation axis
	Tens position:	Specifies how the correction element to which the content of <Corr_Index> refers, is to be modified.
		xx0x The correction vector is written immediately to the correction element. This variant can be used to immediately write the correction element without the index <n> of the relevant system data (\$NK_OFF_DIR[<n>, ...]) having to be known.
		xx1x As 0, but with the difference that the transferred correction value is interpreted in world coordinates. A difference between variants 0 and 1 can always occur when the kinematic chain in the initial state (positions of all orientation axes equal to 0) contains other rotations.
		xx2x As 1, but with the difference that the correction value refers to the entire section, i.e. a value is entered in the correction element so that the entire section reaches the length defined by the correction value.
		Note: The values 1 and 2 are not permissible when writing the direction vector of an orientation axis.
	Hundreds position:	Specifies how the content of the <Corr_Vect> parameter is to be interpreted.
		x0xx The transferred correction vector <Corr_Vect> contains the entire new length of the correction element or the section to which the <Corr_Index> in conjunction with the tens position of <Corr_Mode> refers (absolute correction).
		x1xx The transferred correction vector <Corr_Vect> only contains the difference compared to the current length of the correction element or the section to which the <Corr_Index> in conjunction with the tens position of <Corr_Mode> refers (incremental correction).
		Note: For the correction of the direction vector of an orientation axis, the content of the hundreds position must be 0.
	Thousands position:	Specifies whether the correction is to be limited by the following maximum value: <ul style="list-style-type: none"> SD41610 \$SN_CORR_TRAFO_LIN_MAX or SD41611 \$SN_CORR_TRAFO_DIR_MAX
		0xxx Monitoring of the maximum correction is active.
		1xxx Monitoring of the maximum correction is not active.

10.2 Modifying the orientation transformation after the machine measurement (CORRTRAFO)

<No_Alarm>:	Behavior in the event of an error (return value > 0) (optional)		
	Data type:	BOOL	
	Value:	FALSE (default)	In the event of an error, the program processing is stopped and alarm 14103 is displayed.
		TRUE	In the event of an error, the program processing is not stopped and no alarm is displayed. Application: User-specific reaction corresponding to the return value

Note

In the event of an error when the function is called, either an alarm is output or an error number returned (see <No_Alarm> parameter), so that the user can respond in a suitable way to the error state. The cause of the error is described in more detail through an alarm parameter. An error number returned instead of an alarm is identical to the alarm parameter.

Further information on CORRTRAFO

The kinematic structure of a machine with orientation transformation is described by one or two kinematic chains (subchains), starting from the zero point of the world coordinate system. One of the two chains, the **tool chain**, ends at the reference point of the tool, the other chain, the **workpiece chain** ends in the zero point of the basic coordinate system.

The CORRTRAFO function measures lever arm lengths and axis directions on machines with orientation transformation and writes these values into special correction elements. A kinematic chain is described, for example, with elements of the type OFFSET, which are defined via \$ NK_TYPE.

CORRTRAFO works with sections

The two subchains can each be divided into a maximum of four sections:

- Section 1 begins at the starting point of the chain and ends at the first orientation axis.
- Section 2 is the section between orientation axis 1 and orientation axis 2.
- Section 3 is the section between orientation axis 2 and orientation axis 3.
- Section 4 is the section between orientation axis 3 and the end of the tool or workpiece chain.

Each section may contain constant chain elements of the type OFFSET or ROT_CONST.

The following figure shows an orientation transformation with 2 orientation axes.

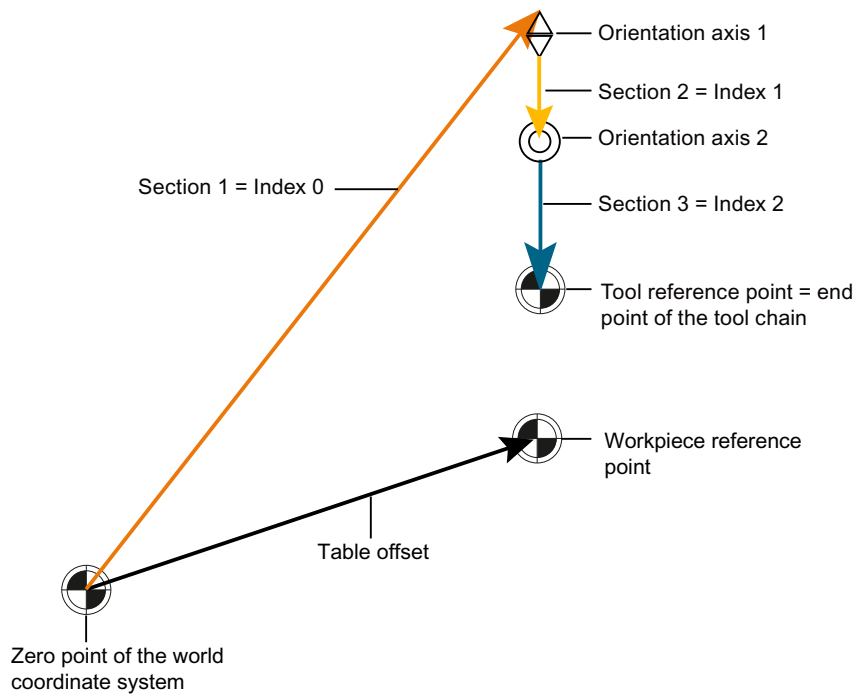

Figure 10-1 CORRTRAFO example

The sections are clearly defined: If you run through the kinematic subchain from the starting point to the end point, the first section has the index 0, the next the index 1, and so on. The index of the last section is then always equal to the number of orientation axes.

Correction elements

A reference can be made to a constant kinematic chain element (chain element of the type `$NK_TYPE[<n>] = "OFFSET"`) in each section with the `$NT_CORR_ELEM_T[<n>, 0 ... 3]` or `$NT_CORR_ELEM_P[<n>, 0 ... 3]` system variables. The correction values that were determined during the machine measurement are written to these elements with the CORRTRAFO function.

Example with transformation index = 1:

- `$NT_CORR_ELEM_T[1,0] = "C_AXIS_OFFSET"`; Offset of the C axis (orientation axis 1) in section 1 is defined as correction element.
- `$NT_CORR_ELEM_T[1,1] = "B_AXIS_OFFSET"`; Offset of the B axis (orientation axis 2) in section 2 is defined as correction element.
- `$NT_CORR_ELEM_T[1,2] = "BASE_TOOL_OFFSET"`; Offset of the B axis from the tool reference point in section 3 is defined as correction element.

The sequence of the references in `$NT_CORR_ELEM_T/P[<n>, 0 ... 3]` must correspond to the sections described above, i.e. only one chain element can be in `$NT_CORR_ELEM_T/P[<n>, 0]` which is before the first orientation axis, etc.

The CORRTRAFO function writes the values determined by measuring the machine into the correction elements defined in this way. The modification of the correction values is defined in CORRTRAFO via the `<Corr_Mode>` parameter.

10.2 Modifying the orientation transformation after the machine measurement (CORRTRAFO)

Closing a chain

If bit 7 or bit 8 are set in the \$NT_CNTRL[<n>] system variable, additional constant chain elements that establish a connection from the end point of the chain to the machine zero point are automatically inserted internally at the end of the workpiece chain (bit 7) or before the starting point of the tool chain (bit 8) ("close chain").

These automatically inserted elements cannot be written externally, only read (see the \$AC_TRAFO_CORR_ELEM_P/T system variables).

Point to close the tool chain

If the \$NT_CLOSE_CHAIN_T system variable is not empty, the tool chain is not closed at the end point of the chain, but rather at the end point of the designated chain element. Other chain elements that are behind this point result in a corresponding work offset when the transformation is activated.

Index of an orientation axis

In addition to the constants offsets between the orientation axes, the direction vectors of the orientation axes can also be written with the CORRTRAFO function. The index of an orientation axis is the index that results when the kinematic subchain is run through from the origin to the end, where the count starts at zero. The index of an orientation axis is therefore always the same as the index of the preceding section.

The index of an orientation axis can also be determined with the \$AC_TRAFO_ORIAX_LOC system variable.

Maximum permissible change of a chain element

The maximum permissible change of a chain element can be limited by the two setting data SD41610 \$SN_CORR_TRAFO_LIN_MAX for offset vectors and SD41611 \$SN_CORR_TRAFO_DIR_MAX for direction vectors of the orientation axes. SD41610 \$SN_CORR_TRAFO_LIN_MAX specifies the maximum amount by which each individual vector component can be changed with regard to its reference value. SD41611 \$SN_CORR_TRAFO_DIR_MAX specifies the maximum angle by which the direction of the axis vector can be changed with regard to its reference value. The reference value is always the corresponding value that is active in the transformation that is active when CORRTRAFO is called. This means that the changed content of the kinematic data may have no effect on the method of operation of the CORRTRAFO function after the activation of the transformation.

Tool offsets

11.1 Offset memory

Structure of the offset memory

Every data field can be invoked with a T and D number (except "Flat D No."); in addition to the geometrical data for the tool, it contains other information such as the tool type.

Flat D number structure

The "Flat D No. structure" is used if tool management takes place outside the NC. In this case, the D numbers are created with the corresponding tool compensation blocks without assignment to tools.

T can continue to be programmed in the part program. However, this T has no reference to the programmed D number.

User cutting edge data

User cutting edge data can be configured via machine data. Please refer to the machine manufacturer's instructions.

Tool parameters

Note

Individual values in the offset memory

The individual values of the offset memory P1 to P25 can be read and written by the program via system variables. All other parameters are reserved.

The tool parameters \$TC_DP6 to \$TC_DP8, \$TC_DP10 and \$TC_DP11 as well as \$TC_DP15 to \$TC_DP17, \$TC_DP19 and \$TC_DP20 have another meaning depending on tool type.

Tool parameter number (DP)	Meaning of system variables	Remark
\$TC_DP1	Tool type	For overview see list
\$TC_DP2	Cutting edge position	Only for turning tools
Geometry	Length compensation	
\$TC_DP3	Length 1	Allocation to
\$TC_DP4	Length 2	Type and level
\$TC_DP5	Length 3	
Geometry	Radius	
\$TC_DP6 ¹⁾	Radius 1 / length 1	Milling/turning/grinding tool
\$TC_DP6 ²⁾	diameter d	Slotting saw
\$TC_DP7 ¹⁾	Length 2 / corner radius, tapered milling tool	Milling tools
\$TC_DP7 ²⁾	Slot width b corner radius	Slotting saw

11.1 Offset memory

Tool parameter number (DP)	Meaning of system variables	Remark
\$TC_DP8 ¹⁾	Rounding radius 1 for milling tools	Milling tools
\$TC_DP8 ²⁾	projecting length k	Slotting saw
\$TC_DP9 ^{1) 3)}	Rounding radius 2	Reserved
\$TC_DP10 ¹⁾	Angle 1 face end of tool	Tapered milling tools
\$TC_DP11 ¹⁾	Angle 2 tool longitudinal axis	Tapered milling tools
Wear	Length and radius compensation	
\$TC_DP12	Length 1	
\$TC_DP13	Length 2	
\$TC_DP14	Length 3	
\$TC_DP15 ¹⁾	Radius 1 / length 1	Milling/turning/grinding tool
\$TC_DP15 ²⁾	diameter d	Slotting saw
\$TC_DP16 ¹⁾	Length 2 / corner radius, tapered milling tool, slot width	Milling tools
\$TC_DP16 ³⁾	b corner radius	Slotting saw
\$TC_DP17 ¹⁾	Rounding radius 1 for milling tools	Milling / 3D face milling
\$TC_DP17 ²⁾	projecting length k	Slotting saw
\$TC_DP18 ^{1) 3)}	Rounding radius 2	Reserved
\$TC_DP19 ¹⁾	Angle 1 face end of tool	Tapered milling tools
\$TC_DP20 ¹⁾	Angle 2 tool longitudinal axis	Tapered milling tools
Tool base dimension/ adapter	Length offsets	
\$TC_DP21	Length 1	
\$TC_DP22	Length 2	
\$TC_DP23	Length 3	
Technology		
\$TC_DP24	Clearance angle	Only for turning tools
\$TC_DP25		Reserved

¹⁾ Also applies with milling tools for 3D face milling

²⁾ For slotting saw tool type

³⁾ Reserved (is not used by SINUMERIK 840D sl)

Remarks

Several entry components are available for geometric variables (e.g. length 1 or radius). These are added together to produce a value (e.g. total length 1, total radius), which is then used for the calculations.

Offset values not required must be assigned the value zero.

Tool parameters \$TC-DP1 to \$TC-DP23 with contour tools**Note**

The tool parameters not listed in the table, such as \$TC_DP7, are not evaluated, i.e. their content is meaningless.

Tool parameter number (DP)	Meaning	Cutting Dn		Remark
\$TC_DP1	Tool type			400 to 599
\$TC_DP2	Cutting edge position			
Geometry	Length compensation			
\$TC_DP3	Length 1			
\$TC_DP4	Length 2			
\$TC_DP5	Length 3			
Geometry	Radius			
\$TC_DP6	Radius			
Geometry	Limit angle			
\$TC_DP10	Minimum limit angle			
\$TC_DP11	Maximum limit angle			
Wear	Length and radius compensation			
\$TC_DP12	Wear length 1			
\$TC_DP13	Wear length 2			
\$TC_DP14	Wear length 3			
\$TC_DP15	Wear radius			
Wear	Limit angle			
\$TC_DP19	Wear min. limit angle			
\$TC_DP20	Wear max. limit angle			
Tool base dimension/ adapter	Length offsets			
\$TC_DP21	Length 1			
\$TC_DP22	Length 2			
\$TC_DP23	Length 3			

Basic value and wear value

The resultant values are each a total of the basic value and wear value (e.g. \$TC_DP6 + \$TC_DP15 for the radius). The basic measurement (\$TC_DP21 – \$TC_DP23) is also added to the tool length of the first cutting edge. All the other parameters, which may also impact on effective tool length for a standard tool, also affect this tool length (adapter, orientational toolholder, setting data).

Limit angles 1 and 2

Limit angles 1 and 2 each relate to the vector of the cutting edge center point to the cutting edge reference point and are counted clockwise.

11.2 Additive offsets

11.2.1 Selecting additive offsets (DL)

Additive offsets can be considered as process offsets that can be programmed in the machining. They refer to the geometrical data of a cutting edge and are therefore a component of tool cutting data.

Data of an additive offset is addressed using a DL number (DL: Locationdependent; offsets regarding the location of use) and entered via the user interface.

Application

Dimension errors caused by the location of use can be compensated using additive offsets.

Syntax

DL=<number>

Meaning

DL:	Command to activate an additive offset
<number>:	The additive tool offset data to be activated is specified using the <number> parameter

Note

The machine data is used to define the number of additive offsets and also activate them (→ carefully observe the machine OEM's data!).

Example

The same cutting edge is used for two bearing seats:

Program code	Comment
N110 T7 D7	; The revolver is positioned to location 7. D7 and DL=1 are activated and moved through in the next block.
N120 G0 X10 Z1	
N130 G1 Z-6	
N140 G0 DL=2 Z-14	; DL=2 is activated in addition to D7 and is moved through in the next block.
N150 G1 Z-21	
N160 G0 X200 Z200	; Approach tool change point.
...	

11.2.2 Specify wear and setup values (\$TC_SCPxy[t,d], \$TC_ECPxy[t,d])

Wear and setting-up values can be read and written to using system variables. The logic is based on the logic of the corresponding system variables for tools and tool noses.

System variables

\$TC_SCPxy[<t>,<d>]:	Wear values that are assigned to the particular geometry parameters via xy, whereby x corresponds to the number of the wear value and y establishes the reference to the geometry parameter.
\$TC_ECPxy[<t>,<d>]:	Setting-up values that are assigned to the particular geometry parameter via xy, whereby x corresponds to the number of the setting-up value and y establishes the reference to the geometry parameter.
<t>: T number of the tool	
<d>: D number of the tool cutting edge	

Note

The defined wear and setup values are added to the geometry parameters and the other offset parameters (D numbers).

Example

The wear value of length 1 is set to the value of 1.0 for the cutting edge <d> of tool <t>.

Parameter: \$TC_DP3 (length 1, with turning tools)

Wear values: \$TC_SCP13 to \$TC_SCP63

Setup values: \$TC_ECP13 to \$TC_ECP63

\$TC_SCP43 [<t>,<d>] = 1.0

11.2.3 Delete additive offsets (DELDL)

The **DELDL** command deletes the additive offsets for the cutting edge of a tool (to release memory space). Both the defined wear values and the setup values are deleted.

Syntax

```
DELDL [<t>,<d>]
DELDL [<t>]
DELDL
<Status>=DELDL [<t>,<d>]
```

Meaning

DELDL:	Command to delete additive offsets	
<t>:	T number of the tool	
<d>:	D number of the tool cutting edge	
DELDL [<t>,<d>]:	All additive offsets of the cutting edges <d> of the tool <t> are deleted.	
DELDL [<t>]:	All additive offsets of all cutting edges of tool <t> are deleted.	
DELDL:	All additive offsets of all cutting edges of all tools of the TO unit are deleted (for the channel in which the command is programmed).	
<Status>:	Delete status	
	Value:	Meaning:
	0	Deletion was successfully completed.
	-	Offsets have not been deleted (if the parameter settings specify exactly one tool edge), or not deleted completely (if the parameter settings specify several cutting edges).

Note

Wear and setting-up values of active tools cannot be deleted (essentially the same as the delete behavior of D or tool data).

11.3 Special handling of tool offsets

The evaluation of the sign for tool length and wear can be controlled using setting data SD42900 to SD42960.

The same applies to the behavior of the wear components when mirroring geometry axes or changing the machining plane, and also to temperature compensation in tool direction.

Wear values:

If reference is made to wear values in the following, then this should be understood as the sum of the actual wear values (\$TC_DP12 to \$TC_DP20) and the sum offsets with the wear values (\$SCPX3 to \$SCPX11) and setting-up values (\$ECPX3 to \$ECPX11).

For more information about summed offsets, refer to:

References:

Function Manual, Tool Management

Setting data

SD42900 \$SC_MIRROR_TOOL_LENGTH	Mirroring of tool-length components and components of the tool base dimension.
SD42910 \$SC_MIRROR_TOOL_WEAR	Mirroring of wear values of the tool-length components.
SD42920 \$SC_WEAR_SIGN_CUTPOS	Evaluating the sign of the wear components as a function of the cutting edge position.
SD42930 \$SC_WEAR_SIGN	Inverts the sign of wear dimensions.
SD42935 \$SC_WEAR_TRANSFORM	Transformation of wear values.
SD42940 \$SC_TOOL_LENGTH_CONST	Assignment of tool length components to geometry axes.
SD42950 \$SC_TOOL_LENGTH_TYPE	Assignment of the tool length components independent of tool type.
SD42960 \$SC_TOOL_TEMP_COMP	Temperature compensation value in tool direction. Also operative when tool orientation is programmed.

References

Function Manual Basic Functions; Tool Offset (W1)

Further information

Activation of modified setting data

When the setting data described above is modified, the tool components are not reevaluated until the next time a tool edge is selected. If a tool is already active and the data of this tool is to be reevaluated, the tool must be selected again.

The same applies in the event that the resulting tool length is modified due to a change in the mirroring status of an axis. The tool must be selected again after the mirror command, in order to activate the modified tool-length components.

Orientable toolholders and new setting data

Setting data SD42900 to SD42940 has no effect on the components of an active toolholder with orientation capability. However, the calculation with an orientable toolholder always allows for a tool with its total resulting length (tool length + wear + tool base dimension). All modifications initiated by the setting data are included in the calculation of the resulting total length, i.e. vectors of the orientable toolholder are independent of the machining plane.

Note

When orientable toolholders are used, it is frequently practical to define all tools for a non-mirrored basic system, even those which are only used for mirrored machining. When machining with mirrored axes, the toolholder is then rotated such that the actual position of the tool is described correctly. All tool-length components then automatically act in the correct direction, dispensing with the need for control of individual component evaluation via setting data, depending on the mirroring status of individual axes.

Further application options

The use of orientable toolholder functionality can also be useful if there is no physical option of turning tools on the machine, even though tools with different orientations are permanently installed. Tool dimensioning can then be performed uniformly in a basic orientation, where the dimensions relevant for machining are calculated according to the rotations of a virtual toolholder.

11.3.1 Mirroring of tool lengths

When setting data SD42900 \$SC_MIRROR_TOOL_LENGTH and SD42910 \$SC_MIRROR_TOOL_WEAR are not set to zero, then you can mirror the tool length components and components of the basis dimensions with wear values and their associated axes.

SD42900 \$SC_MIRROR_TOOL_LENGTH

Setting data **not equal to zero**:

The tool length components (\$TC_DP3, \$TC_DP4 and \$TC_DP5) and the components of the basis dimensions (\$TC_DP21, \$TC_DP22 and \$TC_DP23) are mirrored against their associated axes, also mirrored – by inverting the sign.

The wear values are **not** mirrored. If these are also to be mirrored, then setting data SD42910 \$SC_MIRROR_TOOL_WEAR must be set.

SD42910 \$SC_MIRROR_TOOL_WEAR

Setting data **not equal to zero**:

The wear values of the tool length components - whose associated axes are mirrored - are also mirrored by inverting the sign.

11.3.2 Wear sign evaluation

When setting data SD42920 \$SC_WEAR_SIGN_CUTPOS and SD42930 \$SC_WEAR_SIGN are set not equal to zero, then you can invert the sign evaluation of the wear components.

SD42920 \$SC_WEAR_SIGN_CUTPOS

Setting data **not equal to zero**:

For tools with the relevant cutting edge position (turning and grinding tools, tool types 400), then the sign evaluation of the wear components in the machining plane depends on the cutting edge position. This setting data is of no significance for tool types without relevant cutting edge position.

In the following table, the dimensions, whose sign is inverted using SD42920 (not equal to zero), are designed using an X:

Cutting edge position	Length 1	Length 2
1		
2		X
3	X	X
4	X	
5		
6		
7		X
8	X	
9		

Note

The sign evaluation using SD42920 and SD42910 are independent of one another. If, for example, the sign of a dimension is changed using both setting data, then the resulting sign remains unchanged.

SD42930 \$SC_WEAR_SIGN

Setting data **not equal to zero**:

Inverts the sign of all wear dimensions. This affects both the tool length and other variables such as tool radius, rounding radius, etc.

If a positive wear dimension is entered, the tool becomes "shorter" and "thinner", refer to Chapter "tool offset, special handling", activating changed setting data".

11.3.3 Coordinate system of the active machining operation (TOWSTD, TOWMCS, TOWWCS, TOWBCS, TOWTCS, TOWKCS)

Depending on the kinematics of the machine or the availability of an orientable tool carrier, the wear values measured in one of these coordinate systems are converted or transformed to a suitable coordinate system.

Coordinate systems of active machining operation

The following coordinate systems produce tool length offsets which the tool length wear component incorporates in an active tool via the corresponding G command of Group 56:

- Machine coordinate system (MCS)
- Basic coordinate system (BCS)
- Workpiece coordinate system (WCS)
- Tool coordinate system (TCS)
- Tool coordinate system of kinematic transformation (KCS)

Syntax

TOWSTD
TOWMCS
TOWWCS
TOWBCS
TOWTCS
TOWKCS

Meaning

TOWSTD:	Initial setting value for offsets in tool length wear value
TOWMCS:	Offsets in tool length in MCS
TOWWCS:	Offsets in tool length in WCS
TOWBCS:	Offsets in tool length in BCS
TOWTCS:	Offsets in tool length at tool carrier reference point (orientable tool carrier)
TOWKCS:	Compensations of tool length for tool head (kinematic transformation)

Further information

Distinguishing features

The most important distinguishing features are shown in the following table:

G command	Wear value	Active orientable tool carrier
TOWSTD:	Initial value, tool length	Wear values are subject to rotation.
TOWMCS:	Wear value in MCS. TOWMCS is identical to TOWSTD if a tool carrier that can be orientated is not active.	It only rotates the vector of the resultant tool length without taking into account the wear.
TOWWCS:	The wear value is converted to the MCS in the WCS.	The tool vector is calculated as for TOWMCS without taking into account the wear.
TOWBCS:	The wear value is converted to the MCS in the BCS.	The tool vector is calculated as for TOWMCS without taking into account the wear.
TOWTCS:	The wear value is converted to the MCS in the workpiece coordinate system.	The tool vector is calculated as for TOWMCS without taking into account the wear.

TOWWCS, TOWBCS, TOWTCS: The wear vector is added to the tool vector.

Linear transformation

The tool length can be defined meaningfully in the MCS only if the MCS is generated by linear transformation from the BCS.

Non-linear transformation

For example, if with TRANSMIT a non-linear transformation is active, then when specifying the MCS as requested coordinate system, BCS is automatically used.

No kinematic transformation and no orientable tool carrier

If neither a kinematic transformation nor an orientable tool carrier is active, then all the other four coordinate systems (except for the WCS) are combined. It is then only the WCS, which is different to the other systems. Since only tool lengths need to be evaluated, translations between the coordinate systems are irrelevant.

References:

For more information on tool compensation, see:
Function Manual Basic Functions; Tool Offset (W1)

Inclusion of wear values in calculation

The setting data SD42935 \$SC_WEAR_TRANSFORM defines which of the three wear components:

- Wear
- Total offsets fine
- Total offsets coarse

should be subject to a rotation using adapter transformation or a tool carrier that can be orientated if one of the following G commands is active:

- TOWSTD
Basic position. For corrections in the tool length.
- TOWMCS
Wear values in the machine coordinate system (MCS).
- TOWWCS
Wear values in the workpiece coordinate system (WCS).
- TOWBCS
Wear values in the basic coordinate system (BCS).
- TOWTCS
Wear values in the tool coordinate system at the tool carrier fixture (T tool carrier reference).
- TOWKCS
Wear values in the coordinate system of the tool head for kinematic transformation.

Note

Evaluation of individual wear components (assignment to geometry axes, sign evaluation) is influenced by the following factors:

- Active plane
 - Adapter transformation
 - Setting data:
 - SD42910 \$SC_MIRROR_TOOL_WEAR
 - SD42920 \$SC_WEAR_SIGN_CUTPOS
 - SD42930 \$SC_WEAR_SIGN
 - SD42940 \$SC_TOOL_LENGTH_CONST
 - SD42950 \$SC_TOOL_LENGTH_TYPE
-

11.3.4 Tool length and plane change

When setting data SD42940 \$SC_TOOL_LENGTH_CONST is set not equal to zero, then you can assign the tool length components – such as lengths, wear and basic dimension – to the geometry axes for turning and grinding tools when changing the plane.

SD42940 \$SC_TOOL_LENGTH_CONST

Setting data **not equal to zero**:

The assignment of tool length components (length, wear and tool base dimension) to geometry axes does not change when the machining plane is changed (G17 - G19).

The following table shows the assignment of tool length components to geometry axes for turning and grinding tools (tool types 400 to 599):

Content	Length 1	Length 2	Length 3
17	Y	X	Z
*)	X	Z	Y

11.3 Special handling of tool offsets

19	Z	Y	X
-17	X	Y	Z
-18	Z	X	Y
-19	Y	Z	X

*) Each value not equal to 0, which is not equal to one of the six listed values, is evaluated as value 18.

The following table shows the assignment of tool length components to geometry axes for all other tools (tool types < 400 or > 599):

Operating plane	Length 1	Length 2	Length 3
*)	Z	Y	X
18	Y	X	Z
19	X	Z	Y
-17	Z	X	Y
-18	Y	Z	X
-19	X	Y	Z

*) Each value not equal to 0, which is not equal to one of the six listed values, is evaluated as value 17.

Note

For representation in tables, it is assumed that geometry axes up to 3 are designated with X, Y, Z. The axis order and not the axis identifier determines the assignment between a compensation and an axis.

11.4 Online tool offset

11.4.1 Defining a polynomial function (FCTDEF)

Certain dressing strategies (e.g. dressing roller) are characterized by the fact that the grinding wheel radius is continuously (linearly) reduced as the dressing roller is fed in. This strategy requires a linear function between infeed of the dressing roller and writing the wear value of each length. The linear function is defined using the predefined procedure FCTDEF(...) for up to third order polynomial functions.

Straight line equation

$$y = f(x) = a_0 + a_1 \cdot x_1$$

a_1 : Gradient of the straight line, with $a_1 = \Delta x / \Delta y$

a_0 : Shift of the straight line along the X axis with $a_0 = -a_1 \cdot X_v$

Syntax

FCTDEF(<Func>,<LLimit>,<ULimit>,<a0>,<a1>,<a2>,<a3>)

Meaning

FCTDEF(...):	Defining a polynomial function for PUTFTOCF(...): $y = f(x) = a_0 + a_1 \cdot x + a_2 \cdot x^2 + a_3 \cdot x^3$	
<Func>:	Function number	
	Data type:	INT
	Range of values:	1, 2, 3
<LLimit>:	Lower limit value	
	Data type:	REAL
<ULimit>:	Upper limit value	
	Data type:	REAL
<a0>,<a1>,<a2>,<a3>:	Coefficients of polynomial function	
	Data type:	REAL

Example

Definitions

- Function number: 1
- Lower and upper limit value: -100, 100
- Gradient of the characteristic: $a_1 = 1$
- The operating point should be located at the center of the characteristic. Based on the setpoint position of axis XA in the WCS at the instant that the function is defined in the NC program, the characteristic must be shifted in the negative Y direction: $a_0 = -a_1 \cdot XA_D = -1 \cdot \AA_IW
- $a_2 = a_3 = 0$

Characteristic

UL Upper limit value

LL Lower limit value

XA_D Setpoint of axis XA at the time that the function is defined in the NC program

Programming

Program code	Comment
FCTDEF(1,-100,100,-\$AA_IW[XA],1)	; Function definition

11.4.2 Write online tool offset continuously (PUTFTOCF)

Using the predefined procedure PUTFTOCF(...), an online tool offset is executed based on a polynomial function previously defined with FCTDEF(...) (Page 419).

Note

The online tool offset can also be realized using a synchronized action.

For further information, see Function Manual Synchronized Actions.

Syntax

```
PUTFTOCF (<Func>, <RefVal>, <ToolPar>, <Chan>, <Sp>)
```

Meaning

PUTFTOCF (...):	Write online tool offset, continuously block-by-block using the polynomial function defined with FCTDEF(...)	
<Func>:	Function number, defined in the function definition with FCTDEF(...)	
	Data type:	INT
	Range of values:	1, 2, 3
<RefVal>:	Reference value, from which the offset is to be derived (e.g. setpoint of an axis).	
	Data type:	VAR REAL
<ToolPar>:	Number of the wear parameter (length 1, 2 or 3) in which the offset value is to be included.	
	Data type:	INT
<Chan>:	Number of the channel in which the online tool offset is to take effect.	
	Note: Only required if the offset is not to take effect in the active channel.	
	Data type:	INT
<Sp>:	Number of the spindle for which the online tool offset is to take effect.	
	Note: Only required if the offset is to be applied to a non-active grinding wheel rather than the active tool that is currently in use.	
	Data type:	INT

11.4.3 Write online tool offset, discrete (PUTFTOC)**Function**

Using the predefined procedurePUTFTOC(...), an online tool offset is executed based on a fixed offset value.

Syntax

```
PUTFTOC (<CorrVal>, <ToolPar>, <Chan>, <Sp>)
```

Meaning

PUTFTOC (...):	Write online tool offset	
<CorrVal>:	Offset value, which is added to the wear parameter.	
	Data type:	REAL
<ToolPar>:	Number of the wear parameter (length 1, 2 or 3) in which the offset value is to be included.	
	Data type:	INT

<Chan>:	Number of the channel in which the online tool offset is to take effect.	
	Note: Only required if the offset is not to take effect in the active channel.	
	Data type:	INT
<Sp>:	Number of the spindle for which the online tool offset is to take effect.	
	Note: Only required if the offset is to be applied to a non-active grinding wheel rather than the active tool that is currently in use.	
	Data type:	INT

11.4.4 Activate/deactivate online tool offset (FTOCON/FTOCOF)

The online tool offset is activated or deactivated using the G commands FTOCON and FTOCOF.

Syntax

```
FTOCON
...
FTOCOF
```

Meaning

FTOCON:	Activate online tool offset The command must be programmed in the channel in which the online tool offset is to be activated.
FTOCOF:	Deactivate online tool offset The command must be programmed in the channel in which the online tool offset is to be deactivated. Note: On FTOCOF, the axis does not move further out for the tool offset. However, the value calculated with PUTFTOC/PUTFTOCF remains in the cutting-specific offset data. To finally deactivate the online tool offset, the tool (T...) must again be selected/deselected after FTOCOF.

11.5 3D tool radius compensation

11.5.1 Selecting 3D tool radius compensation for 3D circumferential milling (CUT3DC, CUT3DCD, ISD)

The 3D tool radius compensation (3D TRC) for the 3D circumferential milling without taking limitation surfaces into account is selected with the modally effective G command CUT3DC or CUT3DCD.

The actual activation is performed with G41 or G42. The tool radius compensation is deactivated with G40.

Syntax

```
G41/G42 ORIC/ORID ISD=... CUT3DC/CUT3DCD CDOF2 X... Y... Z...
...
G40 X... Y... Z...
```

Meaning

CUT3DC:	3D TRC for circumferential milling (only when 5-axis transformation is active)	
CUT3DCD:	3D TRC for circumferential milling referred to a differential tool (only when 5-axis transformation is active) The radius difference is specified by the tool parameter \$TC_DP15.	
G41/G42 X... Y... Z...:	Activate tool radius compensation	
	G41:	Tool radius compensation left of the contour
	G42:	Tool radius compensation right of the contour
	Note: The activation must be performed in a linear block (G0/G1).	
CDOF2:	Deactivate collision detection for 3D circumferential milling	
ORIC/ORID:	The behavior for orientation changes at outside corners is specified via the G commands ORIC and ORID.	
	ORIC:	Orientation changes at outside corners are superimposed on the circle block to be inserted.
	ORID:	Orientation changes at outside corners are executed before the circle block to be inserted.
ISD=<Value>:	With the ISD address, the insertion depth of the tool can be changed for circumferential milling and active 3D tool radius compensation.	
	<Value>:	Length of the insertion depth
G40 X... Y... Z...:	Deactivate tool radius compensation Note: The deactivation must be performed in a linear block (G0/G1) with geometry axis movements.	

Note

The G commands for selecting the 3D TRC are evaluated in the approach block, i.e. typically in the block that contains G41 or G42.

G41 or G42 can also be programmed in blocks without traversing movement in geometry axes relevant for the compensation. In this case, the approach block is the first traversing block following such a block.

A change of the 3D TRC variant with active tool radius compensation is ignored without alarm.

Example

Program code	Comment
	; Definition of tool D1:
\$TC_DP1[1,1]=120	; Type (end mill)
\$TC_DP3[1,1]=20	; Length compensation vector
\$TC_DP6[1,1]=8	; Radius
N10 X0 Y0 Z0 T1 D1 F12000	; Selection of the tool.
N20 TRAORI(1)	; Activation of the transformation.
N30 G42 ORIC ISD=10 CUT3DC G64 X30	; Activation of the 3D circumferential milling, ; continuous orientation changes at outside corners, ; insertion depth: 10 mm
N40 ORIWKS A30 B15	; Orientation change at a corner through specification of axis positions.
N50 Y20 A3=1 C3=1	; Traversing block with orientation change, ; specification of the orientation with direction vector.
N60 X50 Y30	; Traversing block with constant orientation.
N70 Y50 A3=0.5 B3=1 C3=5	; Traversing block with orientation change.
N80 M63	; Block without traversing information.
N90 X0 ISD=20	; Traversing block with change of the insertion depth.
N100 G40 Y0	; Deactivation of the tool radius compensation.
N110 M30	

Further information**Path and orientation**

The type of circumferential milling used here is implemented by defining a path (guide line) and the associated orientation. In this type of machining, the shape of the tool on the path is not relevant. Only the radius at the tool intervention point is decisive.

Figure 11-1 Circumferential milling

Approach behavior

The approach behavior is always NORM for the 3D variant of the tool radius compensation.

Behavior at outside corners

The G commands of group 18 (corner behavior, tool offset) are evaluated at the outside corners for circumferential milling with 3D TRC in the same way as for the conditions for the 2½D TRC:

- G450: Transition circle (tool travels round workpiece corners on a circular path)
In contrast to the solution for the 2½D TRC, the inserted contour element at an outside corner is always a circle with a 0 radius, on which the tool radius compensation acts in the same way as on any other programmed path. It is not possible to insert conics instead of circles. In this case, the DISC address has no significance and is therefore not evaluated.
- G451: Intersection of equidistant paths (tool backs off from the workpiece corner)
The intersection is determined by extending the offset curves of the two participating blocks and defining the intersection of the two blocks at the corner in the plane perpendicular to the tool orientation.

The intersection procedure (G451) is not used when at least one block containing a change to the tool orientation was inserted between the relevant traversing blocks. In this case, a circle is always inserted at the corner.

Behavior for changes in orientation at outside corners

The ORIC and ORID G commands are used to determine whether changes in orientation programmed between two blocks forming the corner are executed before the inserted circle block (ORID) is processed or at the same time (ORIC).

Insertion depth

The insertion depth of the milling tool is the distance of the milling tool reference point from the tip of the tool.

The milling tool reference point is the vertical projection of the milling tool machining point on the programmed path to the longitudinal axis of the tool.

The position of the machining point on the peripheral surface of the tool is set with the insertion depth.

- ① Programmed path
- ② Milling tool machining point
- ③ Milling tool reference point
- ④ Milling tool tip
- ISD Insertion depth (InSertion Depth)

Figure 11-2 Insertion depth

Tool radius compensation referred to a differential tool

3D TRC for circumferential milling referred to a differential tool is activated via the CUT3DCD command. It should be applied if the programmed contour refers to the center-point path of a standard tool, and a tool other than a differential tool is used for machining. When calculating the 3D tool radius compensation, only the wear value of the radius of the active tool (\$TC_DP15) and any programmed tool offsets OFFN and TOFFR are taken into account. The basic radius (\$TC_DP6) of the active tool is **not** taken into account.

Pocket milling with inclined side walls for circumferential milling with CUT3DC

In this 3D tool radius compensation, a deviation of the mill radius is compensated by infeed toward the surface normals to be machined. The plane, in which the milling tool face is located, remains unchanged if the insertion depth ISD has remained the same. For example, a milling tool with a smaller radius than a standard tool would not reach the pocket base, which is also the limitation surface. For automatic tool infeed, this limitation surface must be known to the control, see Section "3D circumferential milling taking into account a limitation surface (CUT3DCC, CUT3DCCD) (Page 432)".

Advanced Surface / Top Surface**Note**

When applying tool radius compensation CUT3DCD in combination with the "Advanced Surface" or "Top Surface" option (requiring a license), the setting recommendations regarding "Advanced Surface" / "Top Surface" must be observed.

Special test programs are provided in the SIOS portal for checking the set data:

- Test programs for Advanced Surface (<https://support.industry.siemens.com/cs/ww/en/view/78956392>)
- Test programs for Top Surface (<https://support.industry.siemens.com/cs/ww/en/view/109738423>)

11.5.2 Selecting 3D tool radius compensation for the 3D face milling (CUT3DF, CUT3DFS, CUT3DFF, CUT3DFD)

The 3D tool radius compensation (3D TRC) for the 3D face milling is selected with the modally effective G command CUT3DF, CUT3DFS, CUT3DFF or CUT3DFD.

The actual activation is performed with G41 or G42

With 3D face milling, the surface normals of the plane to be machined must be defined in order to calculate the tool radius compensation. This must be performed in the block with G41 or G42 via the A4, B4, C4 and A5, B5, C5 addresses.

The tool radius compensation is deactivated with G40.

Syntax

```
G41/G42 ORIC/ORID CUT3DF/CUT3DFS/CUT3DFF/CUT3DFD X... Y... Z... A4=... B4=...
C4=... A5=... B5=... C5=...
...
G40 X... Y... Z...
```

Meaning

CUT3DFS:	3D TRC for face milling with constant orientation. The tool orientation is defined by G17 - G19 and is not influenced by frames.
CUT3DFF:	3D TRC for face milling with constant orientation. The tool orientation is the direction defined by G17 - G19 and, in some case, rotated by a frame.
CUT3DF:	3D TRC for face milling with orientation change (only with active 5-axes transformation)

11.5 3D tool radius compensation

CUT3DFD:	3D TRC for face milling with orientation change referred to a differential tool (only with active 5-axis transformation) The radius difference is specified by the tool parameter \$TC_DP15. Note: CUT3DFD is only possible in combination with "Smoothing of surface normals in 3D face milling". This is activated by calling the "Top Surface" function (requires as license) via CYCLE832(...) (Page 777).	
G41/G42 X... Y... Z...:	Activate tool offset The behavior with G41 and with G42 is identical for 3D face milling. Note: The activation must be performed in a linear block (G0/G1).	
A4/5=... B4/5=... C4/5=...:	Definition of the surface normals of the plane to be machined	
	A4=... B4=... C4=...:	Definition at start of block
	A5=... B5=... C5=...:	Definition at end of block
ORIC/ORID:	The behavior for orientation changes at outside corners is specified via the G commands ORIC and ORID.	
	ORIC:	Orientation changes at outside corners are superimposed on the circle block to be inserted.
	ORID:	Orientation changes are performed before the circle block.
G40 X... Y... Z...:	Deactivate tool radius compensation Note: The deactivation must be performed in a linear block (G0/G1) with geometry axis movements.	

Note

G41 or G42 can also be programmed in blocks without traversing movement in geometry axes relevant for the compensation. In this case, the approach block is the first traversing block following such a block.

A change of the 3D TRC variant with active tool radius compensation is ignored without alarm.

Note

For 3D face milling with CUT3DFD, the definition of the surface normal is required for activating the tool offset with G41/G42. Programming of G41/G42 without definition of the surface normals leads to the output of an alarm.

Further information**3D face milling**

For this type of 3D milling, you require the line-by-line description of the 3D paths on the workpiece surface. The tool shape and dimensions are taken into account in the calculations, which are normally performed in CAM. The postprocessor writes to the part program - in addition to NC blocks - the tool orientations (for active 5-axis transformation) and the G command for the required 3D tool offset. This means that the machine operator has the possibility of using tools that are slightly smaller - deviating from the tool used to calculate the NC paths.

Figure 11-3 Face milling

Approach behavior

The approach behavior is always NORM for the 3D variant of the tool radius compensation.

Behavior at outside corners

Outside corners are treated as circles with radius 0 for face milling, whereby the circle plane extends from the end tangent of the first block to the start tangent of the second block. In this way, the orientation can be changed during block transition. A circle is therefore always inserted as contour element at an outside corner. The intersection procedure is not available with face milling.

Behavior for changes in orientation at outside corners

The ORIC and ORID G commands are used to determine whether changes in orientation programmed between two blocks forming the corner are executed before the inserted circle block (ORID) is processed or at the same time (ORIC).

Tool radius compensation referred to a differential tool

3D tool radius compensation referring to a differential tool is selected using the CUT3DFD command. It should be applied if the programmed contour refers to the center-point path of a standard tool, and a tool other than a differential tool is used for machining. When calculating the 3D tool radius compensation, only the wear value of the radius of the active tool (\$TC_DP15) and any programmed tool offsets OFFN and TOFFR are taken into account. The basic radius (\$TC_DP6) of the active tool is **not** taken into account.

3D face milling with CUT3DFD is only possible in combination with "Smoothing of surface normals in 3D face milling". This is activated by calling the "Top Surface" function (requires as license) via CYCLE832(...) (Page 777). Activation must take place **before** the tool offset is activated with G41/G42; not directly before tool intervention, but rather one path length before that, which corresponds to approx. 1000 times the contour tolerance (e.g. 1000 x 0.01 mm = 10 mm). Deactivation must be executed in reverse order: First switch off the tool offset with G40, then deactivate with e.g. CUT2D (or similar) after a path length which corresponds with approximately 1000 time the contour tolerance.

In order to be able to use the "Smoothing of surface normals in 3D face milling", the "Interpolation of surface normals via polynomials" function must also be enabled:

```
MD28291 $MC_MM_SMOOTH_SURFACE_NORMALS = TRUE
```

Note

For 3D face milling with CUT3DFD in combination with "Top Surface", the setting recommendations regarding "Top Surface" must be observed.

Special test programs are provided (<https://support.industry.siemens.com/cs/ww/en/view/109738423>) in the SIOS portal for checking the set data.

11.5.3 3D circumferential milling taking into account a limitation surface (CUT3DCC, CUT3DCCD)

In 3D circumferential milling with a continuous or constant change in tool orientation, the tool center-point path is frequently programmed for a defined standard tool. Because in practice suitable standard tools are often not available, a tool that does not deviate too much from a standard tool ($\leq 5\%$) can be used.

CUT3DCCD takes account of a limitation surface for a real differential tool that the programmed standard tool would define. The NC program defines the center-point path of a standard tool.

CUT3DCC with the use of cylindrical tools takes account of a limitation surface that the programmed standard tool would have reached. The NC program defines the contour on the machining surface.

The surface normal vector of the limitation surface is specified with A4, B4, C4 and A5, B5, C5 for 3D face milling.

Syntax

```
G41/G42 CUT3DCCD/CUT3DCC CDOF2 X... Y... Z... A4=... B4=... C4=... A5=... B5=...
C5=...
...
G40 X... Y... Z...
```

Meaning

CUT3DCCD:	3D TRC for the circumferential milling taking into account a limitation surface with a differential tool on the tool center-point path: Infeed to the limitation surface	
CUT3DCC:	3D TRC for the circumferential milling taking into account a limitation surface with 3D radius compensation: Contour on the machining surface	
G41/G42 X... Y... Z...:	Activate tool radius compensation	
	G41:	Tool radius compensation left of the contour
	G42:	Tool radius compensation right of the contour
	Note: The activation must be performed in a linear block (G0/G1).	
CDOF2:	Deactivate collision detection for 3D circumferential milling	
A4/5=... B4/5=... C4/5=...:	Definition of the surface normals of the limitation surface	
	A4=... B4=... C4=...:	Definition at start of block
	A5=... B5=... C5=...:	Definition at end of block
G40 X... Y... Z...:	Deactivate tool radius compensation	
	Note: The deactivation must be performed in a linear block (G0/G1) with geometry axis movements.	

Note

The G commands for selecting the 3D TRC are evaluated in the approach block, i.e. typically in the block that contains G41 or G42.

G41 or G42 can also be programmed in blocks without traversing movement in geometry axes relevant for the compensation. In this case, the approach block is the first traversing block following such a block.

A change of the 3D TRC variant with active tool radius compensation is ignored without alarm.

Example

Program code	Comment
N10 \$TC_DP1[1,1]=120	; Cylindrical milling tool
N20 \$TC_DP6[1,1]=10	
N30 \$TC_DP15[1,1]=-3	
...	
; Processing with cylindrical milling tool and CUT3DCCD	
N110 TRAORI	; Activation of the transformation.
N120 A4=0 B4=0 C4=1	; Definition of the surface normal of the limitation surface at the start of the block.
N130 X0 Y0 Z0 A0 C0 T1 D1 F20000	
N140 X10 Y0 Z0 G41 CUT3DCCD CDOF2 G64	; Activate 3D circumferential milling, taking into account the limitation surface + switching off collision detection.
N150 X20	
N160 X30 A45	; Obtuse angle ==> no infeed
N170 X40 A-45	; Acute angle ==> infeed
N180 X55	
N190 Y10 Z10	; Movement in the tool direction.
N200 Y20	
N210 C45	; Pure change in orientation.
N220 Y30 C90	
N230 A5=-1 B5=0 C5=2 Y40	; Change of the surface.
N240 Y50 G40	; Deactivation of the tool radius compensation.
...	

Further information

Tool type

The tool type (tool parameter \$TC_DP1) is evaluated. Only milling tools with cylindrical shank (cylinder or end mill, toroidal miller and, in the limit case, cylindrical die mill) are permitted. This corresponds to the tool types 1 - 399, with the exception of the numbers 111 and 155 to 157.

Standard tools with corner rounding

Corner rounding with a standard tool is defined by the tool parameter \$TC_DP7. Tool parameter \$TC_DP16 describes the deviation of the corner rounding of the real tool compared with the standard tool.

Example: Toroidal miller with reduced radius compared to the standard tool

Tool type	Shaft radius (R)	Corner radius (r)
Standard tool with corner rounding	$R = \$TC_DP6$	$r = \$TC_DP7$
Real tool with corner rounding Tool types 121 and 131 toroidal miller (end mill with corner rounding)	$R' = \$TC_DP6 + \$TC_DP15 + OFFN$	$r' = \$TC_DP7 + \TC_DP16

In this example, both $\$TC_DP15 + OFFN$ and $\$TC_DP16$ are negative.

3D TRC with CUT3DCCD: Tool center-point path with infeed up to the limitation surface

If a tool with a smaller radius than the appropriate standard tool is used, machining is continued using a milling tool, which is fed in in the longitudinal direction until it reaches the bottom (base) of the pocket. The tool removes as much material from the corner formed by the machining surface and limitation surface. This involves a machining type combining circumferential and face milling. Analogous to a tool with reduced radius, for a tool with increased radius, the infeed is in the opposite direction.

- ① Standard tool
- ② Tool with smaller radius infeed up to the limitation surface
- ③ Limitation surface
- ④ Machining surface

Contrary to all other tool offsets of G group 22, tool parameter $\$TC_DP6$ specified for CUT3DCCD has no relevance for the tool radius and does not influence the resulting compensation. The compensation offset results from the sum of the wear value of the tool radius (tool parameter $\$TC_DP15$) and a tool offset OFFN programmed to calculate the perpendicular offset to the limitation surface.

The generated part program does not specify whether the surface to be machined is to the right or left of the path. It is therefore assumed that the radius is a positive value and the wear value of the original tool is a negative value. A negative wear value always describes a tool with a reduced diameter.

Using cylindrical tools

When cylindrical tools are used, infeed is only necessary if the machining surface and the surface of limitation form an acute angle (less than 90 degrees). If a toroidal miller (end mill with corner rounding) is used, tool infeed in the longitudinal direction is required for both acute and obtuse angles.

3D TRC with CUT3DCC: Contour on the machining surface

If CUT3DCC is active with a toroidal miller, the programmed path refers to a fictitious cylindrical milling tool having the same diameter. The resulting path reference point is shown in the following diagram for a toroidal miller.

- ① Toroidal miller
- ② Limitation surface
- ③ Path reference point
- ④ Machining surface
- R Shaft radius (tool radius)

The angle between the machining and limitation surfaces may change from an acute to an obtuse angle and vice versa even within the same block.

The tool actually being used may either be larger or smaller than the standard tool. However, the resulting corner radius must not be negative and the sign of the resulting tool radius must be kept.

For CUT3DCC, the NC part program refers to the contour on the machining surface. As for conventional tool radius compensation, the total tool radius is used that comprises the following components:

- Tool radius (tool parameter \$TC_DP6)
- Wear value (tool parameter \$TC_DP15)
- A tool offset OFFN programmed to calculate the perpendicular offset to the limitation surface

The position of the limitation surface is defined from the following difference:

Dimensions of the standard tool - tool radius (tool parameter \$TC_DP6)

Advanced Surface / Top Surface**Note**

When applying tool radius compensation CUT3DCC / CUT3DCCD in combination with the "Advanced Surface" or "Top Surface" function (requiring a license), the setting recommendations regarding "Advanced Surface" / "Top Surface" must be observed.

Special test programs are provided in the SIOS portal for checking the set data:

- Test programs for Advanced Surface (<https://support.industry.siemens.com/cs/ww/en/view/78956392>)
 - Test programs for Top Surface (<https://support.industry.siemens.com/cs/ww/en/view/109738423>)
-

11.6 Tool orientation (ORIC, ORID, OSOF, OSC, OSS, OSSE, ORIS, OSD, OST)

The term tool orientation describes the geometric alignment of the tool in space. The tool orientation on a 5-axis machine tool can be set by means of program commands.

Orientation rounding movements activated with `OSD` and `OST` are formed differently depending on the type of interpolation for tool orientation.

If vector interpolation is active, the smoothed orientation characteristic is also interpolated using vector interpolation. On the other hand, if rotary axis interpolation is active, the orientation is smoothed directly using rotary axis movements.

Programming

Programming a orientation change:

A change in tool orientation can be programmed by:

- Direct programming of rotary axes A, B, C (rotary axis interpolation)
- Euler or RPY angle
- Direction vector (vector interpolation by specifying A3 or B3 or C3)
- LEAD/TILT (face milling)

The reference coordinate system is either the machine coordinate system (`ORIMKS`) or the current workpiece coordinate system (`ORIWKS`).

11.6 Tool orientation (ORIC, ORID, OSOF, OSC, OSS, OSSE, ORIS, OSD, OST)

**Programming tool orientation:**

ORIC:	Orientation and path movement in parallel
ORID:	Orientation and path movement consecutively
OSOF:	No orientation smoothing
OSC:	Orientation constantly
OSS:	Orientation smoothing only at beginning of block
OSSE:	Orientation smoothing at beginning and end of block
ORIS:	Velocity of the orientation change with orientation smoothing activated in degrees per mm (valid for OSS and OSSE)
OSD:	Smoothing of orientation by specifying smoothing distance with setting data: SD42674 \$SC_ORI_SMOOTH_DIST
OST:	Smoothing of orientation by specifying angular tolerance in degrees for vector interpolation with setting data: SD42676 \$SC_ORI_SMOOTH_TOL With rotary axis interpolation, the specified tolerance is assumed to be the maximum variance of the orientation axes.

Note

All commands for smoothing the tool orientation (OSOF, OSC, OSS, OSSE, OSD, and OST) are summarized in G group 34. They are modal; in other words, only one of these commands can ever be effective at the same time.

Examples**Example 1: ORIC**

If two or more blocks with orientation changes are programmed between the traversing blocks N10 and N20 (e.g. A2=... B2=... C2=...) programmed and ORIC is active, then the

inserted circle block is distributed among these intermediate blocks according to the absolute changes in angle.

Program code	Comment
ORIC	
N8 A2=... B2=... C2=...	
N10 X... Y... Z...	
N12 C2=... B2=...	; The circle block inserted at the external corner is distributed between N12 and N14, corresponding to the change in orientation. The circular motion and the orientation change are executed in parallel.
N14 C2=... B2=...	
N20 X =...Y=... Z=... G1 F200	

Example 2: ORID

If **ORID** is active, then all blocks between the two traversing blocks are executed at the end of the first traversing block. The circle block with constant orientation is executed immediately before the second traversing block.

11.6 Tool orientation (ORIC, ORID, OSOF, OSC, OSS, OSSE, ORIS, OSD, OST)

Program code	Comment
ORID	
N8 A2=... B2=... C2=...	
N10 X... Y... Z...	
N12 A2=... B2=... C2=...	; The N12 and N14 blocks are executed at the end of N10. The circle block is then executed with the actual orientation.
N14 M20	; Help functions, etc.
N20 X... Y... Z...	

Note

The method which is used to change orientation at an outer contour is determined using the program command that is active in the first traversing block of an outer corner.

Without change in orientation: If the orientation is not changed at the block boundary, the cross-section of the tool is a circle, which touches both of the contours.

Example 3: Change in orientation at an inside corner**Program code**

```
ORIC  
N10 X ...Y... Z... G1 F500  
N12 X ...Y... Z... A2=... B2=... C2=...  
N15 X ...Y... Z... A2=... B2=... C2=...
```

Further information**Behavior at outer corners**

A circle block with the radius of the cutter is always inserted at an outside corner.

The `ORIC` and `ORID` program commands are used to determine whether changes in orientation programmed between block `N1` and `N2` are executed before the inserted circle block is processed or at the same time.

11.6 Tool orientation (ORIC, ORID, OSOF, OSC, OSS, OSSE, ORIS, OSD, OST)

If an orientation change is required at outside corners, this can be performed either at the same time as interpolation or separately together with the path movement.

When **ORID** is programmed, the inserted blocks are executed first without path motion. The circle block generating the corner is inserted immediately before the second of the two traversing blocks.

If several orientation blocks are inserted at an external corner and **ORIC** is selected, the circular motion is distributed among the individual inserted blocks according to the absolute values of the orientation changes.

Smoothing orientation with OSD or OST

When blending with **G642**, the maximum variance for the contour axes and orientation axes cannot vary greatly. The smaller tolerance of the two determines the type of smoothing motion and/or angular tolerance to smooth the orientation characteristic relatively strongly without having to accept higher contour deviations.

OSD and **OST** can be activated to "generously" smooth very slight deviations from the orientation characteristics with a specified smoothing distance and angular tolerance without serious contour deviations.

Note

Unlike the process of rounding the contour (and orientation characteristics) with **G642**, when rounding the orientation with **OSD** and/or **OST**, a separate block is not formed, instead the rounding movement is added directly to the programmed original blocks.

With **OSD** and/or **OST**, block transitions cannot be rounded if there is a change in the type of interpolation for tool orientation (vector → rotary axis, rotary axis → vector). These block transitions can if necessary be rounded with the standard rounding functions **G641**, **G642** and **G643**.

11.7 Free assignment of D numbers, cutting edge numbers

11.7.1 Free assignment of D numbers, cutting edge numbers (CE address)

D number

The D numbers can be used as contour numbers. You can also address the number of the cutting edge via the address CE. You can use the system variable \$TC_DPCE to describe the cutting edge number.

Default: compensation no. == tool edge no.

Machine data are used to define the maximum number of D numbers (cutting edge numbers) and the maximum number of cutting edges per tool (→ machinery construction OEM). The following commands are only practical if the maximum cutting edge number (MD18105) was specified to be greater than the number of cutting edges per tool (MD18106). See machine manufacturer's specifications.

Note

In addition to relative D number allocation, the D numbers can also be assigned as "flat" or "absolute" D numbers (1-32000) without a reference to a T number (within the "Flat D number structure" function).

References

Function Manual Basic Functions; Tool Offset (W1)

11.7.2 Free assignment of D numbers: Checking D numbers (CHKDNO)

Using the `CKKDNO` command, you can check whether the existing D numbers were uniquely assigned. The D numbers of all tools defined within a TO unit may not occur more than once. No allowance is made for replacement tools.

Syntax

```
state=CHKDNO (Tno1, Tno2, Dno)
```

Meaning

state:	=TRUE:	The D numbers are assigned uniquely to the checked areas.
	=FALSE:	There was a D number collision or the parameters are invalid. Tno1, Tno2 and Dno return the parameters that caused the collision. These data can now be evaluated in the part program.

11.7 Free assignment of D numbers, cutting edge numbers

CHKDNO (Tno1, Tno2):	All D numbers of the part specified are checked.
CHKDNO (Tno1):	All D numbers of Tno1 are checked against all other tools.
CHKDNO:	All D numbers of all tools are checked against all other tools.

11.7.3 Free assignment of D numbers: Rename D numbers (GETDNO, SETDNO)

You must assign unique D numbers. Two different cutting edges of a tool must not have the same D number.

GETDNO

This command returns the D number of a particular cutting edge (ce) of a tool with tool number t. If no D number exists for the entered parameters, d=0 will be set. If the D number is invalid, a value greater than 32000 is returned.

SETDNO

This command assigns the value d of the D number to a cutting edge (ce) of tool t. The result of this statement is returned via state (TRUE or FALSE). If there is no data block for the specified parameter, the value FALSE is returned. Syntax errors generate an alarm. The D number cannot be set explicitly to 0.

Syntax

```
d = GETDNO (t, ce)
state = SETDNO (t, ce, d)
```

Meaning

d:	D number of the tool edge
t:	T number of the tool
ce:	Cutting edge number (CE number) of the tool
state:	Indicates whether the command could be executed (TRUE or FALSE).

Example for renaming a D number

Programming	Comment
\$TC_DP2[1,2]=120	
\$TC_DP3[1,2] = 5.5	
\$TC_DPCE[1,2] = 3	; Cutting edge number CE
...	
N10 def int DNoOld, DNoNew = 17	
N20 DNoOld = GETDNO(1,3)	
N30 SETDNO(1,3,DNoNew)	

11.7 Free assignment of D numbers, cutting edge numbers

The new D value 17 is then assigned to cutting edge CE=3. Now the data for the cutting edge is addressed via D number 17; both via the system variables and in the programming with the NC address.

11.7.4 Free assignment of D numbers: Determine T number to the specified D number (GETACTTD)

You determine the T number associated with an absolute D number using the `GETACTTD` command. There is no check for uniqueness. If several D numbers within a TO unit are the same, the T number of the first tool found in the search is returned. This command is not suitable for use with "flat" D numbers, because the value "1" is always returned in this case (no T numbers in database).

Syntax

```
status=GETACTTD (Tnr, Dnr)
```

Meaning

Dnr:	D number for which the T number shall be searched.	
Tnr:	T number found	
status:	Value:	Meaning:
	0	The T number has been found. Tno contains the value of the T number.
	-1	No T number exists for the specified D number; Tno=0.
	-2	The D number is not absolute. Tno receives the value of the first found tool that contains the D number with the value Dno.
	-5	The function was not able to be executed for another reason.

11.7.5 Free assignment of D numbers: Invalidate D numbers (DZERO)

The `DZERO` command is used for support during retooling. Compensation data sets tagged with this command are no longer verified by the `CHKDNO` command. These data sets can be accessed again by setting the D number once more with `SETDNO`.

Syntax

```
DZERO
```

Meaning

DZERO:	Marks all D numbers of the TO unit as invalid.
--------	--

11.8 Toolholder kinematics

Requirements

A toolholder can only orientate a tool in all possible directions in space if

- Two rotary axes v_1 and v_2 are present.
- The rotary axes are mutually orthogonal.
- The tool longitudinal axis is perpendicular to the second rotary axis v_2 .

In addition, the following requirement is applicable to machines for which all possible orientations have to be settable:

- The tool longitudinal axis must be perpendicular to the first rotary axis v_1 .

Function

The toolholder kinematics with a maximum of two rotary axes v_1 or v_2 are defined using the 17 system variables \$TC_CARR1[m] to \$TC_CARR17[m]. The description of the toolholder consists of:

- The vectoral distance from the first rotary axis of the toolholder I_1 , the vectoral distance from the first rotary axis to the second rotary axis I_2 , the vectoral distance from the second rotary axis to the reference point of the tool I_3 .
- The direction vectors of both rotary axes v_1 , v_2 .
- The angles of rotation α_1 , α_2 around the two axes. The rotation angles are counted in viewing direction of the rotary axis vectors, positive, in clockwise direction of rotation.

For machines with **resolved kinematics** (both the tool and the part can rotate), the system variables have been extended with the entries \$TC_CARR18[m] to \$TC_CARR23[m].

Parameters

Function of the system variables for orientable toolholders			
Designation	x component	y component	z component

Extensions of the system variables for orientable toolholders			
l_2 offset vector	\$TC_CARR44[m]	\$TC_CARR45[m]	\$TC_CARR46[m]
l_3 offset vector	\$TC_CARR55[m]	\$TC_CARR56[m]	\$TC_CARR57[m]
l_4 offset vector	\$TC_CARR58[m]	\$TC_CARR59[m]	\$TC_CARR60[m]
v_1 rotary axis	\$TC_CARR64[m]		
v_2 rotary axis	\$TC_CARR65[m]		

Note**Explanations of parameters**

"m" specifies the number of the toolholder to be programmed.

\$TC_CARR47 to \$TC_CARR54 and \$TC_CARR61 to \$TC_CARR63 are not defined and produce an alarm if read or write access is attempted.

The start/end points of the distance vectors on the axes can be freely selected. The rotation angles α_1 , α_2 around the two axes are defined in the initial state of the toolholder by 0° . In this way, the kinematics of a toolholder can be programmed for any number of possibilities.

Toolholders with only one or no rotary axis at all can be described by setting the direction vectors of one or both rotary axes to zero.

With a toolholder without rotary axis the distance vectors act as additional tool offsets whose components cannot be affected by a change of machining plane (G17 to G19).

Parameter extensions**Parameters of the rotary axes**

The system variables have been extended by the entries \$TC_CARR24[m] to \$TC_CARR33[m] and described as follows:

Offset of rotary axes v_1 , v_2	Changing the position of the rotary axis v_1 or v_2 for the initial setting of the oriented toolholder.
The angle offset/angle increment of the rotary axes v_1 , v_2	The offset or the angle increment of the Hirth tooth system of the rotary axes v_1 and v_2 . Programmed or calculated angle is rounded up to the next value that results from $\phi = s + n \cdot d$ when n is an integer.
The minimum and maximum position of the rotary axes v_1 , v_2	The minimum and maximum position of the rotary axis limit angle (software limit) of the rotary axes v_1 and v_2 .

Parameters for the user

\$TC_CARR34 to \$TC_CARR40 contain parameters that are freely available to users and up to SW 6.4 were as standard, not further evaluated within the NCK or had no significance.

Fine offset parameters

\$TC_CARR41 to \$TC_CARR65 include fine offset parameters that can be added to the values in the basis parameters. The fine offset value assigned to a basic parameter is obtained when the value 40 is added to the parameter number.

Example

The toolholder used in the following example can be fully described by a rotation around the Y axis.

Program code	Comment
N10 \$TC_CARR8[1]=1	; Definition of the Y component of the first rotary axis of toolholder 1.
N20 \$TC_DP1[1,1] = 120	; Definition of a shaft miller.
N30 \$TC_DP3[1,1]=20	; Definition of a shaft miller, 20 mm long.
N40 \$TC_DP6[1,1]=5	; Definition of a shaft miller with 5 mm radius.
N50 ROT Y37	; Frame definition with 37° rotation around the Y axis.
N60 X0 Y0 Z0 F10000	; Approach start position.
N70 G42 CUT2DF TCOFR TCARR=1 T1 D1 X10	Set radius compensation, tool length compensation in rotated frame, select toolholder 1, tool 1.
N80 X40	; Perform machining under a rotation of 37°.
N90 Y40	
N100 X0	
N110 Y0	
N120 M30	

Further information

Resolved kinematics

For machines with resolved kinematics (both the tool as well as the workpiece can be rotated), the system variables have been expanded by the entries `$TC_CARR18 [m]` up to `$TC_CARR23 [m]` and are described as follows:

The rotatable tool table consisting of:

- The vectorial clearance of the second rotary axis V_2 to the reference point of a tool table that can be rotated I_4 of the third rotary axis.

The rotary axes consisting of:

- The two channel identifiers for the reference of the rotary axes V_1 and V_2 , whose position is, when required, accessed to determine the orientation of the toolholder that can be orientated.

The type of kinematics with one of the values T, P or M:

- Kinematics type T: Only tool can rotate.
- Kinematics type P: Only part can rotate.
- Kinematics type M: Tool and part can rotate.

Clearing the toolholder data

Data of all toolholder data sets can be deleted using `$TC_CARR1 [0]=0`.

The kinematic type `$TC_CARR23 [T]=T` must be assigned with one of the three permissible uppercase or lowercase letters (T,P,M) and for this reason, should not be deleted.

Changing the toolholder data

Each of the described values can be modified by assigning a new value in the part program. Any character other than T, P or M results in an alarm when an attempt is made to activate the toolholder that can be orientated.

Reading the toolholder data

Each of the described values can be read by assigning it to a variable in the part program.

Fine offsets

An illegal fine offset value is only detected if a toolholder that can be orientated is activated, which contains such a value and at the same time setting data
SD42974 `$SC_TOCARR_FINE_CORRECTION = TRUE`.

The maximum permissible fine offset is limited to a permissible value in the machine data.

11.9 Tool length compensation for orientable toolholders (TCARR, TCOABS, TCOFR, TCOFRX, TCOFRY, TCOFRZ)

When the spatial orientation of the tool changes, its tool length components also change.

After a reset, e.g. through manual setting or change of the toolholder with a fixed spatial orientation, the tool length components also have to be determined again. This is performed using the TCOABS and TCOFR path commands.

For a toolholder of an active frame that can be orientated, when selecting the tool with TCOFRZ, TCOFRY and TCOFRX, it is possible to define the direction in which the tool should point.

Syntax

```
TCARR= [ <m> ]
TCOABS
TCOFR
TCOFRZ
TCOFRY
TCOFRX
```

Meaning

TCARR= [<m>]:	Request toolholder with the number "m"
TCOABS:	Determine tool length components from the orientation of the current toolholder
TCOFR:	Determine tool length components from the orientation of the active frame
TCOFRZ:	Orientable toolholder from active frame with a tool pointing in the Z direction
TCOFRY:	Orientable toolholder from active frame with a tool pointing in the Y direction
TCOFRX:	Orientable toolholder from active frame with a tool pointing in the X direction

11.9 Tool length compensation for orientable toolholders (TCARR, TCOABS, TCOFR, TCOFRX, TCOFRY, TCOFRZ)

Further information

Determine tool length offset from the orientation of the toolholder (TCOABS)

TCOABS calculates the tool length offset from the current orientation angles of the toolholder; saved in the system variables \$TC_CARR13 and \$TC_CARR14.

For a definition of toolholder kinematics with system variables, see "Toolholder kinematics (Page 447)".

In order to make a new calculation of the tool length offset when frames are changed, the tool has to be selected again.

Tool direction from active frame

The toolholder with orientation capability is set so that the tool points in the following directions:

- With TCOFR or TCOFRZ in the Z direction
- With TCOFRY in the Y direction
- With TCOFRX in the X direction

The tool length offset is re-calculated when changing over between TCOFR and TCOABS.

Request toolholder (TCARR)

With TCARR, the toolholder number m is requested with its geometry data (compensation memory).

With m=0, the active toolholder is deselected.

The geometry data of the toolholder only becomes active after a tool is called. The selected tool remains active after a toolholder change has taken place.

The current geometry data for the toolholder can also be defined in the part program via the corresponding system variables.

Recalculation of tool length offset (TCOABS) for a frame change

In order to make a new calculation of the tool length offset when frames are changed, the tool has to be selected again.

Note

The tool orientation must be manually adapted to the active frame.

When the tool length offset is calculated, the angle of rotation of the toolholder is calculated in an intermediate step. With toolholders with two rotary axes, there are generally two sets of rotation angles, which can be used to adapt the tool orientation to the active frame; therefore,

11.9 Tool length compensation for orientable toolholders (TCARR, TCOABS, TCOFR, TCOFRX, TCOFRY, TCOFRZ)

the rotation angle values stored in the system variables must at least correspond approximately to the mechanically set rotation angles.

Note

Tool orientation

It is not possible for the control to check whether the rotation angles calculated by means of the frame orientation are settable on the machine.

If the rotary axes of the toolholder are arranged such that the tool orientation calculated by means of the frame orientation cannot be reached, then an alarm is output.

The combination of tool precision compensation and the functions for tool length offset on movable toolholders is not permissible. If both functions are called simultaneously, an error message is issued.

The TOFRAME function allows a frame to be defined on the basis of the direction of orientation of the selected toolholder. For more information please refer to chapter "Frames".

When orientation transformation is active (3, 4 or 5-axis transformation), it is possible to select a toolholder with an orientation deviating from the zero position without causing output of an alarm.

Transfer parameter from standard and measuring cycles

For the transfer parameter of standard and measuring cycles, the following defined value ranges apply.

For angular value, the value range is defined as follows:

- Rotation around 1st geometry axis: -180 degrees to +180 degrees
- Rotation around 2nd geometry axis: -90 degrees to +90 degrees
- Rotation around 3rd geometry axis: -180 degrees to +180 degrees

Refer to Chapter Frames, "Programmable rotation (ROT, AROT, RPL)".

Note

When transferring angular values to a standard or measuring cycle, the following should be carefully observed:

Values less than the calculation resolution of the NC should be rounded-off to zero!

The calculation resolution of the NC for angular positions is defined in the machine data:

MD10210 \$MN_INT_INCR_PER_DEG

11.10 Online tool length compensation (TOFFON, TOFFOF)

Use the system variable \$AA_TOFF[<n>] to overlay the effective tool lengths in accordance with the three tool directions three-dimensionally in real time.

The three geometry axis identifiers are used as index <n>. Thus, the number of active direction offsets is determined by the geometry axes that are active at the same time.

All offsets can be active at the same time.

The online tool length offset function can be used for:

- Orientation transformation TRAORI
- Orientable toolholder TCARR

Note

Online tool length offset is an **option**, which must be enabled in advance. This function is only practical in conjunction with an active orientation transformation or an active orientable toolholder.

Syntax

```
TRAORI
TOFFON(<compensation direction>[,<offset value>])
WHEN TRUE DO $AA_TOFF[<compensation direction>]           ; In synchronized actions.
...
TOFFOF(<compensation direction>)
```

For more information about programming online tool length offset in motion-synchronous actions, see "Synchronized actions (Page 603)".

Meaning

TOFFON:	Activate online tool length offset	
	<compensation direction>:	Tool direction (X, Y, Z), in which the online tool length offset should be active.
	<offset value>:	When activating, an offset value can be specified for the relevant direction of compensation and this is immediately recovered.
TOFFOF:	Reset online tool length offset The compensation values in the specified compensation direction are reset and a pre-processing stop is initiated.	

Examples

Example 1: Selecting the tool length compensation

Program code	Comment
MD21190 \$MC_TOFF_MODE = 1	; Absolute values are approached.
MD21194 \$MC_TOFF_VELO[0] =1000	
MD21196 \$MC_TOFF_VELO[1] =1000	
MD21194 \$MC_TOFF_VELO[2] =1000	
MD21196 \$MC_TOFF_ACCEL[0] =1	
MD21196 \$MC_TOFF_ACCEL[1] =1	
MD21196 \$MC_TOFF_ACCEL[2] =1	
N5 DEF REAL XOFFSET	
N10 TRAORI (1)	; Transformation on.
N20 TOFFON (Z)	; Activation of online tool length compensation for the Z tool direction.
N30 WHEN TRUE DO \$AA_TOFF[Z]=10 G4 F5	; A TLC of 10 is interpolated for the Z tool direction.
...	
N100 XOFFSET=\$AA_TOFF_VAL[X]	; Assigns actual compensation in the X direction.
N120 TOFFON(X,-XOFFSET) G4 F5	; For the X tool direction, the TLC is reduced back to 0.

Example 2: Deselect the tool length offset

Program code	Comment
N10 TRAORI (1)	; Transformation on.
N20 TOFFON (X)	; Activation of online tool length compensation for the X tool direction.
N30 WHEN TRUE DO \$AA_TOFF[X]=10 G4 F5	; A TLC of 10 is interpolated for the X tool direction.
...	
N80 TOFFOF (X)	; Position offset of the X tool direction is deleted: ...\$AA_TOFF[X]=0 No axis is moved. The position offset is added to the actual position in the Work corresponding to the actual orientation.

Further information

Block preparation

During block preparation in preprocessing, the current tool length offset active in the main run is also taken into consideration. To allow extensive use to be made of the maximum permissible axis velocity, it is necessary to stop block preparation with a `STOPRE` preprocessing stop while a tool offset is established.

The tool offset is always known at the time of run-in when the tool length offsets are not changed after program start or if more blocks have been processed after changing the tool length offsets than the IPO buffer can accommodate between run-in and main run.

Variable \$AA_TOFF_PREP_DIFF

The dimension for the difference between the currently active compensation in the interpolator and the compensation that was active at the time of block preparation can be polled in the variable `$AA_TOFF_PREP_DIFF[<n>]`.

Adjusting machine data and setting data

The following system data is available for online tool length offset:

- MD20610 \$MC_ADD_MOVE_ACCEL_RESERVE (acceleration margin for overlaid motion)
- MD21190 \$MC_TOFF_MODE
Content of system variable `$AA_TOFF[<n>]` is moved through as absolute value or is integrated up.
- MD21194 \$MC_TOFF_VELO (velocity of the online tool length offset)
- MD21196 \$MC_TOFF_ACCEL (acceleration of the online tool length offset)
- Setting data for presetting limit values
:
SD42970 \$SC_TOFF_LIMIT (upper limit of the tool length offset value)

Function Manual, Special Functions; F2: Multi-axis transformations

11.11 Modification of the offset data for rotatable tools

11.11.1 Calculating orientations (ORISOLH)

The predefined ORISOLH function helps the user to set the rotary axis positions of a machine so that a turning tool can be brought into a defined, kinematic-independent position relative to the workpiece. Prerequisite is that a 6-axis transformation is active that has been parameterized with kinematic chains.

Two basic functions are available:

- Tool alignment
The β and γ angles are specified. The function calculates the angles of the three orientation axes required for this.
- Direct tool alignment
The angles of the second and third orientation axes are specified. The function calculates the associated β and γ angles as well as that of the missing first orientation axis.

Note

Order of the orientation axes

If you run through the kinematic chain that describes the structure of the machine, from the workpiece to the tool, then the following specifications apply for the order of the three orientation axes of a 6-axis transformation:

- The orientation axis that is closest to the **workpiece** is the **first** orientation axis.
- The orientation axis that is closest to the **tool** is the **third** orientation axis.

Generally, the first orientation axis is a spindle and the corresponding rotation is therefore implemented in these cases through a rotating frame.

Syntax

```
<RetVal> = ORISOLH(<Cntrl>,<W1>,<W2>)
```

Meaning

ORISOLH:	Function call	
<RetVal>:	Function return value	
	Data type:	INT
	Range of values:	0, -2, -3, ..., -17
	Values:	0 Function has ended without an error.
		-2 No valid transformation (6-axis orientation transformation) is active.
		-3 The first parameter (<Cntrl>) is negative.
		-4 The unit position of the first parameter (<Cntrl>) is invalid. Only the values 0 and 1 are permissible.
		-5 The tens position of the first parameter (<Cntrl>) is invalid. Only the values 0 to 3 are permissible.
		-6 The hundreds position of the first parameter (<Cntrl>) is invalid. Only the values 0 and 1 are permissible.
		-7 The thousands position of the first parameter (<Cntrl>) is invalid. Only the values 0 to 3 are permissible.
		-8 Angle γ is too large for the "Direct tool alignment" function.
		-9 At least one of the specified axis positions violates an axis limit for the "Direct tool alignment" function.
		-10 No tool is active.
		-11 The requested orientation cannot be set.
		-12 The adaptation of the free axis angle for the Hirth joint is not possible for the first or only solution.
		-13 The adaptation of the free axis angle for the Hirth joint is not possible for the second solution.
		-14 The adaptation of the free axis angle for the Hirth joint is not possible for either of the two solutions.
		-15 The first orientation axis is parameterized as Hirth axis.
		-16 The second as well as the third rotary axis has been parameterized as Hirth axis. Only one of the two axes can be the Hirth axis.
		-17 At least one of the specified axis positions is not compatible with the associated Hirth joint for the "Swivel directly" function.

11.11 Modification of the offset data for rotatable tools

<Cntrl>:	Controls the behavior of the function	
	Data type:	INT
	The <Cntrl> parameter is decimal coded (unit to thousands position):	
	Unit position:	The unit position controls the response to errors.
	xxx0	In the event of an error (return value < 0), alarm 14106 is output and program processing is aborted. Note: The alarm is also output irrespective of the value of the unit position when the <Cntrl> parameter is negative.
	xxx1	In the event of an error (return value < 0) no alarm is output. The user can react suitably in the program.
	Tens position:	Controls the behavior when an orientation axis with Hirth joint is present. Note: This parameter is only evaluated for the "Tool alignment" function (i.e. when the hundreds position has the value "0").
	xx0x	The axis position is rounded off to the nearest position.
	xx1x	The axis positions are rounded off so that the difference of the β angle to its programmed value is minimal.
	xx2x	The axis positions are rounded off so that the β angle is equal to the highest possible value which is less than the programmed value (β is rounded down).
	xx3x	The axis positions are rounded off so that the β angle is equal to the lowest possible value which is greater than the programmed value (β is rounded up).
	Hundreds position:	Specifies which function is to be executed or the significance of the two following parameters <W1> and <W2>.
	x0xx	"Tool alignment" function Parameters <W1> and <W2> have the following meaning: <ul style="list-style-type: none"> • <W1> = β • <W2> = γ The associated angles of the orientation axes are calculated.
	x1xx	"Direct tool alignment" function <W1> is the position specification for the second orientation axis, <W2> is the position specification for the third orientation axis of a 6-axis transformation. The position of the first orientation axis and the β and γ angles are defined which are compatible with the two position specifications. If no error occurs, two solutions are always output in the \$P_ORI_POS[<n>, <m>] system variables. The first index <n> (0 or 1) refers to the solution and the second index <m> (0 ... 2) to the orientation axis: <ul style="list-style-type: none"> • \$P_ORI_POS[0/1, 0]: Position of the first orientation axis • \$P_ORI_POS[0/1, 1]: Angle β • \$P_ORI_POS[0/1, 2]: Angle γ A check is made as to whether the position specifications <W1> and <W2> are compatible with any Hirth joints or active software limits. If this is not the case, a corresponding error number is returned (see <RetVal> parameter).

11.11 Modification of the offset data for rotatable tools

			If the angles <W1> and <W2> are selected arbitrarily, the cutting edge of the tool is generally not in the machining plane. The angle γ through which the cutting edge is rotated out of the machining plane, must not be greater than the limit value which is defined by the setting data SD42999 \$SC_OR-ISOLH_INCLINE_TOL.
	Thousands position:		Specifies which positions of the solutions may be modified when the hundreds position has the value "0", i.e. for the "Tool alignment" function.
		0xxx	The calculated axis positions should be as close as possible to the current machine axis positions.
		1xxx	The calculated axis positions for modulo axes should be as close as possible to the middle of the modulo range, for other axes as close as possible to 0. For non-modulo axes, this means that the axis positions are reduced to the range $-180^\circ \dots +180^\circ$.
		2xxx	The calculated axis positions should be reduced to the range $-180^\circ \dots +180^\circ$ irrespective of the axis type.
<W1>:	First angle The meaning results from the hundreds position of the <Cntrl> paramter.		
	Data type:	REAL	
<W1>:	Second angle The meaning results from the hundreds position of the <Cntrl> paramter.		
	Data type:	REAL	

Note

Parameters that have not been programmed have the default value "0".

Further information

The number of solutions found together with further status information when executing the ORISOLH function, can be read via the following system variables:

System variable	Meaning	
\$P_ORI_POS [<n>, <m>]	Returns the angles of the orientation axes that result from the orientation programming.	
	<n>:	Index of the solution
	Range of values:	0, 1
	<m>:	Index of the orientation axis
	Range of values:	0 ... 2 The order of the orientation axes (1 ... 3) refers to the definition of the axes in \$NT_ROT_AX_NAME.
<p>When the ORISOLH function is called in the "Direct tool alignment" mode, the \$P_ORI_POS[0/1, 1] and P_ORI_POS[0/1, 2] variables contain the values of the two angles β and γ belonging to the two solutions.</p> <p>The first solution entered in \$P_ORI_POS[<n>, <m>], i.e. with the index <n> = 0, is always the solution that is selected by the control when the requested orientation is approached directly. The second index <m> refers to the orientation axis, i.e. on \$NT_ROT_AX_NAME.</p> <p>The axis positions entered in \$P_ORI_POS[<n>, <m>] take into account the offsets entered in \$NK_OFF and \$NK_OFF_FINE, i.e. these axis angles can be used in the following blocks to set the required orientation without any further modification.</p> <p>If a rotary axis is a Hirth axis, the solution positions are rounded off to the nearest position of rest of the Hirth joint. For Hirth jointed rotary axes, you can read the differences between the axis positions for the exact solutions and those of the solutions adapted to the Hirth incrementing in the \$P_ORI_DIFF system variable.</p>		
\$P_ORI_DIFF [<n>, <m>]	Returns the difference between the exact positions of the orientation axes and those provided in \$P_ORI_POS that result from the orientation programming.	
	<n>:	Index of the solution
	Range of values:	0, 1
	<m>:	Index of the orientation axis
	Range of values:	0 ... 2 The order of the orientation axes (1 ... 3) refers to the definition of the axes in \$NT_ROT_AX_NAME.
<p>The content can only be not equal to zero when the positions are incremented (Hirth joint), i.e. when the system data \$NT_HIRTH_INCR of the relevant axis is not equal to zero and when this axis is a manual rotary axis.</p>		

11.11 Modification of the offset data for rotatable tools

System variable	Meaning		
\$P_ORI_SOL	If for an orientation transformation with more than one orientation axis, the axis angles are calculated that should result in a specified orientation, there is generally more than one solution. The \$P_ORI_SOL system variables contain the number of valid solutions together with additional status information. The content of \$P_ORI_SOL is coded as follows:		
	Values < 0	General error states	
		-1	No solutions have been calculated yet for the active transformation (missing call of ORISOLH).
		-2	A transformation is not active, or the active transformation is not an orientation transformation (6-axis transformation) that can provide positions for a specified orientation programming.
		-4	The desired orientation cannot be set with the present kinematics.
		-5	No solution was found when the ORISOLH function was called in the "Direct tool alignment" mode.
		-6	Angle γ is too large when the ORISOLH function was called in the "Direct tool alignment" mode.
		-7	An angle was specified when the ORISOLH function was called in the "Direct tool alignment" mode that cannot be set because of the Hirth joint.
		-8	The first orientation axis (frame axis) must not be parameterized as Hirth axis.
		-9	The second as well as the third rotary axis has been parameterized as Hirth axis. Only one of the two axes can be the Hirth axis.
		-10	No adaptation of the solution(s) to the Hirth joint has been found.
	Values > 0	Number of mathematically possible solutions without consideration of axis limits and any error conditions.	
	Unit position	0	There is no solution, i.e. the requested orientation cannot be set. There can be three different causes for this case: <ul style="list-style-type: none">• In principle, the requested orientation cannot be achieved because of the machine kinematics (orientation axes not arranged at right angles) even with an arbitrary traversing range of the orientation axes. In this case, the tens and hundreds positions of \$P_ORI_SOL are both zero, the \$P_ORI_STAT status variables assigned to the orientation axis have the value "-4".• The calculated solutions cannot be achieved because they would violate the axis limits. The positions of the orientation axes that would result without the axis limits, can be read in \$P_ORI_POS.• Axis positions were specified when the ORISOLH function was called in the "Direct tool alignment" mode which would result in either the orientation vector or the orientation normal vector of the tool being aligned parallel to the first orientation axis, whose position is to be calculated. The position of this axis is not defined in these cases.

11.11 Modification of the offset data for rotatable tools

System variable	Meaning	
		1 There is a solution. There can be three different causes for this case: <ul style="list-style-type: none"> Based on the specified orientation and the machine kinematics, there is only one solution (from the mathematical point of view, two coinciding solutions) even without consideration of the axis limits. This case occurs at the edge of the orientation range for kinematics that are not at right angles. \$P_ORI_POS contains both (identical) solutions. There is only one solution because a second solution is invalid due to the violated axis limits. The valid solution is always the first solution in \$P_ORI_POS. The second solution which would result when the axis limits are not taken into account, can also be read in \$P_ORI_POS. This is the normal case when the ORISOLH function is called in the "Direct tool alignment" mode. For the specified axis positions of two orientation axes, there is generally only one valid position for the missing orientation axis to be calculated.
		2 There are two solutions.
		8 There are an infinite number of solutions, i.e. the position of an orientation axis (the polar axis) is arbitrary. However, from the two possible positions of the other axes, one is excluded because of the violated axis limits.
		9 There are an infinite number of solutions, i.e. the position of an orientation axis (the polar axis) is indefinite. The indefinite axis can be determined from the hundreds position or from the \$P_ORI_STAT system variable.
	Values > 0 Tens position	Bit-coded display for violated axis limits. The precise cause of the error can be determined from the \$P_ORI_STAT system variable.
		Bit 0 (value 10): For at least one solution, at least one axis limit of the first orientation axis is violated.
		Bit 1 (value 20): For at least one solution, at least one axis limit of the second orientation axis is violated.
		Bit 2 (value 40): For at least one solution, at least one axis limit of the third orientation axis is violated.
	Values > 0 Hundreds position	Bit-coded display for non-defined axis positions (can only occur when there is an infinite number of solutions, i.e. when the unit position is equal to "9").
		Bit 0 (value 100): The position of the first orientation axis is not defined.
		Bit 1 (value 200): The position of the second orientation axis is not defined.
		Bit 2 (value 400): The position of the third orientation axis is not defined.
	The designations first, second and third orientation axis refer to the definition of the axes in \$NT_ROT_AX_NAME.	

11.11 Modification of the offset data for rotatable tools

System variable	Meaning	
\$P_ORI_STAT [<n>]	Returns the status for each of the maximum three orientation axes after ORISOLH has been called.	
	<n>:	Index of the orientation axis (corresponds to the index of the relevant orientation axis in \$NT_ROT_AX_NAME)
		Range of values: 0 ... 2
		The order of the orientation axes (1 ... 3) refers to the definition of the axes in \$NT_ROT_AX_NAME.
	The content of \$P_ORI_STAT is coded as follows:	
	Values < 0	General error states
	-1	The status is not defined (missing call of ORISOLH).
	-2	A transformation is not active, or the active transformation is not an orientation transformation (6-axis transformation) that can provide positions for a specified orientation programming.
	-3	The axis is not included in the active transformation.
	-4	The position of the axis cannot be calculated because the requested orientation cannot be achieved with the present kinematics even with an arbitrary assumed traversing range of the axis.
	-5	Axis positions were specified when the ORISOLH function was called in the "Direct tool alignment" mode which would result in either the orientation vector or the orientation normal vector of the tool being aligned parallel to the first orientation axis, whose position is to be calculated. The position of this axis is not defined in these cases.
	-6	Angle γ is too large when the ORISOLH function was called in the "Direct tool alignment" mode.
	-7	An angle was specified when the ORISOLH function was called in the "Direct tool alignment" mode that cannot be set because of the Hirth joint.
	-8	The first orientation axis (frame axis) must not be parameterized as Hirth axis.
	-9	The second as well as the third rotary axis has been parameterized as Hirth axis. Only one of the two axes can be the Hirth axis.
	-10	No adaptation of the solution(s) to the Hirth joint has been found.
	Values > 0	Bit-coded display for violated axis limits of the first solution.
	Unit position	Bit 0 (value 1): The first solution violates the lower axis limit.
		Bit 1 (value 2): The first solution violates the upper axis limit.
	Values > 0	Bit-coded display for violated axis limits of the second solution.
	Tens position	Bit 0 (value 10): The second solution violates the lower axis limit.
		Bit 1 (value 20): The second solution violates the upper axis limit.
	Values > 0	Display of a non-defined axis position.
	Hundreds position	Bit 0 (value 100): The position of the orientation axis is not defined, i.e. the requested orientation is achieved with each arbitrary setting of the rotary axis (polar po-

System variable	Meaning
	<p>sition). This information is also contained in the \$P_ORI_SOL system variable.</p> <p>Of the error numbers that indicate a violation of the axis limits, several can occur simultaneously. When an axis limit is violated, an attempt is made to reach a position within the permissible axis limits by adding or subtracting multiples of 360°. If this is not possible, it is not clearly defined whether the lower or the upper axis limit has been violated.</p> <p>If there is no solution for the requested orientation (\$P_ORI_SOL = 0), the status of the orientation axes in the transformation is "0".</p>

Note**\$NT_ROT_AX_NAME**

This system variable refers to a maximum of three axes used for setting the orientation. It contains the names of the chain elements (\$NK_NAME) that define the machine axes (rotary axes) that must perform the orientation movements resulting from a kinematic transformation. The order in which the maximum three rotary axes are contained in this system variable is irrelevant for the machine kinematics because this is derived from the structure of the kinematic chains. However, as it defines the order in which other variables access the rotary axes, the order of the orientation axes in \$NT_ROT_AX_NAME must match the kinematic description.

Note**Status information**

The status information that shows, for example, that an orientation cannot be achieved or can only be achieved when relevant axis limits are violated, does not trigger an NC alarm. It is the responsibility of the user to react suitably to the specified conditions.

11.11.2 Activating the modification of the offset data for rotatable tools (CUTMOD, CUTMODK)

The modification of the offset data for rotatable tools is activated in the NC program via the CUTMOD (in combination with orientable tool carriers) or CUTMODK language command (for orientation transformations that were defined by means of kinematic chains).

Note

As the orientable tool carriers and orientation transformations that were defined by means of kinematic chains cannot be active at the same time, there are no conflicts between the two variants.

Syntax

CUTMOD = <Value>

or

11.11 Modification of the offset data for rotatable tools

CUTMODK = <Command>

Meaning

CUTMOD:	Function call in combination with orientable tool carriers		
<Value>:	Assigned value		
	Data type:	INT	
	Value:	0	<p>The function is deactivated.</p> <p>The values supplied from system variables \$P_AD... are the same as the corresponding tool parameters.</p>
		> 0	<p>The function is activated if an orientable tool carrier with the specified number is active, i.e. the activation is linked to a specific orientable tool carrier.</p> <p>The values supplied from system variables \$P_AD... may be modified with respect to the corresponding tool parameters depending on the active rotation.</p> <p>The deactivation of the designated orientable tool carrier temporarily deactivates the function; the activation of another orientable tool carrier permanently deactivates it. This is the reason why in the first case, the function is re-activated when again selecting the same orientable tool carrier; in the second case, a new selection is required - even if at a subsequent time, the orientable tool carrier is re-activated with the specified number.</p> <p>The function is not influenced by a reset.</p>
		-1	<p>The function is always activated if an orientable tool carrier is active.</p> <p>When changing the tool carrier or when de-selecting it and a subsequent new selection, CUTMOD does not have to be set again.</p>
		-2	<p>The function is always activated if an orientable tool carrier is active whose number is the same as the currently active orientable tool carrier.</p> <p>If an orientable tool carrier is not active, then this has the same significance as CUTMOD=0.</p> <p>If an orientable tool carrier is active, then this has the same significance as when directly specifying the actual tool carrier number.</p>
		< -2	<p>Values less than 2 are ignored, i.e. this case is treated as if CUTMOD was not programmed.</p> <p>Note: This value range should not be used as it is reserved for possible subsequent expansions.</p>
CUTMODK:	Function call in combination with orientation transformations that have been defined by means of kinematic chains		

11.11 Modification of the offset data for rotatable tools

<Command>:	Assigned Command		
	Data type:	STRING	
	Value:	"NEW"	The states of an active transformation defined with kinematic chains relevant for the "Modification of the offset data", the name of the transformation and the current contour frame are saved. Note: This command is only permissible when a suitable transformation (TRAORI_DYN, TRAORI_STAT or TRAANG_K) is active.
		"OFF"	Switches the active "Modification of the offset data" off. The data previously stored with "NEW" is retained. Note: This command is also permissible when CUTMODK is not active. It then remains without effect. Any data set present for the "Modification of the offset data" is retained.
		"ON"	With this command, the "Modification of the offset data" is re-activated with a data set previously stored with the "NEW" command. If a transformation with the name of the stored data set is active when this command is executed, the "Modification of the offset data" takes effect immediately. Otherwise, the activation is delayed until an active transformation is activated.
		"CLEAR"	As with the "OFF" command, switches the "Modification of the offset data" off and also deletes the stored data set. Note: This command is also permissible when CUTMODK is not active.

Note**SD42984 \$SC_CUTDIRMOD**

The CUTMOD or CUTMODK command replaces the function that can be activated using the setting data SD42984 \$SC_CUTDIRMOD. However, this function remains available unchanged. However, as it doesn't make sense to use both functions in parallel, it can only be activated if CUTMOD is equal to zero and CUTMODK is the zero string.

Further information**Reading modified offset data**

The modified offset data is provided in the following system variables and OPI variables:

Meaning	System variable	OPI variable
Cutting edge position	\$P_AD[2]	cuttEdgeParam2
Holder angle	\$P_AD[10]	cuttEdgeParam10
Cut direction	\$P_AD[11]	cuttEdgeParam11
Clearance angle	\$P_AD[24]	cuttEdgeParam24

11.11 Modification of the offset data for rotatable tools

The data is always modified with respect to the corresponding tool parameters (\$TC_DP2[... , ...] etc.) when the "Modification of the offset data for rotatable tools" function was activated with the `CUTMOD` or `CUTMODK` command and the tool was rotated by an orientable tool carrier or a suitable orientation transformation.

Further function-relevant system variables

System variable	Meaning
\$P_CUTMOD_ANG / \$AC_CUTMOD_ANG	Returns the angle through which a tool was rotated in the active machining plane and the modified cutting edge data available for the <code>CUTMOD</code> and <code>CUTMODK</code> functions.
\$P_CUTMOD / \$AC_CUTMOD	Reads the currently valid value that was last programmed with the <code>CUTMOD</code> command (number of the tool carrier for which the modification of the offset data should be activated). If the last programmed value was <code>CUTMOD = -2</code> (activation with the currently active orientable tool carrier), then the value "-2" is not returned in the system variable, but rather the number of the orientable tool carrier active at the time of programming.
\$P_CUTMODK / \$AC_CUTMODK	Reads the name of the transformation under which the currently valid data set for the "Modification of the offset data" was created.
\$P_CUT_INV / \$AC_CUT_INV	Supplies the value <code>TRUE</code> if the tool is rotated so that the spindle direction of rotation must be inverted. To do this, the following four conditions must be fulfilled in the block to which the read operations refer: <ol style="list-style-type: none"> 1. If a turning or grinding tool is active (tool types 400 to 599 and / or SD42950 <code>\$SC_TOOL_LENGTH_TYPE = 2</code>). 2. The modification of the offset data was activated with the <code>CUTMOD</code> or <code>CUTMODK</code> command. 3. An orientable tool carrier or an orientation transformation defined with kinematic chains is active, which was selected with the <code>CUTMOD</code> or <code>CUTMODK</code> command. 4. The tool is rotated by the orientable tool carrier or the kinematic orientation transformation so that the resulting normal of the tool cutting edge is rotated with respect to the initial position by more than 90° (typically 180°). <p>If at least one of the specified four conditions is not fulfilled, the variable returns the value <code>FALSE</code>. For tools whose cutting edge position is not defined, the value of the variable is always <code>FALSE</code>.</p>

System variable	Meaning
\$P_CUTMOD_ERR	Error state after the last call of the CUTMOD function The CUTMOD function can also be called implicitly for a tool change. At a reset, the variable is reset to zero. It is reset at every tool change and, if required, rewritten. The variable is bit-coded. The bits have the following meanings:
	Bit 0: No valid cut direction is defined for the active tool.
	Bit 1: The cutting edge angle (clearance angle and holder angle) of the active tool are both zero.
	Bit 2: The clearance angle of the active tool has an impermissible value ($< 0^\circ$ or $> 180^\circ$).
	Bit 3: The holder angle of the active tool has an impermissible value ($< 0^\circ$ or $> 90^\circ$).
	Bit 4: The plate angle of the active tool has an impermissible value ($< 0^\circ$ or $> 90^\circ$).
	Bit 5: The cutting edge position - holder angle combination of the active tool is not permitted (the holder angle must be $\leq 90^\circ$ for cutting edge position 1 to 4; for cutting edge positions 5 to 8 it must be $\geq 90^\circ$).
	Bit 6: Illegal rotation of the active tool. The tool was rotated out of the active machining plane by $\pm 90^\circ$ (with a tolerance of about 1°). The cutting edge position is therefore no longer defined in the machining plane.
	Bit 7: The cutting plate is not in the machining plane and the angle between the cutting plate and the machining plane exceeds the upper limit specified with the setting data SD42998 \$SC_CUT-MOD_PLANE_TOL.
	Bit 8: The cutting plate is not in the machining plane. Angle α is greater than 1° . Angle α is the angle of rotation around the coordinate axis which is perpendicular to the axis of rotation of angle β as well as to the axis of rotation of angle γ (the X axis for G18).

\$P_...: Preprocessing variables

\$AC_...: Main run variables

All main run variables can be read in synchronized actions. A read access operation from the preprocessing generates a preprocessing stop.

Plane change

To determine the modified cutting edge position, cutting direction and holder or clearance angle, the evaluation of the cutting edge in the active plane (G17 - G19) is decisive.

However, if setting data SD42940 \$SC_TOOL_LENGTH_CONST (change of the tool length component when selecting the plane) has a valid non-zero value (plus or minus 17, 18 or 19), its contents define the plane in which the relevant quantities are evaluated.

This priority rule of the setting data over the G code can be deactivated by setting bit 18 of the machine data \$MC_TOOL_PARAMETER_DEF_MASK. This means that when this bit is set, the plane defined with the G command of group 6 is still valid.

Effectiveness of the modified cutting data

The modified cutting edge position and the modified cutting edge reference point are immediately effective when programming, even for a tool that is already active. A tool does not have to be re-selected for this purpose.

S: Cutting edge center point

P: Cutting edge reference point

SL: Cutting edge position

N310 M30			

The numerical values in the comments specify the end of block positions in the machine coordinates (MCS) in the sequence $X \rightarrow Y \rightarrow Z$.

Explanations

In block N180, initially the tool is selected for CUTMOD=0 and non-rotated tool holders that can be orientated. As all offset vectors of the tool holder that can be orientated are 0, the position that corresponds to the tool lengths specified in \$TC_DP3[1,1] and \$TC_DP4[1,1] is approached.

The tool holder that can be orientated with a rotation of 30° around the B axis is activated in block N200. As the cutting edge position is not modified due to CUTMOD=0, the old cutting edge reference point is decisive just as before. This is the reason why in block N210 the position is approached, which keeps the old tool nose reference point at the zero (i.e. the vector (1, 12) is rotated through 30° in the Z/X plane).

In block N260, contrary to block N200, CUTMOD=2 is effective. As a result of the tool holder rotation that can be orientated, the modified cutting edge position becomes 8. Deviating axis positions also result from this.

The tool radius compensation (TRC) is activated in blocks N220 and/or N270. The different cutting edge position in both program sections has no effect on the end positions of the blocks in which the TRC is active; the corresponding positions are therefore identical. The different cutting edge positions only become effective again in the deselect blocks N260 and/or N300.

11.12 Working with tool environments

Overview of functions

- Save tool environment (TOOLENV) (Page 473)
- Delete tool environment (DELTOOLENV) (Page 476)
- Read T, D and DL number (GETTENV) (Page 477)
- Read tool lengths and/or tool length components (GETTCOR) (Page 478)
- Change tool components (SETTCOR) (Page 484)

System variables overview

- Read information about the saved tool environments (\$P_TOOLENVN, (\$P_TOOLENV) (Page 478)

11.12.1 Save tool environment (TOOLENV)

The TOOLENV function is used to save any current states needed for the evaluation of tool data stored in the memory.

The individual data are as follows:

- The active G command of group:
 - 6 (G17, G18, G19)
 - 56 (TOWSTD, TOWMCS, TOWWCS, TOWBCS, TOWTCS, TOWKCS)
- The active transverse axis
- Machine data:
 - MD18112 \$MN_MM_KIND_OF_SUMCORR (properties of the summed offsets in the TO area)
 - MD20360 \$MC_TOOL_PARAMETER_DEF_MASK (definition of tool parameters).

- Setting data:
 - SD42900 \$SC_MIRROR_TOOL_LENGTH (sign change tool length when mirroring)
 - SD42910 \$SC_MIRROR_TOOL_WEAR (sign change tool wear when mirroring)
 - SD42920 \$SC_WEAR_SIGN_CUTPOS (sign of the tool wear with cutting edge systems)
 - SD42930 \$SC_WEAR_SIGN (sign of wear)
 - SD42935 \$SC_WEAR_TRANSFORM (transformations for tool components)
 - SD42940 \$SC_LENGTH_CONST (change of the tool length components for a plane change)
 - SD42942 \$SC_TOOL_LENGTH_CONST_T (change of tool length components for turning tools at change of plane)
 - SD42950 \$SC_TOOL_LENGTH_TYPE (allocation of the tool length components independent of tool type)
 - SD42954 \$SC_TOOL_ORI_CONST_M (change of tool orientation components for milling tools at change of plane)
 - SD42956 \$SC_TOOL_ORI_CONST_T (change of tool orientation components for turning tools at change of plane)
- The orientation component of the current complete frame (rotation and mirroring, no work offsets or scaling)
- The orientation component and the resulting length of the active toolholder with orientation capability
- The orientation component and the resulting length of an active transformation

In addition to the data describing the environment of the tool, the T number, D number and DL number of the active tool are also stored, so that the tool can be accessed later in the same environment as the TOOLENV call, without having to name the tool again.

Syntax

```
<Status> = TOOLENV(<name>)
```

Meaning

TOOLENV(...):	Predefined function to save a tool environment	
	Alone in the block:	Yes

<Status>:		Function return value. Negative values indicate error states.		
		Data type: INT		
		Value:	0	Function OK
			-1	No memory reserved for tool environments: MD18116 \$MN_MM_NUM_TOOL_ENV = 0 This means that the "tool environments" functionality is not available.
			-2	No more free memory locations for tool environments available.
			-3	Null string illegal as name of a tool environment.
			-4	No parameter (<name>) specified.
Parameters				
1	<name>:	Name, under which the current data set should be saved. If a data set of the same name already exists, then it is overwritten. In this case, the status is "0".		
Data type: STRING				

Additional information

Base dimension/adaptor dimension – tool length compensation

When the tool magazine management is active (only available with the "Tool management" option!), the value of the following machine data defines whether the adapter length or the tool base dimension (cutting edge-specific parameters \$TC_DP21, \$TC_DP22 and \$TC_DP23) is incorporated in the calculation of the tool length:

MD18104 \$MN_MM_NUM_TOOL_ADAPTER (tool adapter in TO area).

Since a change to this machine data only takes effect after the control system has powered up, it is not saved in the tool environment.

Resulting length of toolholders with orientation capability and transformations:

Note

Both toolholders with orientation capability and transformations can use system variables or machine data, which act as additional tool length components, and which can be subjected partially or completely to the rotations performed. The resulting additional tool length components must also be saved when TOOLENV is called, because they represent part of the environment, in which the tool is used.

Adapter transformation

The adapter transformation is a property of the tool adapter and thus of the complete tool. It is, therefore, not part of a tool environment, which can be applied to another tool.

By saving the complete data necessary to determine the overall tool length, it is possible to calculate the effective length of the tool at a later point in time, even if the tool is no longer active or if the conditions of the environment (e.g. G codes or setting data) have changed. Similarly, the effective length of a different tool can be calculated assuming that it would be used under the same conditions as the tool, for which the status was saved.

Maximum number of data sets for tool environments

Machine data MD18116 \$MN_MM_NUM_TOOL_ENV is used to define the maximum number of data sets that can be saved to describe the tool environments. The data are in the TOA area. They are kept even when the control system is switched off.

Data cannot be backed up. This means that this data cannot be transferred between the different control systems.

11.12.2 Delete tool environment (DELTOOLENV)

The DELTOOLENV function is used to delete the data sets that are used to describe tool environments. Deletion means that the set of data stored under a particular name can no longer be accessed (an access attempt triggers an alarm).

Note

Data sets can only be deleted using the DELTOOLENV function, by an INITIAL.INI download or by a cold start (NC power up with default machine data). There are no additional automatic deletion operations.

Syntax

```
<Status> = DELTOOLENV (<name>)
<Status> = DELTOOLENV ()
```

Meaning

DELTOOLENV (. . .) :		Predefined function to delete a tool environment	
		Alone in the block:	Yes
<Status>:		Function return value. Negative values indicate error states.	
		Data type:	INT
		Value:	0 Function OK
		-1	No memory reserved for tool environments: MD18116 \$MN_MM_NUM_TOOL_ENV = 0 This means that the "tool environments" functionality is not available.
		-2	A tool environment with the specified name does not exist.
Parameters			
1	<name>:	Name of data set to be deleted	
		Data type:	STRING
DELTOOLENV () :			
		DELTOOLENV () deletes data sets describing tool environments without specifying a name	

11.12.3 Read T, D and DL number (GETTENV)

The GETTENV function is used to read the T, D and DL numbers stored in a tool environment.

Syntax

```
<Status> = GETTENV(<name>, <TDDL>)
```

Meaning

GETTENV(...):		Predefined function to read T, D and DL numbers in a data set to describe a tool environment	
		Alone in the block:	Yes
<Status>:		Function return value. Negative values indicate error states.	
		Data type:	INT
		Value:	0 Function OK
			-1 No memory reserved for tool environments: MD18116 \$MN_MM_NUM_TOOL_ENV = 0 This means that the "tool environments" functionality is not available.
			-2 A tool environment with the specified name does not exist.
Parameters			
1	<name>:	Name of the data set from which the T, D and DL numbers are to be read	
		Data type:	STRING
2	<TDDL>:	The field of this result parameter contains the T, D and DL numbers of the tool, whose tool environment is saved in the specified data set:	
		<ul style="list-style-type: none"> • <TDDL> [0]: T number • <TDDL> [1]: D number • <TDDL> [2]: DL number 	
		Data type:	INT[3]
GETTENV(, <TDDL>), GETTENV("", <TDDL>):		When calling function GETTENV, it is permissible to omit the first parameter – or to transfer the null string as first parameter. In these two special cases, in <TDDL>, the T, D and DL numbers of the active tool are returned.	

11.12.4 Read information about the saved tool environments (\$P_TOOLENVN, \$P_TOOLENV)

Information regarding the saved tool environments can be read using the following system variables:

\$P_TOOLENVN:	Supplies the number of data sets (which have still not been deleted) – defined using TOOLENV – to describe tool environments			
	Syntax:	<n> = \$P_TOOLENVN		
	Meaning:	<n>:	Number of defined data sets	
			Data type:	INT
			Value range:	0 ... MD18116 \$MN_MM_NUM_TOOL_ENV
This system variable can be accessed even if no tool environments are possible (MD18116 = 0). In this case, the return value is "0".				

\$P_TOOLENV:	Supplies the name of the <i>th data set to describe a tool environment			
	Syntax:	<Name> = \$P_TOOLENV[<i>]		
	Meaning:	<name>:	Name of the data set with number <i>	
			Data type:	STRING
		<i>:	Number of the data set	
			Data type:	INT
			Value range:	1 ... \$P_TOOLENVN
The assignment of numbers to data sets is not fixed, but can be changed as a result of deleting or creating data sets. The data sets are numbered internally. If <i> refers to a data set that has not been defined, then the null string is returned. If index <i> is not valid, i.e. <i> is less than 1 or higher than that the maximum number of data sets for tool environments (MD18116 \$MN_MM_NUM_TOOLENV), then the following alarm is output: Alarm 17020 "inadmissible array index 1"				

11.12.5 Read tool lengths and/or tool length components (GETTCOR)

The GETTCOR function is used to read out tool lengths or tool length components.

The parameters can be used to specify which components are considered and the conditions under which the tool is used.

Syntax

```
<Status> = GETTCOR(<Len>[, <Comp>, <Stat>, <T>, <D>, <DL>])
```

Meaning

GETTCOR(...):	Predefined function to read tool lengths or to read tool length components	
	Alone in the block:	Yes

<Status>:		Function return value. Negative values indicate error states.	
		Data type:	INT
		Value:	0 Function OK
		-1	No memory reserved for tool environments: MD18116 \$MN_MM_NUM_TOOL_ENV = 0 This means that the "tool environments" functionality is not available.
		-2	A tool environment with the name specified under <Stat> does not exist.
		-3	Invalid string in parameter <Comp>. Causes of this error can be invalid characters or characters programmed twice.
		-4	Invalid T number
		-5	Invalid D number
		-6	Invalid DL number
		-7	Attempt to access a non-existent memory module.
		-8	Attempt to access a non-existent option (programmable tool orientation, tool management).
		-9	The <Comp> string contains a colon (identifier for the specification of a coordinate system), but it is not followed by a valid character denoting the coordinate system.
Parameters			
1	<Len>:	Result vector	
		Data type:	REAL[11]
		<p>The vector components are arranged in the following order:</p> <ul style="list-style-type: none"> • <Len> [0]: Tool type • <Len> [1]: Cutting edge position • <Len> [2]: Abscissa • <Len> [3]: Ordinate • <Len> [4]: Applicate • <Len> [5]: Tool radius <p>The coordinate system defined in <Comp> and <Stat> is used as the reference coordinate system for the length components. If a coordinate system is not defined in <Comp>, then tool lengths are displayed in the machine coordinate system.</p> <p>The assignment of the abscissa, ordinate and applicate to the geometry axes depends on the active plane used in the tool environment. This means, for G17, the abscissa is parallel to X, with G18 it is parallel to Z, etc.</p> <p>Components <Len>[6] to <Len>[10] contain the additional parameters, which can be used to specify the geometry description of a tool (e.g. \$TC_DP7 to \$TC_DP11 for the geometry and the corresponding components for wear or sum and setup offsets).</p> <p>These 5 additional elements and the tool radius are only defined for components E, G, S, and W. Their evaluation does not depend on <Stat>. The corresponding values in <Len>[6] to <Len>[10] can thus only be not equal to zero if at least one of the four specified components is involved in the tool length calculation. The remaining components do not influence the result. The dimensions refer to the control's basic system (inch or metric).</p>	

2	<Comp>:	Tool length components (optional)	
		Data type:	STRING
		The character string consists of two substrings, which are separated from one another by a colon.	
		General form: "<SubStr_1> [: <SubStr_2>]"	
		<SubStr_1>:	The first substring designates the tool length components to be taken into account when calculating the tool length.
			The order of the characters in the substrings, and their notation (upper or lower case), is arbitrary. Any number of blanks or white spaces can be inserted between the characters.
			Note: It is not permissible that the characters in the substring are programmed twice.
			Charac- ters:
			- Minus symbol (only allowed as first character) The complete tool length is calculated, minus the components specified in the next string.
			C Adapter or tool base dimension (whichever of the two alternative components is active for the tool in use)
			E Setup offsets
			G Geometry
			K Kinematic transformation (is only evaluated for generic 3, 4 and 5-axis transformation)
			S Summed offsets
			T Toolholder with orientation capability
			W Wear
		If the first substring is empty (except for white spaces), the complete tool length is calculated allowing for all components. This applies even if the <Comp> parameter is not specified.	
		<SubStr_2>:	The optional second substring identifies the coordinate system, in which the tool length is to be output.
			The second substring only comprises one single relevant character.
			Charac- ters:
			A Adjustable coordinate system (ACS)
			B Basic coordinate system (BCS)
			K Tool coordinate system of kinematic transformation (KCS)
			M Machine coordinate system (MCS)
			T Tool coordinate system (TCS)
			W Workpiece coordinate system (WCS)
			If no coordinate system is specified, the evaluation is performed in the MCS (machine coordinate system). If any rotations are to be taken into account, they are specified in the tool environment defined in <Stat>.
3	<_Stat>:	Name of the data set for describing a tool environment (optional)	
		Data type:	STRING
		If the value of this parameter is the null string (""), or is not specified, then the current status is used. The current tool is used if a tool is not specified.	

4	<T>:	Internal T number of the tool (optional).	
		Data type:	INT
		If this parameter is not specified or if its value is "0", then the tool stored in <Stat> is used.	
		If the value of this parameter is "-1", then the T number of the active tool is used. It is also possible to explicitly specify the number of the active tool. Note: If <Stat> is not specified, the actual status is used as the tool environment. Since <T> = 0 refers to the T number saved in the tool environment, the active tool is used in this environment, i.e. parameters <T> = 0 and <T> = -1 have the same meaning in this special case.	
5	<D>:	Cutting edge of the tool (optional).	
		Data type:	INT
		If this parameter is not specified, or if its value is "0", then the D number used is based on the source of the T number. If the T number from the tool environment is used, then the D number of the tool environment is also read, otherwise the D number of the currently active tool is read.	
6	<DL>:	Number of the offset dependent on the location (optional).	
		Data type:	INT
		If this parameter is not specified, then the DL number used is based on the source of the T number. If the T number from the tool environment is used, then the D number of the tool environment is also read, otherwise the D number of the currently active tool is read.	

Examples

GETTCOR (_LEN)	Calculates the tool length of the currently active tool in the machine coordinate system allowing for all components.
GETTCOR (_LEN, "CGW:W")	Calculates the tool length for the active tool, consisting of the adapter or tool base dimension, geometry and wear. Further components, such as toolholder with orientation capability or kinematic transformation, are not considered. Output in the workpiece coordinate system.
GETTCOR (_LEN, "-K:B")	Calculates the complete tool length of the active tool without allowing for the length components of a possibly active kinematic transformation. Output in the basic coordinate system.
GETTCOR (_LEN, ":M", "Testenv1", , 3)	Calculates the complete tool length in the machine coordinate system for the tool stored in the tool environment named "Testenv1". However, the calculation is performed for cutting edge number D3, regardless of the cutting edge number stored.

Additional information

Adapter transformation/toolholder with orientation capability/kinematic transformation

Any rotations and component exchanges initiated by the adapter transformation, toolholder with orientation capability and kinematic transformation, are part of the tool environment. They are thus always performed, even if the corresponding length component is not supposed to be included. If this is undesirable, tool environments must be defined, in which the corresponding transformations are not active. In many cases (i.e. any time a transformation or toolholder with orientation capability is not used on a machine), the data sets stored for the tool environments automatically fulfill these conditions, with the result that the user does not need to make special provision.

Turning and grinding tools: Calculating the tool length depending on MD20360 \$MC_TOOL_PARAMETER_DEF_MASK

The following machine data defines how the wear and tool length are to be evaluated if a diameter axis is used for turning and grinding tools.

MD20360 \$MC_TOOL_PARAMETER_DEF_MASK (definition of tool parameters).

Bit	Value
0	For turning and grinding tools, the wear parameter of the transverse axis is taken into account as the diameter value:
	= 0 (default) No
	= 1 Yes
1	For turning and grinding tools, the tool length component of the transverse axis is taken into account as the diameter value:
	= 0 (default) No
	= 1 Yes

If the bits involved are set, the associated entry is weighted with a factor of 0.5. This weighting is reflected in the tool length returned by GETTCOR.

Example:

MD20360 \$MC_TOOL_PARAMETER_DEF_MASK = 3

MD20100 \$MC_DIAMETER_AX_DEF (geometry axis with transverse axis function) = "X"

X is diameter axis (standard turning machine configuration)

Program code	Comment

Length components of the kinematic transformation and toolholder with orientation capability

If a **toolholder with orientation capability** is taken account of during the tool length calculation, the following vectors are included in that calculation:

Type	Vectors
M	I1 and I2
T	I1, I2 and I3
P	The tool length is not influenced by the toolholder with orientation capability.

In generic **5-axis transformation**, the following machine data are included in the tool length calculation for transformer types 24 and 56:

Transformation type	Machine data
24	MD24550/24650 \$MC_TRAFO5_BASE_TOOL_1/2 MD24560/24660 \$MC_TRAFO5_JOINT_OFFSET_1/2 MD24558/24658 \$MC_TRAFO5_PART_OFFSET_1/2
56	MD24550/24650 \$MC_TRAFO5_BASE_TOOL_1/2 MD24560/24660 \$MC_TRAFO5_JOINT_OFFSET_1/2

Transformation type 56 (moving tool and moving workpiece) corresponds to type M for toolholders with orientation capability.

For this 5-axis transformation, in the previous software releases, vector MD24560/24660 \$MC_TRAFO5_JOINT_OFFSET_1/2 (vector of kinematic offset of the 1st/2nd 5-axis transformation in the channel) corresponds to the sum of the two vectors I_1 and I_3 for a type M tool carrier with orientation capability.

Only the sum is relevant for the transformation in both cases. The way, in which the two individual components are composed, is insignificant. However, when calculating the tool length, it is relevant which component is assigned to the tool and which is assigned to the tool table. This is the reason that machine data MD24558/24658 \$MC_TRAFO5_JOINT_OFFSET_PART_1/2 (vector kinematic offset in table) was introduced. It corresponds to vector I_3 . Machine data:MD24560/24660 \$MC_TRAFO5_JOINT_OFFSET_1/2 no longer corresponds to the sum of I_1 and I_3 , but only to vector I_1 . If machine data MD24558/24658 \$MC_TRAFO5_JOINT_OFFSET_PART_1/2 is equal to zero, the behavior is the same as before.

Compatibility

The GETTCOR function is used in conjunction with the TOOLENV and SETTCOR functions to replace parts of the functionality, which were previously implemented externally in the measuring cycles.

Only some of the parameters, which actually determine the effective tool length, were implemented in the measuring cycles. The functions mentioned above can be configured to reproduce the behavior of the measuring cycles in relation to the tool length calculation.

11.12.6 Change tool components (SETTCOR)

The SETTCOR function is used to change tool components taking into account all general conditions that can be involved when evaluating the individual components.

Note

Regarding the terminology: If in the following, in conjunction with the tool length, tool components are involved, then the components considered from a vectorial perspective are meant, which make up the complete tool length (e.g. geometry or wear). Such a component comprises three individual values (L1, L2, L3), which are called coordinate values in the following.

The tool component "geometry" therefore comprises three coordinate values \$TC_DP3 to \$TC_DP5.

Syntax

```
<Status> = SETTCOR(<CorVal>, <Comp>, [<CorComp>, <CorMode>, <GeoAx>, <Stat>, <T>, <D>, <DL>])
```

Meaning

SETTCOR(...):	Predefined function to change tool components	
	Alone in the block:	Yes

<Status>:		Function return value. Negative values indicate error states.	
		Data type:	INT
		Value:	0 Function OK
		-1	No memory reserved for tool environments: MD18116 \$MN_MM_NUM_TOOL_ENV = 0 This means that the "tool environments" functionality is not available.
		-2	A tool environment with the name specified under <Stat> does not exist.
		-3	Invalid string in parameter <Comp>. Causes of this error can be invalid characters or characters programmed twice.
		-4	Invalid T number.
		-5	Invalid D number.
		-6	Invalid DL number.
		-7	Attempt to access a non-existent memory module.
		-8	Attempt to access a non-existent option (programmable tool orientation, tool management).
		-9	Illegal numerical value for parameter <CorComp>.
		-10	Illegal numerical value for parameter <CorMode>.
		-11	The contents of parameters <Comp> and <CorComp> are contradictory.
		-12	The contents of parameters <Comp> and <CorMode> are contradictory.
		-13	The content of the <GeoAx parameter does not designate a geometry axis.
		-14	Write attempt to a non-existent setup offset.
Parameters			
1	<CorVal>:	<p>Correction vector</p> <p>In the workpiece coordinate system (WCS) defined by <Stat>, the following assignment applies:</p> <ul style="list-style-type: none"> • <CorVal> [0]: Abscissa • <CorVal> [1]: Ordinate • <CorVal> [2]: Applicate <p>If only one tool component is to be corrected (i.e. no vectorial correction, see parameter <CorMode>), the correction value is always in <CorVal>[0], independent of the axis on which it acts. The contents of the other two components are then not evaluated.</p> <p>If <CorVal> or a component of <CorVal> refers to the transverse axis, then the data is evaluated as radius dimension. This means that a tool is, for example, "longer" by the specified dimension; this correspondingly results in a change to the workpiece diameter that is twice as large.</p> <p>The dimensions refer to the basic system (inch or metric) of the control system.</p>	
		Data type:	REAL[3]

2	<Comp>:	Tool component(s)		
		Data type:	STRING	
		The character string consists of two substrings, which are separated from one another by a colon.		
		General form: "<SubStr_1> [: <SubStr_2>]"		
		<SubStr_1>:	The first substring must always be available, and can either comprise one or two characters. The first or only character for the 1st component (Val ₁) and the second character for the 2nd component (Val ₂), which are processed according to the subsequent parameters <CorComp> and <CorMode>.	
		Charac- ters:	C	Adapter or tool base dimension (whichever of the two alternative components is active for the tool in use)
			E	Setup offsets
			G	Geometry
			S	Sum offsets
			W	Wear
		<Substr_2>:	The second substring is optional. Alternatively, it can comprise (individual) letters "W" or "T".	
		Charac- ters:	W	If the second substring is empty or contains the letter "W", then the offset values are taken into account as if they had been measured in the workpiece coordinate system (WCS).
T	If the second substring contains the letter "T", then the offset values are taken into account as if they had been measured in the tool coordinate system (T ool Coordinate System, TCS).			
The notation of the characters in the string (upper or lower case) is arbitrary. Any number of spaces or tabs (white spaces) can be inserted.				

3	<CorComp>:	Specifies the component(s) of the tool data sets that are to be described (optional).		
		Data type: INT		
		Value:	0	Offset value <CorVal>[0] refers to the geometry axis transferred in parameter <GeoAx> in the workpiece coordinate system – or in the tool coordinate system (also see a description of parameter <Comp>). This means that the offset value must be calculated in the designated tool components so that, taking account all the parameters that can influence the tool length calculation, a change of the total tool length by the specified value in the specified axis direction is obtained. This change should be achieved by correcting the component specified in <Comp> and the symbolic algorithm specified in <CorMode> (see the following parameters). The resulting correction can therefore have an effect on all three axis components.
			1	Like "0", however, vectorial. The content of vector <CorVal> refers to abscissa, ordinate and applicate in the workpiece coordinate system or tool coordinate system (see the description of parameter <Comp>). Subsequent parameter <GeoAx> is not evaluated.
			2	Vectorial offset, i.e. L1, L2 and L3 can change simultaneously. In contrast to the versions from "0 and "1", the offset values contained in <CorVal> refer to the coordinates of Val ₁ components (see following parameter <CorMode>) of the tool. Any possible inclination of an existing tool compared with the workpiece coordinate system has no influence on the offset.
			3 - 5	Correction of tool lengths L1 to L3 (\$TC_DP3 to \$TC_DP5) or the corresponding values for wear, setting up or additive offsets. The offset value is contained in <CorVal>[0]. It is measured in the coordinates of the Val ₁ component (see following parameter <CorMode>) of the tool. Any possible inclination of an existing tool compared with the workpiece coordinate system has no influence on the offset.
			6	Correction of the tool radius (\$TC_DP6) or the corresponding values for wear, setting up or additive offsets. Bits 10 and 11 (evaluation of the diameter and/or diameter wear data, either specified as a radius or diameter) in machine data MD20360 \$MC_TOOL_PARAMETER_DEF_MASK are taken into account.
			7 – 11	Correction of \$TC_DP7 to \$TC_DP11 or the corresponding values for wear, setting up or additive offsets. These parameters are treated just like the tool radius.
		If this parameter is not specified then its value is "0".		

4	<CorMode>:	Specifies the type of write operation to be executed (optional).		
		Data type:	INT	
		Value:	0	$Val_{1new} = <CorVal>$
			1	$Val_{1new} = Val_{1old} + <CorVal>$
			2	$Val_{1new} = <CorVal>$ $Val_{2new} = 0$
	3		$Val_{1new} = Val_{1old} + Val_{2old} + <CorVal>$ $Val_{2new} = 0$	
	<p>The notation $Val_{1old} + Val_{2old}$ is symbolic. If the two components (due to the status of $<_Stat>$) are evaluated in different ways, i.e. if a rotation is effective between the two components, then Val_{2old} is transformed prior to addition so that the resulting tool length after deleting Val_{2new} and prior to the addition of $<CorVal>$ remains unchanged.</p> <p>$<CorVal>$ always refers to Val_1. $<CorVal>$ is a value, which dependent on the second part of parameter $<Comp>$, is measured in the workpiece coordinate system (WCS) or in the tool coordinate system (TCS). It is therefore already transformed with respect to the tool components, in which it should be calculated. Therefore, it cannot be directly calculated together with the saved value, but must be transformed back prior to adding to Val_1 or Val_2. This can mean that the offset acts on an axis different than the one defined by $<CorComp>$ – or that it acts on several axes.</p> <p>For the case $<CorComp> = 0$, i.e. when $<CorVal>$ does not contain a vector, but only an individual value, then the described operations are executed in the coordinates in which $<CorVal>$ was measured (WCS/TCS). In particular, this also applies to setting Val_{2new} to zero in variants 2 and 3. This result is then transformed back into the coordinates of the tool. This can mean that none of the coordinate values to be set to zero (L_1, L_2, L_3) become zero, or coordinate values, that were previously zero, are now not equal to zero. However, if the corresponding operations are successively executed for all three geometry axes, then it is guaranteed that all three coordinate values of the components to be deleted are zero. If the tool is not rotated with respect to the workpiece coordinate system or is rotated so that all tool components remain parallel to the coordinate axes (axis exchange operations), then this also ensures that only one tool coordinate changes.</p> <p>The successive execution of the same operation ($<CorMode>$) with $<CorComp> = 0$ for all three coordinate axes in any sequence is identical with the single execution of the same operation with $<CorComp>=1$.</p> <p>For parameter values "0" and "1", parameter $<Comp>$ must contain one character, and for parameter values "2" and "3", two characters.</p> <p>Example:</p> <p>$<Comp>$ contains string "ES", $<CorMode>$ the value "2"</p> <p>\Rightarrow Setup offset_{new} = $<CorVal>$, summed offset_{new} = 0</p> <p>If parameter $<CorMode>$ is not specified, then its value is "0".</p>			
	<GeoAx>:	Specifies the index of the geometry axis in which the offset value $<CorVal>[0]$ was read (optional)		
		Data type:	INT	
		Value range:	0 ... 2	
<p>Indices 0 to 2 refer to abscissa, ordinate and applicate in the active plane (G17/ G18/G19) of the current tool environment.</p> <p>The content of this parameter is only evaluated if parameter $<CorComp>$ has a value of "0".</p>				

6	<Stat>:	Name of the data set for describing a tool environment (optional)
		Data type: STRING
		If the value of this parameter is the null string (""), or is not specified, then the current status is used. The current tool is used if a tool is not specified.
7	<T>:	Internal T number of the tool (optional).
		Data type: INT
		<p>If this parameter is not specified or if its value is "0", then the tool stored in <Stat> is used.</p> <p>If the value of this parameter is "-1", then the T number of the active tool is used. It is also possible to explicitly specify the number of the active tool.</p> <p>Note: If <Stat> is not specified, the actual status is used as the tool environment. Since <T> = 0 refers to the T number saved in the tool environment, the active tool is used in this environment, i.e. parameters <T> = 0 and <T> = -1 have the same meaning in this special case.</p>
8	<D>:	Cutting edge of the tool (optional).
		Data type: INT
		If this parameter is not specified, or if its value is "0", then the D number used is based on the source of the T number. If the T number from the tool environment is used, the D number of the tool environment is also read, otherwise the D number of the currently active tool is read.
9	<TL>:	Number of the offset dependent on the location (optional).
		Data type: INT
		If this parameter is not specified, then the DL number used is based on the source of the T number. If the T number from the tool environment is used, the D number of the tool environment is also read, otherwise the D number of the currently active tool is read. If T, D and DL specify a tool without location-dependent offsets, no summed or setup offsets may be specified in parameter <Comp> (error code in <Status>).

Note

Not all possible combinations of the three parameters <Comp>, <CorComp> and <CorMode> make sense. For example, algorithm 3 in <CorComp> requires that two characters are specified in <Comp>. If an invalid parameter combination is specified, then a corresponding error code is returned in the <Status>.

Examples**Example 1**

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=120	; Milling tool
N30 \$TC_DP3[1,1]=10.0	; Geometry L1
N40 \$TC_DP12[1,1]=1.0	; wear L1
N50 _CORVAL[0]=0.333	
N60 T1 D1 G17 G0	

Program code	Comment
N70 R1=SETTCOR(_CORVAL,"G",0,0,2)	
N80 T1 D1 X0 Y0 Z0	; ==> MCS position X0.000 Y0.000 Z1.333
N90 M30	

<CorComp> is "0", therefore, the coordinate value of the geometry component acting in the Z direction must be replaced by the offset value 0.333.

The resulting total tool length is thus: $L1 = 0.333 + 1.000 = 1.333$

Example 2

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=120	; milling tool
N30 \$TC_DP3[1,1]=10.0	; geometry L1
N40 \$TC_DP12[1,1]=1.0	; wear L1
N50 _CORVAL[0]=0.333	
N60 T1 D1 G17 G0	
N70 R1=SETTCOR(_CORVAL,"W",0,1,2)	
N80 T1 D1 X0 Y0 Z0	; ==> MCS position X0.000 Y0.000 Z11.333
N90 M30	

<CorComp> is "1", this means that the offset value of 0.333 – acting in the Z axis – is added to the wear value of 1.0.

The resulting total tool length is thus: $L1 = 10.0 + 1.333 = 11.333$

Example 3

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=120	; Milling tool
N30 \$TC_DP3[1,1]=10.0	; Geometry L1
N40 \$TC_DP12[1,1]=1.0	; Wear L1
N50 _CORVAL[0]=0.333	
N60 T1 D1 G17 G0	
N70 R1=SETTCOR(_CORVAL,"GW",0,2,2)	
N80 T1 D1 X0 Y0 Z0	; ==> MCS position X0.000 Y0.000 Z0.333
N90 M30	

<CorComp> is "2", therefore, the offset effective in the Z axis is entered in the geometry component (the old value is overwritten) and the wear value is deleted.

The resulting total tool length is thus: $L1 = 0.333 + 0.0 = 0.333$

Example 4

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=120	; Milling tool
N30 \$TC_DP3[1,1]=10.0	; Geometry L1

Program code	Comment
N40 \$TC_DP12[1,1]=1.0	; wear L1
N50 _CORVAL[0]=0.333	
N60 T1 D1 G17 G0	
N70 R1=SETTCOR(_CORVAL,"GW",0,3,2)	
N80 T1 D1 X0 Y0 Z0	; ==> MCS position X0.000 Y0.000 Z11.333
N90 M30	

<CorComp> is "3", therefore, the wear value and compensation value are added to the geometry component and the wear component is deleted.

The resulting total tool length is thus: $L1 = 11.333 + 0.0 = 11.333$

Example 5

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=120	; Milling tool
N30 \$TC_DP3[1,1]=10.0	; Geometry L1
N40 \$TC_DP12[1,1]=1.0	; Wear L1
N50 _CORVAL[0]=0.333	
N60 T1 D1 G17 G0	
N70 R1=SETTCOR(_CORVAL,"GW",0,3,0)	
N80 T1 D1 X0 Y0 Z0	; ==> MCS position X0.333 Y0.000 Z11.000
N90 M30	

<CorComp> is "3", as in the previous example, but the compensation is now effective on the geometry axis with index "0" (X axis), which for a milling tool, is assigned to tool component L3 due to G17. As a consequence, when calling SETTCOR, tool parameters \$TC_DP3 and \$TC_DP12 are not influenced. Instead, the compensation value is entered in \$TC_DP5.

Example 6

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=500	; turning tool
N30 \$TC_DP3[1,1]=10.0	; geometry L1
N40 \$TC_DP4[1,1]=15.0	; geometry L2
N50 \$TC_DP12[1,1]=10.0	; wear L1
N60 \$TC_DP13[1,1]=0.0	; wear L2
N70 _CORVAL[0]=5.0	
N80 ROT Y-30	
N90 T1 D1 G18 G0	
N100 R1=SETTCOR(_CORVAL,"GW",0,3,1)	
N110 T1 D1 X0 Y0 Z0	; ==> MCS position X24.330 Y0.000 Z17.500
N120 M30	

The tool is a turning tool. A frame rotation is activated in N80, causing the basic coordinate system (BCS) to be rotated in relation to the workpiece coordinate system (WCS). In the WCS, the compensation value (N70) acts on the geometry axis with index 1, i.e. on the X axis because

G18 is active. Since $\langle \text{CorMode} \rangle = 3$, the tool wear in the direction of the X axis of the WCS must become zero once N100 has been executed.

The contents of the relevant tool parameters at the end of the program are thus:

\$TC_DP3[1,1]: 21.830 ; geometry L1

\$TC_DP4[1,1] : 21.830 ; geometry L2

\$TC_DP12[1,1] : 2.500 ; wear L1

\$TC_DP13[1,1] : -4.330 ; wear L2

The geometrical relationships are shown in the figure below: The total wear including $_CORVAL$ is mapped onto the X' direction in the WCS. This produces point P2. The coordinates of this point (measured in X/Y coordinates) are entered in the geometry component of the tool. The difference vector $P_2 - P_1$ remains in the wear. The wear thus no longer has a component in the direction of $_CORVAL$.

If the program example is continued after N110 with the following instructions, then the remaining wear is included completely in the geometry because the compensation is now effective in the Z' axis (parameter $\langle \text{GeoAx} \rangle = 0$):

```
N120 _CORVAL[0]=0.0
N130 R1=SETTCOR(_CORVAL,"GW",0,3,0)
N140 T1 D1 X0 Y0 Z0 ; ==> MCS position X24.330 Y0.000 Z17.500
```

Since the new compensation value is "0", the total tool length and thus the position approached in N140 may not change. If $_CORVAL$ were not equal to "0" in N120, a new total tool length and thus a new position in N140 would result, however, the wear component of the tool length would always be zero, i.e. the total tool length is subsequently always contained in the geometry component of the tool.

The same result as that achieved by calling the SETTCOR function with the <CorComp> = 0 parameter twice can also be reached by calling <CorComp> = 1 (vectorial compensation) just once:

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=500	; turning tool
N30 \$TC_DP3[1,1]=10.0	; geometry L1
N40 \$TC_DP4[1,1]=15.0	; geometry L2
N50 \$TC_DP12[1,1]=10.0	; wear L1
N60 \$TC_DP13[1,1]=0.0	; wear L2
N70 _CORVAL[0]=0.0	
N71 _CORVAL[1]=5.0	
N72 _CORVAL[2]=0.0	
N80 ROT Y-30	
N90 T1 D1 G18 G0	
N100 R1=SETTCOR(_CORVAL,"GW",1,3,1)	
N110 T1 D1 X0 Y0 Z0	; ==> MCS position X24.330 Y0.000 Z17.500
N120 M30	

In this case, all wear components of the tool are set to zero immediately after the first call of SETTCOR in N100.

Example 7

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=500	; turning tool
N30 \$TC_DP3[1,1]=10.0	; geometry L1
N40 \$TC_DP4[1,1]=15.0	; geometry L2
N50 \$TC_DP12[1,1]=10.0	; wear L1
N60 \$TC_DP13[1,1]=0.0	; wear L2
N70 _CORVAL[0]=5.0	
N80 ROT Y-30	
N90 T1 D1 G18 G0	
N100 R1=SETTCOR(_CORVAL,"GW",3,3)	
N110 T1 D1 X0 Y0 Z0	; ==> MCS position X25.000 Y0.000 Z15.000
N120 M30	

When compared to example 6, parameter <CorComp> = 3, and so the <GeoAx> parameter can be omitted. The value contained in _CORVAL[0] now acts immediately on the tool length component L1, the rotation in N80 has no effect on the result, the wear components in \$TC_DP12 are included in the geometry component together with _CORVAL[0], with the result that the total tool length is stored in the geometry component of the tool, due to \$TC_DP13, after the first SETTCOR call in N100.

Example 8

Program code	Comment
N10 DEF REAL _CORVAL[3]	
N20 \$TC_DP1[1,1]=500	; turning tool
N30 \$TC_DP3[1,1]=10.0	; geometry L1
N40 \$TC_DP4[1,1]=15.0	; geometry L2
N50 \$TC_DP5[1,1]=20.0	; geometry L3
N60 \$TC_DP12[1,1]=10.0	; wear L1
N70 \$TC_DP13[1,1]=0.0	; wear L2
N80 \$TC_DP14[1,1]=0.0	; wear L3
N90 \$SC_WEAR_SIGN=TRUE	
N100 _CORVAL[0]=10.0	
N110 _CORVAL[1]=15.0	
N120 _CORVAL[2]=5.0	
N130 ROT Y-30	
N140 T1 D1 G18 G0	
N150 R1=SETTCOR(_CORVAL,"W",1,1)	
N160 T1 D1 X0 Y0 Z0	; ==> MCS position X7.990 Y25.000 Z31.160
N170 M30	

Setting data:SD42930 \$SC_WEAR_SIGN is enabled in N90, i.e. the wear must be evaluated with a negative sign. The compensation is vectorial (<CorComp> = 1), and the compensation vector must be added to the wear (<CorMode> = 1). The geometrical relationships in the Z/X plane are shown in the diagram below:

The geometry component of the tool remains unchanged due to <CorMode> = 1. The compensation vector defined in the WCS (rotation around the y axis) must be included in the wear component such that the total tool length in Fig. 3 refers to point P₂. Therefore, the resulting wear component of the tool is given by the distance of the two points P₁ and P₂.

However, since the wear is evaluated negatively, due to setting data SD42930 \$SC_WEAR_SIGN, the compensation determined in this way has to be entered in the compensation memory with a negative sign. The contents of the relevant tool parameters at the end of the program are thus:

```
$TC_DP3[1,1]: 10.000 ; geometry L1 (unchanged)
$TC_DP4[1,1] : 15.000 ; geometry L2 (unchanged)
$TC_DP5[1,1]: 10.000 ; geometry L3 (unchanged)
$TC_DP12[1,1] : 2.010 ; wear L1 (= 10 - 15 * cos(30) + 10 * sin(30))
$TC_DP13[1,1] : -16.160 ; wear L2 (= -15 * sin(30) - 10 * cos(30))
$TC_DP14[1,1] : -5.000 ; wear L3
```

The effect of setting data SD42930 \$SC_WEAR_SIGN on the L3 component in the Y direction can be recognized without the additional complication caused by the frame rotation.

Additional information

Turning/grinding tools: Calculating the tool length depending on MD20360 \$MC_TOOL_PARAMETER_DEF_MASK

The following machine data defines how the wear and tool length are to be evaluated if a diameter axis is used for turning/grinding tools:

MD20360 \$MC_TOOL_PARAMETER_DEF_MASK.<Bit> = <Value>

<Bit>	<Value>	Meaning
0	0	For turning/grinding tools, the wear parameter of the transverse axis is taken into account in the radius value :
	1	For turning/grinding tools, the wear parameter of the transverse axis is taken into account as the diameter value :
1	0	For turning/grinding tools, the tool length component of the transverse axis is taken into account as the radius value :
	1	For turning/grinding tools, the tool length component of the transverse axis is taken into account as the diameter value :

If the bits involved are set, the associated entry is weighted with a factor of 0.5. The correction using SETTCOR is executed so that the total effective tool length change is equal to the value transferred in <CorVal>. If, when calculating the length, a length is evaluated with a factor of 0.5 as a result of machine data MD20360 \$MC_TOOL_PARAMETER_DEF_MASK, then the compensation of this component must be realized with twice the value transferred.

Example

MD20360 \$MC_TOOL_PARAMETER_DEF_MASK = 2 (tool length must be evaluated in the diameter axis using a factor of 0.5)

Axis X is the diameter axis.

N170 M30	

In each axis, the tool length compensation should be 1 mm (N80 to N100). 1 mm is thus added to the original length in lengths L2 and L3. Twice the compensation value (2 mm) is added to the original tool length in L1, in order to change the total length by 1 mm as required. If the positions approached in blocks N110 and N130 are compared, it can be seen that each axis position has changed by 1 mm.

11.13 Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX)

11.13 Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX)

The LENTOAX function provides information about the assignment of tool lengths L1, L2 and L3 of the **active** tool to the abscissa, ordinate and applicate. The assignment of abscissa, ordinate and applicate to the geometry axes is affected by frames and the active plane (G17 - G19).

Only the geometry component of a tool (\$TC_DP3[<t>,<d>] to \$TC_DP5[<t>,<d>]) is considered, i.e. a different axis assignment for other components (e.g. wear) has no effect on the result.

Syntax

```
<Status> = LENTOAX(<AxInd>, <Matrix>[, <Coord>])
```

Principle

LENTOAX (. . .):		Predefined function to read the assignment of tool lengths L1, L2 and L3 of the active tool to the coordinate axes	
		Alone in the block:	Yes
<Status>:	Function return value. Negative values indicate error states.		
	Data type:		INT
	Value:	0	Function OK Information provided in <AxInd> is sufficient for the description (all tool length components are in parallel to the geometry axes).
		1	Function is OK, however, the content of <Matrix> must be evaluated for a correct description (the tool length components are not parallel to the geometry axes).
		-1	Invalid string in parameter <Coord>.
-2		No tool active.	
Parameters			

11.13 Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX)

1	<AxInd>:	If the tool length components are parallel to the geometry axes, the axis indices assigned to length components L1 to L3 are returned in the <AxInd> array.	
		<ul style="list-style-type: none"> • <AxInd> [0]: Abscissa • <AxInd> [1]: Ordinate • <AxInd> [2]: Applicate 	
		Data type:	INT[3]
		Value:	0
			No assignment exists (axis does not exist)
2	<Matrix>:	1 ... 3 or -1 ... -3	Number of the length effective in the corresponding coordinate axis. The sign is negative if the tool length component is pointing in the negative coordinate direction.
		If not all length components are parallel or antiparallel to the geometry axes, the index of the axis, which contains the largest part of a tool length component, is returned in <AxInd>. In this case (if the function does not return an error for a different reason), then the return value is <Status> = 1. The mapping of tool length components L1 to L3 to geometry axes 1 to 3 is then described completely by the content of the 2nd parameter <Matrix>.	
		Data type:	REAL
		All elements are always valid in the matrix, even if the geometry axis belonging to the coordinate axis is not available, i.e. if the corresponding entry in <AxInd> is 0.	
3	<Coord>:	coordinate system applicable for the assignment (optional)	
		Data type:	STRING
		Characters:	MCS M
			The tool length is represented in the machine coordinate system.
			BCS B
			The tool length is represented in the basic coordinate system.
			WCS W
			The tool length is represented in the workpiece coordinate system (default setting).
		KCS K	The tool length is represented in the tool coordinate system of the kinematic transformation.
			TCS T
		The notation of the characters in the string (upper or lower case) is arbitrary. If the parameter <Coord> is not specified, then WCS is used (default setting).	

Note

In the TCS, all tool length components are always parallel or antiparallel to the axes.

The components can only be antiparallel when mirroring is active and the following setting data is activated:

SD42900 \$SC_MIRROR_TOOL_LENGTH (sign change tool length when mirroring)

11.13 Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX)
Example

Standard application, milling tool for G17.

L1 applies in Z (applicate), L2 applies in Y (ordinate), L3 applies in X (abscissa).

Function call in the form:

```
<Status>=LENTOAX(<AxInd>,<Matrix>,"WCS")
```

The result parameter <AxInd> then contains the values:

```
<AxInd>[0] = 3
```

```
<AxInd>[1] = 2
```

```
<AxInd>[2] = 1
```

Or, in short: (3, 2, 1)

In this case, the associated matrix (<Matrix>) is:

$$\text{<Matrix>} = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

A change from G17 to G18 or G19 does not alter the result, because the assignment of the length components to the geometry axes changes in the same way as the assignment of the abscissa, ordinate and applicate.

A frame rotation of Z through 60 degrees is now programmed with G17 active, e.g.

```
ROT Z60
```

The direction of the applicate (Z direction) remains unchanged; the main component of L2 now lies in the direction of the new X axis; the main component of L1 now lies in the direction of the negative Y axis. As a consequence, the return value (<Status>) is "1", <AxInd> contains the values (2, -3, 1).

In this case, the associated matrix (<Matrix>) is:

$$\text{<Matrix>} = \begin{pmatrix} 0 & \sin 60^\circ & \cos 60^\circ \\ 0 & \cos 60^\circ & -\sin 60^\circ \\ 1 & 0 & 0 \end{pmatrix}$$

11.13 Read the assignment of the tool lengths L1, L2, L3 to the coordinate axes (LENTOAX)

Path traversing behavior

12.1 Tangential control

12.1.1 Defining coupling (TANG)

Via the predefined procedure TANG(...), a tangential coupling between a rotary axis is defined as the following axis and two geometry axes as the leading axes. The following axis is continuously aligned with the path tangent of the leading axes.

Note

Coupling factor

A coupling factor of 1 does not have to be programmed explicitly.

The direction of the tangential axis is rotated using the coupling factor of -1.

Syntax

TANG(<following axis>, <leading axis_1>, <leading axis_2>, <coupling factor>, <coordinate system>, <optimization>)

Meaning

TANG (...):	Define tangential coupling		
<following axis>:	Axis name of the following axis (rotary axis)		
	Data type:	AXIS	
	Range of values:	Channel axis names	
<leading axis_1> <leading axis_2>:	Axis names of the leading axes (geometry axes) ¹⁾		
	Data type:	AXIS	
	Range of values:	Geometry axis names of the channel	
<coupling factor>:	Factor n of the angle change of the following axis for changing the path tangent of the leading axes: Angle change _{following axis} = angle change _{path tangent} * n		
	Data type:	REAL	
	Default value:	1.0	
<coordinate system>:	Active coordinate system ²⁾		
	Data type:	CHAR	
	Value:	"B":	Basic coordinate system (default value)
		"W":	Workpiece coordinate system (not available)

<optimization>:	Optimization type	
	Data type:	CHAR
	Value:	<div>"S": Standard (default value) The dynamic response of the rotary axis has no effect on the leading axes. If the dynamic response of the rotary axis is greater than required for tracking, this method is sufficiently precise. If the dynamic response of the rotary axis is not great enough to follow the change in the path tangent, the orientation of the rotary axis will deviate from the target orientation along an undefined rounding clearance.</div> <div>"P": The dynamic response of the rotary axis is considered in the path planning of the leading axes. For this purpose, on activation of the tangential coupling with TANGON(), two additional parameters must be specified: <ul style="list-style-type: none"> • Rounding clearance • Angular tolerance See Section "Activating the coupling (TANGON) (Page 503)" <p>Note With kinematic transformations, we recommend using optimization method "P."</p> </div>
<p>Note Default values do not have to be programmed explicitly.</p> <p>¹⁾ Note As the leading axes for tangential coupling, the geometry axes must be used that travel along the programmed path in the machine coordinate system (MCS) with reference to the initial position of the machine. For example, if swivel cycle CYCLE800 is used on a milling machine with a swivel head, depending on how the cycle is configured, interpolation will be performed in the WCS, e.g. with the geometry axes X and Y. The tangential coupling, however, must be defined with the geometry axes as the leading axes, which travel along the programmed path in the MCS. For this purpose, the geometry axes in the non-swiveled condition of the machine must be used as the leading axes.</p> <p>²⁾ Note The basic coordinate system (BCS) must not be rotated with respect to the MCS. For example, if the BCS is rotated with the ROT command or with the swivel cycle CYCLE800, the tangential control is no longer correct.</p>		

12.1.2 Activating intermediate block generation (TLIFT)

If the tangent change of the following axis at any position along the programmed path of the leading axes exceeds the limit parameterized in machine data MD37400 \$MA_EPS_TLIFT_TANG_STEP, further path planning will depend on the set behavior at corners. Without use of the predefined procedure TLIFT(...), the path is traversed in accordance with the rounding behavior programmed in connection with TANG(...) (Page 501) and TANGON(...) (Page 503).

Activating intermediate block generation

If TLIFT(...) is programmed after TANG(...), an intermediate block automatically generated by the control is inserted at this point when a corner is detected during preprocessing.

When the program is executed, the leading axes are stopped when the intermediate block is reached. In the intermediate block, the following axis is rotated with maximum axis dynamics toward the path tangent of the following block. The leading axes are then traversed further on the programmed path.

Deactivating intermediate block generation

To deactivate intermediate block generation, the tangential coupling must be defined again using TANG(...), but without subsequent activation of intermediate block generation by means of TLIFT(...).

Syntax

TLIFT(<following axis>)

Meaning

TLIFT(...):	Activate corner detection with intermediate block calculation	
<following axis>:	Axis name of the following axis (rotary axis)	
	Data type:	AXIS
	Range of values:	Channel axis names

Speed of rotation of the following axis**Path axis**

If the following axis had already been traversed as a path axis before tangential coupling was activated, the rotational movement is performed in the intermediate block as a path axis.

If you specify the reference radius with FGREF[<axis>]=0.001, the rotational movement will be performed with the parameterized maximum axis velocity:

MD32000 \$MA_MAX_AX_VELO[<following axis>]

Positioning axis

If the following axis had not yet been traversed as a path axis before tangential coupling was activated, the rotation is performed in the intermediate block as a positioning axis.

The rotational movement is performed with the parameterized positioning axis velocity:

MD32060 \$MA_POS_AX_VELO[<following axis>]

12.1.3 Activating the coupling (TANGON)

Via the predefined procedure TANGON(...), a tangential coupling previously defined with TANG(...) (Page 501) is activated. The following axis is then continuously aligned with the path tangent during subsequent travel.

Angle of the following axis

The angle of the following axis with respect to the path tangent depends on the transformation ratio specified in TANG(...), the offset angle parameterized in the machine data MD37402 \$MA_TANG_OFFSET, and the offset angle specified for TANGON(...), which is applied additively.

Optimization "P"

If the value "P" was specified as the optimization parameter in the definition of the tangential coupling (TANG(...)), the parameter "rounding clearance" and optionally the parameter "angular tolerance" must be set when coupling is activated.

If the value 0 is specified as the angular tolerance, only the parameter "rounding clearance" will be active.

If a value greater than 0 is specified as the angular tolerance, the active rounding clearance results from the minimum of the parameterized rounding clearance and the rounding clearance based on the parameterized angular tolerance.

If the dynamic response of the following axis is not sufficient to follow the parameterized conditions, the path velocity of the leading axes will be reduced accordingly.

Syntax

```
TANGON(<following axis>, <offset angle>, <rounding clearance>,
<angular tolerance>)
```

Meaning

TANGON(...):	Activate tangential coupling	
<following axis>:	Axis name of the following axis (rotary axis)	
	Data type:	AXIS
	Range of values:	Channel axis names
<offset angle>:	Offset angle of following axis with respect to the path tangent The reference point is the zero point of the rotary axis.	
	Data type:	REAL
<rounding clearance>:	Maximum permissible rounding clearance If the rounding clearance is increased due to the dynamic conditions, the path velocity of the leading axes is reduced.	
	Data type:	REAL
<angular tolerance>:	Maximum permissible tolerance with respect to the specified angle between the following axis zero setting and the path tangent	
	Data type:	REAL

12.1.4 Deactivating the coupling (TANGOF)

Via the predefined procedure TANGOF(...), a tangential coupling defined with TANG(...) (Page 501) and activated with TANGON(...) (Page 503) is deactivated. The following axis is then no longer aligned with the path tangent of the leading axis. However, the coupling of the following axis to the leading axes is retained even after deactivation, which prevents the following functions, for example:

- Plane change
- Geometry axis switchover
- Definition of a new tangential coupling for the following axis

Final cancellation of the connection of the coupling of the following axis to the leading axes is not completed until the coupling has been deleted with TANGDEL(...) (Page 505).

Programming

TANGOF(<following axis>)

Meaning

TANGOF (...):	Deactivate a tangential coupling	
<following axis>:	Axis name of the following axis (rotary axis)	
	Data type:	AXIS
	Range of values:	Channel axis names

12.1.5 Deleting a coupling (TANGDEL)

A tangential coupling defined with TANG(...) (Page 501) will be retained even after deactivation of the tangential coupling with TANGOF(...) (Page 505). The existing tangential coupling then continues to prevent, for example, the following functions:

- Plane change
- Geometry axis switchover
- Definition of a new tangential coupling for the following axis

With the predefined procedure TANGDEL(...), the existing tangential coupling is deleted after the tangential coupling has been deactivated with TANGOF(...).

Syntax

TANGDEL(<following axis>)

Meaning

TANGDEL (...):	Delete a tangential coupling defined with TANG()	
	Effective:	Non-modal

12.1 Tangential control

<following axis>:	Axis name of the following axis whose tangential coupling is to be deleted	
	Data type:	AXIS
	Range of values:	Channel axis names

Examples

Leading axis change

Before a new tangential coupling can be defined with another leading axis for the following axis, the existing tangential coupling must first be deleted.

Program code	Comment
N10 TANG (A, X, Y, 1)	; Define tangential coupling for following axis A: A to X and Y
N20 TANGON(A)	; Activate tangential coupling for following axis A
N30 X10 Y20	
...	
N80 TANGOF(A)	; Deactivate tangential coupling for following axis A
N90 TANGDEL (A)	; Delete tangential coupling for following axis A
...	
N120 TANG (A, X, Z)	; Define new tangential coupling for following axis A
N130 TANGON(A)	; Activate new tangential coupling for following axis A
...	

Geometry axis switchover

Before geometry axis switchover can be performed for an existing coupling, the coupling must first be deleted.

Program code	Comment
N10 GEOAX(2,Y1)	; 2nd geometry axis = machine axis Y1
N20 TANG(A, X, Y)	; Define tangential coupling for following axis A
N30 TANGON(A, 90)	; Activate tangential coupling for following axis A
N40 G2 F8000 X0 Y0 I0 J50	; Motion block
N50 TANGOF(A)	; Deactivate tangential coupling for following axis A
N60 TANGDEL (A)	; Delete tangential coupling for following axis A
N70 GEOAX (2, Y2)	; 2nd geometry axis = machine axis Y2
N80 TANG(A, X, Y)	; Define new tangential coupling for following axis A
N90 TANGON(A, 90)	; Activate new tangential coupling for following axis A
...	

12.2 Feedrate characteristic (FNORM, FLIN, FCUB, FPO)

To permit flexible definition of the feedrate characteristic, the feedrate programming according to DIN 66025 has been extended by linear and cubic characteristics.

The cubic characteristics can be programmed either directly or as interpolating splines. These additional characteristics make it possible to program continuously smooth velocity characteristics depending on the curvature of the workpiece to be machined.

These additional characteristics make it possible to program continuously smooth velocity characteristics depending on the curvature of the workpiece to be machined.

Syntax

```
F... FNORM
F... FLIN
F... FCUB
F=FPO (... , ... , ...)
```

Meaning

FNORM:	Basic setting. The feed value is specified as a function of the traverse path of the block and is then valid as a modal value.
FLIN:	Path velocity profile linear : The feed value is approached linearly via the traverse path from the current value at the block beginning to the block end and is then valid as a modal value. The response can be combined with G93 and G94.
FCUB:	Path velocity profile cubic : The blockwise programmed F values (relative to the end of the block) are connected by a spline. The spline begins and ends tangentially with the previous and following defined feedrate and takes effect with G93 and G94. If the F address is missing from a block, the last F value to be programmed is used.
F=FPO... :	Polynomial path velocity profile: The F address defines the feed characteristic via a polynomial from the current value to the block end. The end value is valid thereafter as a modal value.

Feed optimization on curved path sections

Feed polynomial `F=FPO` and feed spline `FCUB` should always be traversed at constant cutting rate `CFC`, thereby allowing a jerk-free setpoint feed profile to be generated. This enables creation of a continuous acceleration setpoint feed profile.

Example: Various feed profiles

This example shows you the programming and graphic representation of various feed profiles.

Program code	Comment
N1 F1000 FNORM G1 X8 G91 G64	; Constant feedrate profile, incremental dimension data
N2 F2000 X7	; Setpoint velocity step change
N3 F=FPO(4000, 6000, -4000)	; Feed profile via polynomial with feed 4000 at the end of the block
N4 X6	; Polynomial feedrate 4000 is valid as modal value
N5 F3000 FLIN X5	; Linear feedrate profile
N6 F2000 X8	; Linear feedrate profile
N7 X5	; Linear feedrate is valid as modal value
N8 F1000 FNORM X5	; Constant feedrate profile with acceleration step change
N9 F1400 FCUB X8	; All of the following F values programmed in blocks are connected with splines
N10 F2200 X6	
N11 F3900 X7	
N12 F4600 X7	
N13 F4900 X5	; Switch-out spline profile
N14 FNORM X5	
N15 X20	

Further information**FNORM**

The feed address F defines the path feedrate as a constant value according to DIN 66025.

Please refer to Programming Manual "Fundamentals" for more detailed information on this subject.

**FLIN**

The feedrate characteristic is approached linearly from the current feedrate value to the programmed F value until the end of the block.

Example:

```
N30 F1400 FLIN X50
```

**FCUB**

The feedrate is approached according to a cubic characteristic from the current feedrate value to the programmed F value until the end of the block. The control uses splines to connect all

12.2 Feedrate characteristic (FNORM, FLIN, FCUB, FPO)

the feedrate values programmed non-modally that have an active FCUB. The feedrate values act here as interpolation points for calculation of the spline interpolation.

Example:

```
N50 F1400 FCUB X50
N60 F2000 X47
N70 F3800 X52
```

F=FPO(.....)

The feedrate characteristic is programmed directly via a polynomial. The polynomial coefficients are specified according to the same method used for polynomial interpolation.

Example:

```
F=FPO(endfeed, quadf, cubf)
```

endfeed, quadf and cubf are previously defined variables.

endfeed:	Feedrate at block end
quadf:	Quadratic polynomial coefficient
cubf:	Cubic polynomial coefficient

With an active FCUB, the spline is linked tangentially to the characteristic defined via FPO at the block beginning and block end.

Supplementary conditions

- The functions for programming the path traversing characteristics apply regardless of the programmed feedrate characteristic.
- The programmed feedrate characteristic is always absolute regardless of G90 or G91.
- The feed characteristic curve `FLIN` and `FCUB` does **not** act with G93 and G94 for G95, G96/G961 and G97/G971.
- With an active compressor `COMPON` the following applies when several blocks are joined to form a spline segment:

FNORM:	The F word of the last block in the group applies to the spline segment.
FLIN:	The F word of the last block in the group applies to the spline segment. The programmed F value applies until the end of the segment and is then approached linearly.
FCUB:	The generated feedrate spline deviates from the programmed end points by an amount not exceeding the value set in machine data MD20172 \$MC_COMPRESS_VELO_TOL.
F=FPO (... , ... , ...) :	These blocks are not compressed.

12.3 Acceleration behavior

12.3.1 Acceleration mode (BRISK, BRISKA, SOFT, SOFTA, DRIVE, DRIVEA)

The following part program commands are available for programming the current acceleration mode:

- "BRISK, BRISKA"
The single axes or the path axes traverse with maximum acceleration until the programmed feedrate is reached (**acceleration without jerk limitation**).
- "SOFT, SOFTA"
The single axes or the path axes traverse with constant acceleration until the programmed feedrate is reached (**acceleration with jerk limitation**).
- "DRIVE, DRIVEA"
The single axes or the path axes traverse with maximum acceleration up to a programmed velocity limit (MD setting!). The acceleration rate is then reduced (MD setting) until the programmed feedrate is reached.

Figure 12-1 Path velocity curve with BRISK and SOFT

Figure 12-2 Path velocity curve with DRIVE

Syntax

```
BRISK
BRISKA(<axis1>,<axis2>,...)
SOFT
SOFTA(<axis1>,<axis2>,...)
DRIVE
DRIVEA(<axis1>,<axis2>,...)
```

Meaning

BRISK:	Command for activating the "acceleration without jerk limitation" for the path axes.
BRISKA:	Command for activating the "acceleration without jerk limitation" for single axis movements (JOG, JOG/INC, positioning axis, oscillating axis, etc.).
SOFT:	Command for activating the "acceleration with jerk limitation" for the path axes.
SOFTA:	Command for activating the "acceleration with jerk limitation" for single axis movements (JOG, JOG/INC, positioning axis, oscillating axis, etc.).
DRIVE:	Command for activating the reduced acceleration above a configured velocity limit (MD35220 \$MA_ACCEL_REDUCTION_SPEED_POINT) for the path axes.
DRIVEA:	Command for activating the reduced acceleration above a configured velocity limit (MD35220 \$MA_ACCEL_REDUCTION_SPEED_POINT) for single axis movements (JOG, JOG/INC, positioning axis, oscillating axis, etc.).
(<axis1>,<axis2>, etc.):	Single axes for which the called acceleration mode is to apply.

Supplementary conditions

Changing acceleration mode during machining

If the acceleration mode is changed in a part program during machining (BRISK ↔ SOFT), then there is a block change with exact stop at the end of the block during the transition even with continuous-path mode.

Examples

Example 1: SOFT and BRISKA

Program code
N10 G1 X... Y... F900 SOFT
N20 BRISKA (AX5, AX6)
...

Example 2: DRIVE and DRIVEA

Program code
N05 DRIVE
N10 G1 X... Y... F1000
N20 DRIVEA (AX4, AX6)
...

12.3.2 Influence of acceleration on following axes (VELOLIMA, ACCLIMA, JERKLIMA)

In the case of axis couplings (tangential correction, coupled motion, master value coupling, electronic gear; see "Axis couplings (Page 547)").

The dynamics limits of the following axes/spindles can be manipulated using the VELOLIMA, ACCLIMA, and JERKLIMA functions from the part program or from synchronized actions, even if the axis coupling is already active.

Note

The JERKLIMA function is not available for all types of coupling.

References:

- Function Manual, Special Functions; Axis Couplings (M3)
 - Function Manual, Extended Functions; Synchronous Spindle (S3)
-

Note**Availability for SINUMERIK 828D**

The VELOLIMA, ACCLIMA and JERKLIMA functions can only be used with SINUMERIK 828D in conjunction with the "coupled motion" function!

Syntax

```
VELOLIMA (<axis>) = <value>
ACCLIMA (<axis>) = <value>
JERKLIMA (<axis>) = <value>
```

Meaning

VELOLIMA:	Command to correct the parameterized maximum velocity
ACCLIMA:	Command to correct the parameterized maximum acceleration
JERKLIMA:	Command to correct the parameterized maximum jerk
<axis>:	Following axis whose dynamics limits need to be corrected
<value>:	Percentage correction value

Examples**Example 1: Correction of the dynamics limits for a following axis (AX4)**

Program code	Comment
...	
VELOLIMA[AX4]=75	; Limit correction to 75% of the maximum axial velocity stored in the machine data
ACCLIMA[AX4]=50	; Limit correction to 50% of the maximum axial acceleration stored in the machine data
JERKLIMA[AX4]=50	; Limit correction to 50% of the maximum axial jerk stored in the machine data
...	

Example 2: Electronic gear

Axis 4 is coupled to axis X via an "electronic gear" coupling. The acceleration capacity of the following axis is limited to 70% of the maximum acceleration. The maximum permissible velocity is limited to 50% of the maximum velocity. Once the coupling has been activated successfully, the maximum permissible velocity is restored to 100%.

Program code	Comment
...	
N120 ACCLIMA[AX4]=70	; Reduced maximum acceleration.
N130 VELOLIMA[AX4]=50	; Reduced maximum velocity.
...	
N150 EGON(AX4,"FINE",X,1,2)	; Activation of the EG coupling.

Program code	Comment
...	
N200 VELOLIMA[AX4]=100	; Full maximum velocity.
...	

Example 3: Influencing master value coupling by static synchronized action

Axis 4 is coupled to X by master value coupling. The acceleration response is limited to position 80% by static synchronized action 2 from position 100.

Program code	Comment
...	
N120 IDS=2 WHENEVER \$AA_IM[AX4] >	; Synchronized action
100 DO ACCLIMA[AX4]=80	
N130 LEADON(AX4, X, 2)	; Master value coupling on
...	

12.3.3 Activation of technology-specific dynamic values (DYNNORM, DYNPOS, DYNROUGH, DYNSEMIFIN, DYNFINISH)

Using the "Technology" G group, the appropriate dynamic response can be activated for five varying technological machining steps.

Dynamic values and G commands can be configured and are, therefore, dependent on machine data settings (→ machine manufacturer).

References:

Function Manual, Basic Functions; Continuous-Path Mode, Exact Stop, Look Ahead (B1)

Syntax**Activate dynamic values:**

DYNNORM
DYNPOS
DYNROUGH
DYNSEMIFIN
DYNFINISH

Note

The dynamic values are already active in the block in which the associated G command is programmed. Machining is not stopped.

Read or write a specific field element:

R<m>=\$MA...[n,X]
\$MA...[n,X]=<value>

Meaning

DYNNORM:	G command for activating the normal dynamic response	
DYNPOS:	G command for activating the dynamic response for positioning mode, tapping	
DYNROUGH:	G command for activating the dynamic response for roughing	
DYNSEMIFIN:	G command for activating the dynamic response for finishing	
DYNFINISH:	G command for activating the dynamic response for smooth-finishing	
R<m>:	R-parameter with number <m>	
\$MA...[n,X]:	Machine data with field element affecting dynamic response	
<n>:	Array index	
	Range of values: 0 ... 4	
	0	Normal dynamic response (DYNNORM)
	1	Dynamic response for positioning mode (DYNPOS)
	2	Dynamic response for roughing (DYNROUGH)
	3	Dynamic response for finishing (DYNSEMIFIN)
	4	Dynamic response for smooth-finishing (DYNFINISH)
<X> :	Axis address	
<value>:	Dynamic value	

Examples

Example 1: Activate dynamic values

Program code	Comment
DYNNORM G1 X10	; Initial setting
DYNPOS G1 X10 Y20 Z30 F...	; Positioning mode, tapping
DYNROUGH G1 X10 Y20 Z30 F10000	;Roughing
DYNSEMIFIN G1 X10 Y20 Z30 F2000	;Finishing
DYNFINISH G1 X10 Y20 Z30 F1000	; Smooth finishing

Example 2: Read or write a specific field element

Maximum acceleration for roughing, axis X

Program code	Comment
R1=\$MA_MAX_AX_ACCEL[2,X]	; reading
\$MA_MAX_AX_ACCEL[2,X]=5	; writing

12.4 Traversing with feedforward control (FFWON, FFWOF)

The feedforward control reduces the velocity-dependent overtravel when contouring towards zero. Traversing with feedforward control permits higher path accuracy and thus improved machining results.

Syntax

FFWON

FFWOF

Meaning

FFWON:	Command to activate the feedforward control
FFWOF:	Command to deactivate the feedforward control

Note

The type of feedforward control and which path axes are to be traversed with feedforward control is specified via machine data.

Default: Velocity-dependent feedforward control

Option: Acceleration-dependent feedforward control

Example

Program code

N10 FFWON

N20 G1 X... Y... F900 SOFT

12.5 Programmable contour accuracy (CPRECON, CPRECOF)

The "Programmable contour accuracy" function reduces the path error on curved contours through automatic adaptation of the velocity.

The contour accuracy to be maintained is specified depending on the configuration of the machine (MD20470 \$MC_MC_CPREC_WITH_FFW; see machine manufacturer specifications) either via the setting data \$SC_CONTPREC or via the programmed contour tolerance CTOL. The smaller the value and the smaller the K_v factor of the geometry axes, the greater the path feedrate is reduced on curved contours.

The "Programmable contour accuracy" function is activated or deactivated via the operations CPRECON and CPRECOF in the NC program.

Syntax

```
CPRECON
...
CPRECOF
```

Meaning

CPRECON:	G command call: Switch "Programmable contour accuracy" on	
	Effective:	Modal
CPRECOF:	G command call: Switch "Programmable contour accuracy" off	
	Effective:	Modal

Together CPRECON and CPRECOF form the G function group 39 (programmable contour accuracy).

Note

The user can specify a minimum velocity for the path feedrate via the setting data \$SC_MINFEED (minimum path feedrate with CPRECON).

The feedrate is not limited below this value, unless a lower F value has been programmed or the dynamic limits of the axes require a lower path velocity.

Note

The "Programmable contour accuracy" function only considers the geometry axes of the path. It has no effect on the velocities of positioning axes.

Example

Program code	Comment
N10 G0 X0 Y0	
N20 CPRECON	; Activate the "programmable contour accuracy".

12.5 Programmable contour accuracy (CPRECON, CPRECOF)

Program code	Comment
N30 G1 G64 X100 F10000	; Machining with 10 m/min in the continuous-path mode.
N40 G3 Y20 J10	; Automatic feed limitation in circular block.
N50 G1 X0	; Feedrate again without limitation (10 m/min).
...	
N100 CPRECOF	; Deactivate the "programmable contour accuracy".
N110 G0 ...	

References

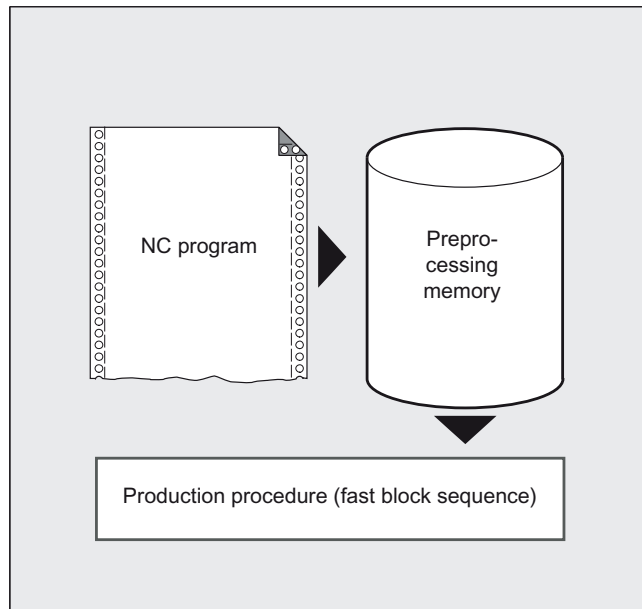

For the programming of CTOL, see "Programming contour/orientation tolerance (CTOL, OTOL, ATOL) (Page 542)"

For more detailed information on the "Programmable contour accuracy" function, see:

Function Manual, Special Functions; Contour Tunnel Monitoring (K6), Section: "Programmable contour accuracy"

12.6 Program sequence with preprocessing memory (STOPFIFO, STARTFIFO, FIFCTRL, STOPRE)

Depending on its expansion level, the control system has a certain quantity of so-called preprocessing memory in which prepared blocks are stored prior to program execution and then output as high-speed block sequences while machining is in progress. These sequences allow short paths to be traversed at a high velocity. Provided that there is sufficient residual control time available, the preprocessing memory is always filled.

Designate machining step

The beginning and end of the machining step to be buffered in the preprocessing memory are identified in the part program with "STOPFIFO" and "STARTFIFO" respectively. The processing of the preprocessed and buffered blocks starts only after the "STARTFIFO" command or if the preprocessing memory is full.

Automatic preprocessing memory control

Automatic preprocessing memory control is called with the "FIFCTRL" command. "FIFCTRL" acts initially just like "STOPFIFO". Whatever the programming, processing will not start until the preprocessing memory is full. However, the response to the emptying of the preprocessing memory does differ: With "FIFCTRL", the path velocity is reduced increasingly once the fill level reaches 2/3 in order to prevent complete emptying and deceleration to standstill.

Preprocessing stop

Programming the "STOPRE" command in a block will stop block preprocessing and buffering. The following block is not executed until all preprocessed and saved blocks have been executed in full. The preceding block is halted in exact stop (as with G9).

NOTICE
Program abort If tool offset or spline interpolations are active, a "STOPRE" command should not be programmed, as this will lead to contiguous block sequences being interrupted.

Syntax

Table 12-1 Identify machining step:

STOPFIFO
...
STARTFIFO

Table 12-2 Automatic preprocessing memory control:

...
FIFOCTRL
...

Table 12-3 Preprocessing stop:

...
STOPRE
...

Note

The "STOPFIFO", "STARTFIFO", "FIFOCTRL" and "STOPRE" commands must be programmed in their own block.

12.6 Program sequence with preprocessing memory (STOPFIFO, STARTFIFO, FIFOCTRL, STOPRE)

Meaning

STOPFIFO:	<p>"STOPFIFO" identifies the start of a machining step to be buffered in the preprocessing memory. "STOPFIFO" stops processing and fills the preprocessing memory until:</p> <ul style="list-style-type: none"> • "STARTFIFO" or "STOPRE" is recognized or • The preprocessing memory is full or • The end of the program is reached
STARTFIFO:	"STARTFIFO" starts rapid processing of the machining step; the preprocessing memory is filled in parallel to this.
FIFOCTRL:	Activation of automatic preprocessing memory control
STOPRE:	Stop preprocessing

Note

The preprocessing memory is not filled or filling is interrupted if the machining step contains commands that require unbuffered operation (search for reference, measuring functions, etc.).

Note

The control generates an internal preprocessing stop in the event of access to status data (\$SA...).

Example: Stop preprocessing

Program code	Comment
...	
N30 MEAW=1 G1 F1000 X100 Y100 Z50	; Measurement block with probe at first measuring input and linear interpolation.
N40 STOPRE	; Preprocessing stop.
...	

12.7 Defining a stop delay range (DELAYFSTON, DELAYFSTOF)

The predefined DELAYFSTON and DELAYFSTOF procedures are used to define a conditionally interruptible range in the part program (stop delay range).

Note

DELAYFSTON and DELAYFSTOF are **not** permitted in synchronized actions!

Syntax

```
DELAYFSTON
...
DELAYFSTOF
```

Meaning

DELAYFSTON:	Defining the start of a stop delay range	
	Alone in the block:	Yes
DELAYFSTOF:	Define the end of the stop delay area	
	Alone in the block:	Yes

Programming example

The following program block is repeated in a loop:

```
Program code
...
N99 MY_LOOP:
N100 G0 Z200
N200 G0 X0 Z200
N300 DELAYFSTON
N400 G33 Z5 K2 M3 S1000
N500 G33 Z0 X5 K3
N600 G0 X100
N700 DELAYFSTOF
N800 GOTOB MY_LOOP
...
```

In the following diagram it can be seen that the user pressed "Stop" in the stop delay range, and the NC started braking outside the stop delay range, i.e. in block N100. That causes the NC to stop at the beginning of N100.

12.7 Defining a stop delay range (DELAYFSTON, DELAYFSTOF)

Additional information

End of subprogram

DELAYFSTOF is activated implicitly at the end of the subprogram in which DELAYFSTON is called.

Nesting

If subprogram 1 calls subprogram 2 in a stop delay area, the whole of subprogram 2 is a stop delay area. In particular, DELAYFSTOF in subprogram 2 has no effect.

Example:

Program code	Comment
N10010 DELAYFSTON	; Blocks with N10xxx program level 1.
N10020 R1 = R1 + 1	
N10030 G4 F1	; Stop delay area starts.
...	
N10040 subprogram2	
...	
...	; Interpretation of subprogram 2.
N20010 DELAYFSTON	; Ineffective, repeated start, 2nd level.
...	
N20020 DELAYFSTOF	; Ineffective, end at another level.
N20030 RET	
N10050 DELAYFSTOF	; Stop delay end of range at the same level.
...	
N10060 R2 = R2 + 2	
N10070 G4 F1	; Stop delay area ends. From now, stops act immediately.

12.7 Defining a stop delay range (*DELAYFSTON*, *DELAYFSTOF*)

System variables

The following system variables can be queried to determine whether part program processing is currently in a stop delay area:

- in the part program with \$P_DELAYFST
- in synchronized actions with \$AC_DELAYFST

Value	Meaning
0	Delay stop range not active
1	Delay stop area active

12.8 Prevent program position for SERUPRO (IPTRLOCK, IPTRUNLOCK)

For some complicated mechanical situations on the machine it is necessary to the stop block search SERUPRO.

By using a programmable interruption pointer it is possible to intervene before an untraceable point with "Search at point of interruption".

It is also possible to define untraceable sections in part program sections that the NC cannot yet re-enter. When the program is interrupted, the NC notes the last block that was processed that can then be searched for via the HMI user interface.

Syntax

IPTRLOCK
IPTRUNLOCK

The commands are located in a part program line and allow a programmable interruption pointer

Meaning

IPTRLOCK:	Start of untraceable program section
IPTRUNLOCK:	End of untraceable program section

Both commands are only permitted in part programs, but **not** in synchronous actions.

Example

Nesting of untraceable program sections in two program levels with implicit "IPTRUNLOCK". Implicit "IPTRUNLOCK" in subprogram 1 ends the untraceable section.

Program code	Comment
N10010 IPTRLOCK()	
N10020 R1 = R1 + 1	
N10030 G4 F1	; Hold block of the search-suppressed program section starts.
...	
N10040 subprogram2	
...	; Interpretation of subprogram 2.
N20010 IPTRLOCK ()	; Ineffective, repeated start.
...	
N20020 IPTRUNLOCK ()	; Ineffective, end at another level.
N20030 RET	
...	
N10060 R2 = R2 + 2	
N10070 RET	; End of search-suppressed program section.
N100 G4 F2	; Main program is continued.

The interruption pointer then produces an interruption at 100 again.

Further information

Acquiring and finding untraceable sections

Non-searchable program sections are identified with language commands "IPTRLOCK" and "IPTRUNLOCK".

Command "IPTRLOCK" freezes the interruption pointer at a single block executable in the main run (SBL1). This block will be referred to as the hold block below. If the program is aborted after "IPTRLOCK", this hold block can be searched for from the HMI user interface.

Continuing from the current block

The interruption pointer is placed on the current block with "IPTRUNLOCK" as the interruption point for the following program section.

Once the search target is found a new search target can be repeated with the hold block.

An interrupt pointer edited by the user must be removed again via the HMI.

Rules for nesting:

The following points govern the interaction between language commands "IPTRLOCK" and "IPTRUNLOCK" with nesting and the subprogram end.

1. "IPTRLOCK" is activated implicitly at the end of the subprogram in which "IPTRUNLOCK" is called.
2. "IPTRLOCK" in a search-suppressed section has no effect.
3. If subprogram 1 calls subprogram 2 in an untraceable section, the whole of subprogram 2 remains untraceable. "IPTRUNLOCK" in particular has no effect in subprogram 2.

For more information, see

/FB1/ Function Manual, Basic Functions; Mode Group, Channel, Program Operation Mode (K1).

System variable

An untraceable section can be detected in the part program with "\$P_IPTRLOCK".

Automatic interrupt pointer

The automatic interrupt pointer automatically defines a previously defined coupling type as untraceable. The machine data for

- Electronic gear for "EGON"
- Axial master value coupling for "LEADON"

are used to activate the automatic interrupt pointer. If the programmed interrupt pointer and interrupt pointer activated with automatic interrupt pointers overlap, the largest possible untraceable section will be generated.

12.9 Repositioning to the contour (REPOSA, REPOSL, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL)

If you interrupt the program run and retract the tool during the machining operation – because, for example, the tool has broken or you wish to measure the workpiece – you can reposition at any selected point on the contour under control by the program.

The command `REPOS` acts in an ASUB as a subprogram return (e.g. M17). The following blocks are not executed. For information on interrupting program runs, see also "Interrupt routine (ASUB) (Page 125)."

Syntax

```
REPOSA RMIBL DISPR=...
REPOSA RMBBL
REPOSA RMEBL
REPOSA RMNBL
REPOSL RMIBL DISPR=...
REPOSL RMBBL
REPOSL RMEBL
REPOSL RMNBL
REPOSQ RMIBL DISPR=... DISR=...
REPOSQ RMBBL DISR=...
REPOSQ RMEBL DISR=...
REPOSQA DISR=...
REPOSH RMIBL DISPR=... DISR=...
REPOSH RMBBL DISR=...
REPOSH RMEBL DISR=...
REPOSHA DISR=...
```

Meaning**Selecting the approach path**

REPOSA:	Repositioning to the contour with the geometry axes along a straight line. All other channel axes are also repositioned.
REPOSL:	Repositioning to the contour with the geometry axes along a straight line. Other axes have to be programmed explicitly.
REPOSQ DISR=... :	Repositioning to the contour with the geometry axes along a quadrant of radius DISR. Other axes have to be programmed explicitly.
REPOSQA DISR=... :	Repositioning to the contour with the geometry axes along a quadrant of radius DISR. All other channel axes are also repositioned.
REPOSH DISR=... :	Repositioning to the contour with the geometry axes along a semicircle of diameter DISR. Other axes have to be programmed explicitly.
REPOSHA DISR=... :	Repositioning to the contour with the geometry axes along a semi-circle of radius DISR. All other channel axes are also repositioned.

Selecting the repositioning point

RMIBL:	Approach interruption point
RMIBL DISPR=...:	Entry point at distance DISPR in mm/inch in front of interruption point
RMBBL:	Approach block start point
RMEBL:	Approach end of block
RMEBL DISPR=... :	Approach block end point at distance DISPR in front of end point
RMNBL:	Approach at nearest path point
A0 B0 C0 :	Axes in which approach is to be made

Note**Compatibility**

To remain compatible with older software versions, you can still program the REPOS approach mode via the modal commands RMI, RMB, RME and RMN. When used within an ASUB, this should be allocated the attribute SAVE in the PROC statement. Otherwise the modal REPOS approach mode used in the ASUB will take effect in subsequent REPOS processes, too, if it deviates from the preset RMI.

Repositioning to the contour along a straight line, REPOSA, REPOSL

The tool approaches the repositioning point along a straight line.

Example

```
REPOSL RMIBL DISPR=6 F400
```

12.9 Repositioning to the contour (REPOSA, REPOSL, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL)

Repositioning to the contour along a quadrant, REPOSQ, REPOSQA

The tool approaches the repositioning point along a quadrant with a radius of $DISR=...$. The control automatically calculates the necessary intermediate point between the start and repositioning point.

Example

REPOSQ RMIBL DISR=10 F400

Repositioning to the contour along a semicircle, REPOSH, REPOSHA

The tool approaches the repositioning point along a semi-circle with a diameter of `DISR=...`. The control automatically calculates the necessary intermediate point between the start and repositioning point.

Example

```
REPOSH RMIBL DISR=20 F400
```

Specifying the repositioning point (not for SERUPRO approaching with RMNBL)

With reference to the NC block in which the program run has been interrupted, it is possible to select one of three different repositioning points:

- RMIBL, interruption point
- RMBBL, block start point or last end point
- RMEBL, block end point

12.9 Repositioning to the contour (REPOSA, REPOSL, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL)

RMIBL DISPR=... or RME DISPR=... allows you to select a repositioning point which lies before the interruption point or the block end point.

DISPR=... allows you to describe the contour distance in mm/inch between the repositioning point and the interruption before the end point. Even for high values, this point cannot be further away than the block start point.

If no DISPR=... command is programmed, then DISPR=0 applies and with it the interruption point (with RMIBL) or the block end point (with RMEBL).

DISPR sign

The sign of DISPR is evaluated. In the case of a plus sign, the behavior is as previously.

In the case of a minus sign, approach is behind the interruption point or, with RMBBL, behind the block start point.

The distance between interruption point and approach point depends on the value of DISPR. Even for higher values, this point can lie in the block end point at the maximum.

Application example:

A sensor will recognize the approach to a clamp. An ASUB is initiated to bypass the clamp.

Afterwards, a negative DISPR is repositioned on one point behind the clamp and the program is continued.

SERUPRO approach with RMNBL

If an abort is forced during machining at any position, the shortest path from the abort point is approached with SERUPRO approach and RMNBL so that afterward only the distance-to-go is processed. The user starts a SERUPRO process at the interruption block and uses the JOG keys to move in front of the problem component of the target block.

Note

SERUPRO

For SERUPRO, RMIBL and RMBBL are identical. RMNBL is not only limited to SERUPRO, but is generally valid.

12.9 Repositioning to the contour (REPOSA, REPOSL, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL)

Approach from the nearest path point RMNBL

When REPOSA is interpreted, the repositioning block with RMNBL is not started again in full after an interruption, but only the distance-to-go processed. The nearest path point of the interrupted block is approached.

Status for the valid REPOS mode

The valid REPOS mode of the interrupted block can be read with synchronized actions and variable \$AC_REPOS_PATH_MODE:

- 0 Approach not defined
- 1 RMBBL: Approach to beginning
- 2 RMIBL: Approach to point of interruption
- 3 RMEBL: Approach to end of block
- 4 RMNBL: Approach to next path point of the interrupted block

Approaching with a new tool

The following applies if you have stopped the program run due to tool breakage:

When the new D number is programmed, the machining program is continued with modified tool offset values at the repositioning point.

Where tool offset values have been modified, it may not be possible to reapproach the interruption point. In such cases, the point closest to the interruption point on the new contour is approached (possibly modified by DISPR).

Approach contour

The motion with which the tool is repositioned on the contour can be programmed. Enter zero for the addresses of the axes to be traversed.

The REPOSA, REPOSQA and REPOSHA commands automatically reposition all axes. Individual axis names need not be specified.

When the commands REPOSL, REPOSQ and REPOSH are programmed, all geometry axes are traversed automatically, i.e. they do not have to be specified in the command. All other axes must be specified in the commands.

The following applies to the REPOSH and REPOSQ circular motions:

The circle is traversed in the specified working planes G17 to G19.

If you specify the third geometry axis (infeed direction) in the approach block, the repositioning point is approached along a helix in case the tool position and programmed position in the infeed direction do not coincide.

12.9 Repositioning to the contour (*REPOSA, REPOSL, REPOSQ, REPOSQA, REPOSH, REPOSHA, DISR, DISPR, RMIBL, RMBBL, RMEBL, RMNBL*)

In the following cases, there is an automatic switchover to linear approach REPOSL:

- You have not specified a value for DISR.
- No defined approach direction is available (program interruption in a block without travel information).
- With an approach direction that is perpendicular to the current working plane.

12.10 Influencing the motion control

12.10.1 Percentage jerk correction (JERKLIM)

Using the NC command "JERKLIM", the maximum jerk of an axis for path motion - set using machine data - can be reduced or increased in critical program sections.

Requirement

The acceleration mode SOFT must be active.

Effectiveness

The function is effective:

- In the AUTOMATIC operating modes.
- Only on path axes.

Syntax

JERKLIM[<axis>]=<value>

Meaning

JERKLIM:	Command for jerk correction	
<axis>:	Machine axis whose jerk limit value is to be adapted.	
<value>:	Percentage correction value, referred to the configured maximum axis jerk for path motion (MD32431 \$MA_MAX_AX_JERK).	
	Range of values:	1 ... 200
	Value 100 does not influence the jerk.	

Note

The behavior of JERKLIM at the end of the part program and channel reset is configured with bit 0 in machine data MD32320 \$MA_DYN_LIMIT_RESET_MASK:

- Bit 0 = 0:
The programmed value for JERKLIM is reset to 100% with channel reset/M30.
 - Bit 0 = 1:
The programmed value for JERKLIM is retained beyond the channel reset/M30.
-

Example

Program code	Comment
...	

Program code	Comment
N60 JERKLIM[X]=75	; The axis slide in the X direction should only be accelerated/decelerated with a maximum of 75% of the jerk permissible for the axis.
...	

12.10.2 Percentage velocity correction (VELOLIM)

The maximum possible velocity of an axis or the maximum possible gear-stage-dependent speed of a spindle set via machine data can be reduced with the VELOLIM command in the part program or synchronized action.

Effectiveness

The function is effective:

- In the AUTOMATIC operating modes.
- On path and positioning axes.
- On spindles in spindle/axis operations

Syntax

VELOLIM[<axis/spindle>]=<value>

Meaning

VELOLIM:	Command for velocity correction
<axis/spindle>:	<p>Axis or spindle whose velocity or speed limit value should be adapted.</p> <p>VELOLIM for spindles</p> <p>Using machine data (MD30455 \$MA_MISC_FUNCTION_MASK, bit 6), when programming in the part program, it can be set as to whether "VELOLIM" is effective independent of whether used as spindle or axis (bit 6 = 1) - or is able to be programmed separately for each operating mode (bit 6 = 0). If they are to be separately effective, then the selection is made using the identifier when programming:</p> <ul style="list-style-type: none"> • Spindle identifier S<n> for spindle operating modes • Axis identifier, e.g. "C", for axis operation

<value>:	Percentage correction value	
	The correction value refers to:	
	<ul style="list-style-type: none"> For axes/spindles in axis operation (MD30455 bit 6 == 0): To the configured maximum axis velocity (MD32000 \$MA_MAX_AX_VELO). For spindles in spindle or axis operation (MD30455 bit 6 == 1): To the maximum speed of the active gear unit stage (MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT[<n>]) 	
	Range of values:	1 ... 100
	The value 100 does not influence the velocity or speed.	

Note**Behavior at the end of the part program and for a channel reset**

The behavior of "VELOLIM" at the end of the part program and channel reset can be set via the machine data: MD32320 \$MA_DYN_LIMIT_RESET_MASK, bit 0

Detection of an active speed limitation in spindle operation

A speed limitation via "VELOLIM" (less than 100%) can be detected in spindle operation via the following system variables:

- \$AC_SMAXVELO (maximum possible spindle speed)
- \$AC_SMAXVELO_INFO (identifier for the speed-limiting cause)

Examples**Example 1: Velocity limitation, machine axis**

Program code	Comment
...	
N70 VELOLIM[X]=80	; The axis slide in the X direction should only be traversed with a maximum of 80% of the velocity permissible for the axis.
...	

Example 2: Speed limitation, spindle

Program code	Comment
N05 VELOLIM[S1]=90	; Limiting the maximum speed of spindle 1 to 90% of 1000 rpm.
...	
N50 VELOLIM[C]=45	; Limiting the speed to 45% of 1000 rpm, C is the axis identifier of S1.
...	

Machine data settings for spindle 1 (AX5)

- Maximum speed of gear stage 1 = 1000 rpm:
MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT[1, AX5] = 1000
- Programming "VELOLIM" acts together for spindle and axis operation independent of the programmed identifier:
MD30455 \$MA_MISC_FUNCTION_MASK[AX5], bit 6 = 1

12.10.3 Program example for JERKLIM and VELOLIM

The following program presents an application example for the percentage jerk and velocity limit:

Program code	Comments
N1000 G0 X0 Y0 F10000 SOFT G64	
N1100 G1 X20 RNDM=5 ACC[X]=20 ACC[Y]=30	
N1200 G1 Y20 VELOLIM[X]=5	; The axis slide in the X direction should only be traversed with max. 5% of the velocity permissible for the axis.
JERKLIM[Y]=200	; The axis slide in the Y direction can be accelerated/decelerated with max. 200% of the jerk permissible for the axis.
N1300 G1 X0 JERKLIM[X]=2	; The axis slide in the X direction should only be accelerated/decelerated with max. 2% of the jerk permissible for the axis.
N1400 G1 Y0	
M30	

12.11 Programming contour/orientation tolerance (CTOL, OTOL, ATOL)

Addresses CTOL, OTOL and ATOL can be used to adapt the machining tolerances - parameterized using machine and setting data - for compressor functions, smoothing and orientation smoothing in the part program.

The programmed tolerance values are valid until they are reprogrammed or deleted by assigning a negative value. Further, they are deleted at the end of the program or a reset. The parameterized tolerance values become effective again after deletion.

Syntax

```
CTOL=<Value>
OTOL=<Value>
ATOL[<Axis>]=<Value>
```

Meaning

CTOL:	Address to program the contour tolerance		
	Applications:	<ul style="list-style-type: none"> All compressor functions All rounding types except G641 and G644 	
	Preprocessing stop:	No	
	Effective:	Modal	
	<Value>:	The value for the contour tolerance is specified as a length.	
		Type:	REAL
		Unit:	inch/mm (dependent on the current dimensions setting)
		Value range:	<div> <div>≥ 0:</div> <div>Tolerance value</div> </div> <div> <div>< 0:</div> <div>The programmed tolerance value is deleted ⇒ The tolerance value parameterized in the machine or setting data becomes effective again.</div> </div>
OTOL:	Address to program the orientation tolerance		
	Applications:	<ul style="list-style-type: none"> All compressor functions ORISON orientation smoothing All smoothing types except G641, G644 and OSD 	
	Preprocessing stop:	No	
	Effective:	Modal	
	<Value>:	The value for the orientation tolerance is specified as an angle.	
		Type:	REAL
		Unit:	degrees
		Value range:	<div> <div>≥ 0:</div> <div>Tolerance value</div> </div> <div> <div>< 0:</div> <div>The programmed tolerance value is deleted ⇒ The tolerance value parameterized in the machine or setting data becomes effective again.</div> </div>

12.11 Programming contour/orientation tolerance (CTOL, OTOL, ATOL)

ATOL:	Address for programming an axis-specific tolerance		
	Applications:	<ul style="list-style-type: none"> • All compressor functions • ORISON orientation smoothing • All smoothing types except G641, G644 and OSD 	
	Preprocessing stop:	No	
	Effective:	Modal	
	<Axis>:	Name of the channel axis to which the programmed tolerance will apply	
	<Value>:	The value for the axis tolerance will be specified as a length or an angle dependent on the axis type (linear or rotary axis).	
		Type:	REAL
		Unit:	For linear axes: inch/mm (dependent on the current dimensions setting)
			For rotary axes: degrees
		Value range:	≥ 0: Tolerance value
			< 0: The programmed tolerance value is deleted ⇒ The tolerance value parameterized in the machine or setting data becomes effective again.

Note

The channel-specific tolerance values programmed with CTOL and OTOL have higher priority than the axis-specific tolerance values programmed with ATOL.

Note**Scaling frames**

Scaling frames affect programmed tolerances in the same way as axis positions; in other words, the relative tolerance remains the same.

Example

Program code	Comment
COMPCAD G645 G1 F10000	; Activate COMPCAD compressor function.
X... Y... Z...	; The machine and setting data is applied here.
X... Y... Z...	
X... Y... Z...	
CTOL=0.02	; A contour tolerance of 0.02 mm is applied starting from here.
X... Y... Z...	
X... Y... Z...	
X... Y... Z...	
ASCALE X0.25 Y0.25 Z0.25	; A contour tolerance of 0.005 mm is applied starting from here.

Program code	Comment
X... Y... Z...	
X... Y... Z...	
X... Y... Z...	
CTOL=-1	; The machine and setting data is applied again starting from here.
X... Y... Z...	
X... Y... Z...	
X... Y... Z...	

System variables

Reading with preprocessing stop

Using the following system variables, the currently active tolerances can be read in the part program and synchronized action:

- **\$AC_CTOL**
Channel-specific contour tolerance effective when the actual main run block was preprocessed.
If no contour tolerance is effective, \$AC_CTOL will return the root of the sum of the squares of the tolerances of the geometry axes.
- **\$AC_OTOL**
Channel-specific orientation tolerance effective when the actual main run block was preprocessed.
If no orientation tolerance is effective, \$AC_OTOL will return the root of the sum of the squares of the tolerances of the orientation axes during active orientation transformation. Otherwise, it will return the value "-1."
- **\$AA_ATOL[<axis>]**
Axis-specific contour tolerance effective when the actual main run block was preprocessed.
If no contour tolerance is active, \$AA_ATOL[<geometry axis>] returns the contour tolerance divided by the root of the number of geometry axes.
If an orientation tolerance and an orientation transformation are active
\$AA_ATOL[<orientation axis>] will return the orientation tolerance divided by the root of the number of orientation axes.

Note

If now tolerance values have been programmed, the \$A variables are not differentiated enough to distinguish the tolerance of the individual functions.

Circumstances like this can occur if the machine data and the setting data set different tolerances for compressor functions, smoothing and orientation smoothing. The system variables then return the greatest value occurring with the functions that are currently active. For example, if a compressor function is active with an orientation tolerance of 0.1° and ORISON orientation smoothing with 1°, the \$AC_OTOL variable will return the value "1." If orientation smoothing is deactivated, \$AC_OTOL returns a value value "0.1."

Reading without preprocessing stop

Using the following system variables, the currently active tolerances can be read in the part program:

- `$P_CTOL`
Currently active channel-specific contour tolerance.
- `$P_OTOL`
Currently active channel-specific orientation tolerance.
- `$PA_ATOL`
Currently active axis-specific contour tolerance.

Supplementary conditions

The tolerances programmed with CTOL, OTOL and ATOL also affect functions that indirectly depend on these tolerances:

- Limiting the chord error in the setpoint value calculation
- The basic functions of the free-form surface mode

The following smoothing functions are **not** affected by the programming of CTOL, OTOL and ATOL:

- Smoothing the orientation with OSD
OSD does not use a tolerance, it uses a distance from the block transition.
- Smoothing with G644
G644 is not used for smoothing, it is used for optimizing tool changes and other motion not involving machining.
- Smoothing with G645
G645 virtually always behaves like G642 and, thus, uses the programmed tolerances. The tolerance value from machine data MD33120 `$MA_PATH_TRANS_POS_TOL` is only used in uniformly tangential block transitions with a jump in curvature, e.g. a tangential circle/straight line transition. The rounding path at these points may also be located outside the programmed contour, where many applications are less tolerant. Furthermore, it generally takes a small, fixed tolerance to compensate for the sort of changes in curvature which need not concern the NC programmer.

12.12 Block change behavior with active coupling (CPBC)

The CPBC command specifies the block change criterion that must be satisfied so that a block change can be executed in the part program with active coupling.

Syntax

```
CPBC[<following axis>] = <criterion>
```

Meaning

CPBC:	Block change criterion with active coupling	
<following axis>:	Axis identifier of the following axis	
<criterion>:	Block change criterion	
	Type:	STRING
	Value	Meaning: Block change is performed
	"NOC"	Irrespective of the coupling status
	"IPOSTOP"	For setpoint synchronism
	"COARSE"	For actual value synchronism "coarse"
	"FINE"	For actual value synchronism "fine"

Example

Program code

```
; Block change takes place with:
; - Coupling to following axis X2 == active
; - Setpoint synchronism == active
CPBC[X2]="IPOSTOP"
```

Axis couplings

13.1 Coupled motion (TRAILON, TRAILOF)

When a defined leading axis is moved, the coupled motion axes (= following axes) assigned to it traverse through the distances described by the leading axis, allowing for a coupling factor.

Together, the leading axis and following axis represent coupled axes.

Applications

- Traversal of an axis by means of a simulated axis. The leading axis is a simulated axis and the coupled axis a real axis. In this way, the real axis can be traversed as a function of the coupling factor.
- Two-sided machining with two coupled motion groups:
 1. leading axis Y, coupled motion axis V
 2. leading axis Z, coupled motion axis W

Syntax

```
TRAILON(<following axis>,<leading axis>,<coupling factor>)
TRAILOF(<following axis>,<leading axis>,<leading axis 2>)
TRAILOF(<following axis>)
```

Meaning

TRAILON:	Command for activating and defining a coupled axis grouping	
	Effective:	Modal
<following axis>:	Parameter 1: Axis name of trailing axis Note: A coupled-motion axis can also act as the leading axis for other coupled-motion axes. In this way, it is possible to create a range of different coupled axis groupings.	

13.1 Coupled motion (TRAILON, TRAILOF)

<leading axis>:	Parameter 2: Axis name of trailing axis
<coupling factor>:	Parameter 3: Coupling factor The coupling factor specifies the desired relationship between the paths of the coupled-motion axis and the leading axis: $\text{<coupling factor>} = \text{path of coupled-motion axis} / \text{path of leading axis}$
	Type: REAL
	Default: 1
	The input of a negative value causes the master and coupled axes to traverse in opposition. If a coupling factor is not programmed, then coupling factor 1 automatically applies.
TRAILOF:	Command for deactivating a coupled axis grouping Effective: Modal TRAILOF with 2 parameters deactivates only the coupling to the specified leading axis: $\text{TRAILOF}(\text{<following axis>}, \text{<leading axis>})$ If a coupled-motion axis has two leading axes, TRAILOF can be called with three parameters to deactivate both couplings. $\text{TRAILOF}(\text{<following axis>}, \text{<leading axis>}, \text{<leading axis 2>})$ Programming TRAILOF without specifying a leading axis produces the same result: $\text{TRAILOF}(\text{<following axis>})$

Note

Coupled axis motion is always executed in the base coordinate system (BCS).

The number of coupled axis groupings which may be simultaneously activated is limited only by the maximum possible number of combinations of axes on the machine.

Example

The workpiece is to be machined on two sides with the axis configuration shown in the diagram. To do this, you create two combinations of coupled axes.

Program code	Comment
...	
N100 TRAILON(V,Y)	; Activation of 1st coupled axis group.
N110 TRAILON(W,Z,-1)	; Activation of 2nd coupled axis grouping, Negative coupling factor: Coupled-motion axis traverses in the opposite direction from leading axis.
N120 G0 Z10	; Infeed of Z and W axes in opposite axial directions.
N130 G0 Y20	; Infeed of Y and V axes in same axis direction.
...	
N200 G1 Y22 V25 F200	; Overlaying of a dependent and independent movement of coupled motion axis V.
...	
TRAILOF(V,Y)	; Deactivation of 1st coupled axis grouping.
TRAILOF(W,Z)	; Deactivation of 2nd coupled axis grouping.

Further information

Axis types

A coupled axis grouping can consist of any desired combinations of linear and rotary axes. A simulated axis can also be defined as a leading axis.

Coupled-motion axes

Up to two leading axes can be assigned simultaneously to a trailing axis. The assignment is made in different combinations of coupled axes.

A coupled-motion axis can be programmed with the full range of available motion commands (G0, G1, G2, G3, etc.). The coupled axis not only traverses the independently defined paths, but also those derived from its leading axes on the basis of coupling factors.

Dynamics limit

The dynamics limit is dependent on the type of activation of the coupled axis grouping:

- **Activation in part program**
If activation is performed in the part program and all leading axes are active as program axes in the activated channel, the dynamic response of all coupled-motion axes is taken into account during traversing of the leading axis to avoid overloading the coupled-motion axes.
If activation is performed in the part program with leading axes that are not active as program axes in the activating channel (\$AA_TYP \neq 1), then the dynamic response of the coupled-motion axes is not taken into account during traversing of the leading axis. This can cause the overloading of coupled-motion axes with a dynamic response which is less than that required for the coupling.
- **Activation in synchronized action**
If activation is performed in a synchronized action, the dynamic response of the coupled-motion axes is not taken into account during traversing of the leading axis. This can cause the overloading of coupled-motion axes with a dynamic response which is less than that required for the coupling.

**CAUTION****Axis overload**

If a coupled axis grouping is activated:

- In synchronized actions
- In the part program with leading axes that are not program axes in the channel of the coupled-motion axes

It is the specific responsibility of the user / machine manufacturer to take suitable action to ensure that the traversing of the leading axis will not cause the overloading of the coupled-motion axes.

Coupling status

The coupling status of an axis can be checked in the part program with the system variable:

\$AA_COUP_ACT[<axis>]

Value	Meaning
0	No coupling active
8	Coupled motion active

Display of distance-to-go of the coupled-motion axis for modulo rotary axes

If the leading and coupled-motion axes are modulo rotary axes, traversing movements in the leading axis from $n \cdot 360^\circ$ with $n = 1, 2, 3 \dots$, add up in the distance-to-go display of the coupled-motion axis until the coupling is switched off.

Example: Program section with TRAILON and leading axis B and following axis C

Program code	Comment
TRAILON(C,B,1)	; Activate coupling
G0 B0	; Starting position
	; Distance-to-go display at block start:

13.1 Coupled motion (TRAILON, TRAILOF)

Program code	Comment
G91 B360	; B=360, C=360
G91 B720	; B=720, C=1080
G91 B360	; B=360, C=1440

13.2 Curve tables (CTAB)

Curve tables can be used to program position and velocity relationships between two axes (leading and following axis). Curve tables are defined in the part program.

Application

Curve tables replace mechanical cams. The curve table forms the basis for the axial master value coupling by creating the functional relationship between the leading and the following value: With appropriate programming, the control calculates a polynomial that corresponds to the cam from the relative positions of the leading and following axes.

13.2.1 Define curve tables (CTABDEF, CATBEND)

A curve table represents a part program or a section of a part program enclosed by CTABDEF at the start and CTABEND at the end.

Within this part program section, unique following axis positions are assigned to individual positions of the leading axis using motion operations; these following axis positions are used as intermediate points when calculating the curve definition in the form of a polynomial up to the 5th order.

Requirement

The MD must be configured accordingly to ensure that sufficient memory space is reserved for the definition of curve tables (→ machine manufacturer).

Syntax

```
CTABDEF(<following axis>,<leading axis>,<n>,<periodicity>[,<memory
location>])
...
CTABEND
```

Meaning

CTABDEF():	Start of curve table definition	
CTABEND:	End of curve table definition	
<following axis>:	Axis whose motion is to be calculated using the curve table	
<leading axis>:	Axis providing the master values for the calculation of the following axis motion	
<n>:	Number (ID) of curve table The number of a curve table is unique and independent of the memory location. It is not possible for there to be tables with the same number in the static and dynamic NC memory.	
<periodicity>:	Table periodicity	
	0	Table is non-periodic (table is processed only once, even for rotary axes)
	1	Table is periodic with regard to the leading axis
	2	Table is periodic with regard to leading axis and following axis

13.2 Curve tables (CTAB)

<memory location>:	Specification of memory location (optional)	
	"SRAM"	The curve table is created in the static NC memory.
	"DRAM"	The curve table is created in the dynamic NC memory.
Note: If a value is not programmed for this parameter, the default memory location set with MD20905 \$MC_CTAB_DEFAULT_MEMORY_TYPE is used.		

Note**Overwrite**

A curve table is overwritten as soon as its number (<n>) is used in another table definition. (exception: the curve table is either active in an axis coupling or locked with CTABLOCK). **No warning is output when curve tables are overwritten.**

Examples**Example 1: Program section as curve table definition**

A program section is to be used unchanged for defining a curve table. The STOPRE command for preprocessing stop can remain and is reactivated immediately as soon as the program section is no longer being used for table definition and CTABDEF and CTABEND have been removed.

Program code	Comment
...	
CTABDEF(Y,X,1,1)	; Definition of a curve table.
...	
IF NOT (\$P_CTABDEF)	
STOPRE	
ENDIF	
...	
CTABEND	

Example 2: Definition of a non-periodic curve table

Program code	Comment
N100 CTABDEF(Y,X,3,0)	; Beginning of the definition of a ;non-periodic curve table with number 3.
N110 X0 Y0	; 1st motion operation, defines the starting values and 1st intermediate point: Master value: 0, Following value: 0
N120 X20 Y0	; 2nd interpolation point: Master value: 0...20, Following value: starting value...0
N130 X100 Y6	; 3rd interpolation point: Master value: 20...100, Following value: 0...6
N140 X150 Y6	; 4th interpolation point: Master value: 100...150, Following value: 6...6
N150 X180 Y0	; 5th interpolation point: Master value: 150...180, Following value: 6...0
N200 CTABEND	; End of the definition. The curve table is generated in its internal representation as a polynomial of up to the 5th order. The calculation of the curve definition with the specified intermediate points is dependent on the modally selected interpolation type (circular, linear, spline interpolation). The part program state before starting the definition is restored.

Example 3: Definition of a periodic curve table

Definition of a periodic curve table with number 2, master value range 0 to 360, following axis motion from 0 to 45 and back to 0:

Program code	Comment
N10 DEF REAL DEPPOS	

13.2 Curve tables (CTAB)

Program code	Comment
N20 DEF REAL GRADIENT	
N30 CTABDEF(Y,X,2,1)	; Start of definition.
N40 G1 X=0 Y=0	
N50 POLY	
N60 PO[X]=(45.0)	
N70 PO[X]=(90.0) PO[Y]=(45.0,135.0,-90)	
N80 PO[X]=(270.0)	
N90 PO[X]=(315.0) PO[Y]=(0.0,-135.0,90)	
N100 PO[X]=(360.0)	
N110 CTABEND	; End of the definition.
;Test of the curve by coupling Y to X:	
N120 G1 F1000 X0	
N130 LEADON(Y,X,2)	
N140 X360	
N150 X0	
N160 LEADOF(Y,X)	
N170 DEPPPOS=CTAB(75.0,2,GRADIENT)	; Read the table function for master value 75.0.
N180 G0 X75 Y=DEPPPOS	; Positioning leading and following axes.
;After activating the coupling, no synchronization of the following axis is required.	
N190 LEADON(Y,X,2)	
N200 G1 X110 F1000	
N210 LEADOF(Y,X)	
N220 M30	

Further Information

Starting and end value of the curve table

The starting value for the beginning of the definition range of the curve table are the first associated axis positions specified (the first traverse statement) within the curve table definition. The end value of the definition range of the curve table is determined in accordance with the last traverse command.

Available language scope

Within the definition of the curve table, you have use of the entire NC language.

Note

The following entries are not permitted in curve table definitions:

- Preprocessing stop
- Jumps in the leading axis movement (e.g. on changing transformations)
- Traverse statement for the following axis only
- Reversal of the leading axis, i.e. position of the leading axis must always be unique
- CTABDEF and CTABEND statement on various program levels.

Effectiveness of modal operations

All modal statements that are made within the curve table definition are invalid when the table definition is completed. The part program in which the table definition is made is therefore before and after the table definition in the same state.

Assignments to R-parameters

Assignments to R-parameters in the table definition are reset after CTABEND.

Example:

Program code	Comment
...	
R10=5 R11=20	;R10=5
...	
CTABDEF	
G1 X=10 Y=20 F1000	
R10=R11+5	;R10=25
X=R10	
CTABEND	
...	;R10=5

Activating ASPLINE, BSPLINE, CSPLINE

If an ASPLINE, BSPLINE or CSPLINE is activated within a curve definition table CTABDEF ... CTABEND, at least a start point should be programmed before this spline activation. Immediate activation after CTABDEF should be avoided, otherwise the spline will depend on the current axis position before the curve table definition.

Example:

Program code
...
CTABDEF (Y,X,1,0)
X0 Y0
ASPLINE
X=5 Y=10

13.2 Curve tables (CTAB)

Program code

```
X10 Y40
...
CTABEND
```

Repeated use of curve tables

The functional relationship between the leading axis and the following axis calculated using the curve table will be retained under the selected table number after the end of the part program and POWER OFF if the table has been saved to the static NC memory (SRAM).

A table created in the dynamic memory (DRAM) will be deleted on POWER ON and may have to be regenerated.

Once created, the curve table can be applied to any axis combinations of leading and following axis and is independent of the axes used to create the curve table.

Overwriting curve tables

A curve table is overwritten as soon as its number is used in another table definition.

Exception: A curve table is either active in an axis coupling or locked with CTABLOCK.

Note

No warning is output when curve tables are overwritten.

Curve table definition active?

The `$P_CTABDEF` system variable can be used at any time in the part program to check whether a curve table definition is active.

Revoking the curve table definition

Once the operations relating to the curve table definition have been excluded, the part program section can be used as a real part program again.

Loading curve tables using "Execution from external source"

If curve tables are executed from an external source, the selection of the size of the reload buffer (DRAM) in MD18360 `$MN_MM_EXT_PROG_BUFFER_SIZE` has to support the simultaneous storage of the entire curve table definition in the reload buffer. If it is not, part program processing will be canceled with an alarm.

Jumps in the following axis

Depending on the setting in machine data

MD20900 `$MC_CTAB_ENABLE_NO_LEADMOTION`

, jumps in the following axis may be tolerated if a movement is missing in the leading axis.

13.2.2 Check for presence of curve table (CTABEXISTS)

The CTABEXISTS command can be used to check if a specific curve table number is present in the NC memory.

Syntax

CTABEXISTS (<n>)

Meaning

CTABEXISTS:	Checks for the presence of curve table number <n> in the static or dynamic NC memory.	
	0	Table does not exist
	1	Table exists
<n>:	Number (ID) of curve table	

13.2.3 Delete curve tables (CTABDEL)

CTABDEL can be used to delete curve tables.

Note

Curve tables that are active in an axis coupling cannot be deleted.

Syntax

CTABDEL (<n>)
 CTABDEL (<n>, <m>)
 CTABDEL (<n>, <m>, <memory location>)
 CTABDEL ()
 CTABDEL (, , <memory location>)

Meaning

CTABDEL:	Command for deleting curve tables	
<n>:	Number (ID) of the curve table to be deleted When a curve table range CTABDEL (<n>, <m>) is deleted, <n> is used to specify the number of the first curve table in the range.	
<m>:	When a curve table range CTABDEL (<n>, <m>) is deleted, <m> is used to specify the number of the last curve table in the range. <m> has to be greater than <n>.	
<memory location>:	Specification of memory location (optional) In the case of deletion without a memory location being specified, the specified curve tables are deleted in the static and the dynamic NC memory. In the case of deletion with a memory location being specified, of the specified curve tables, only those located in the specified memory location are deleted. The rest are retained.	
	"SRAM"	Deletion in the static NC memory
	"DRAM"	Deletion in the dynamic NC memory

If CTABDEL is programmed without specification of the curve table to be deleted, then **all** curve tables or all curve tables in the specified memory will be deleted:

CTABDEL () :	Deletes all curve tables in the static and the dynamic NC memory
CTABDEL (, , "SRAM") :	Deletes all curve tables in the static NC memory
CTABDEL (, , "DRAM") :	Deletes all curve tables in the dynamic NC memory

Note

If, in the case of multiple deletion with CTABDEL (<n>, <m>) or CTABDEL () , at least one of the of the curve tables to be deleted is active in a coupling, the delete command will not be executed; in other words, **none** of the addressed curve tables will be deleted.

13.2.4 Locking curve tables to prevent deletion and overwriting (CTABLOCK, CTABUNLOCK)

Locks can be set to protect curve tables against unintentional deletion and overwriting. Once a lock has been set, it can be revoked at any time.

Syntax

Lock:

```
CTABLOCK (<n>)
CTABLOCK (<n>, <m>)
CTABLOCK (<n>, <m>, <memory location>)
CTABLOCK ( )
CTABLOCK ( , , <memory location>)
```

Unlock:

```
CTABUNLOCK (<n>)
CTABUNLOCK (<n>, <m>)
CTABUNLOCK (<n>, <m>, <memory location>)
CTABUNLOCK ( )
CTABUNLOCK ( , , <memory location>)
```

Meaning

CTABLOCK:	Command for setting a lock to prevent deletion/overwriting
CTABUNLOCK:	Command for revoking a lock to prevent deletion/overwriting CTABUNLOCK unlocks the curve tables locked with CTABLOCK. Curve tables which are involved in an active coupling remain locked and cannot be deleted. The lock with CTABLOCK is unlocked as soon as the lock applied due to the active coupling is unlocked when the coupling is deactivated. This table can therefore be deleted. It is not necessary to call CTABUNLOCK again.

<n>:	Number (ID) of the curve table to be locked/unlocked When a curve table range CTABLOCK (<n>, <m>)/CTABUNLOCK (<n>, <m>) is locked/unlocked, <n> is used to specify the number of the first curve table in the range.
<m>:	When a curve table range CTABLOCK (<n>, <m>)/CTABUNLOCK (<n>, <m>) is locked/unlocked, <m> is used to specify the number of the last curve table in the range. <m> has to be greater than <n>.
<memory location>:	Specification of memory location (optional) In the case of locking/unlocking without a memory location being specified, the specified curve tables are locked/unlocked in the static and the dynamic NC memory. In the case of locking/unlocking with a memory location being specified, of the specified curve tables, only those located in the specified memory location are locked/unlocked. The rest are not locked/unlocked.
	"SRAM" Lock/unlock in the static NC memory
	"DRAM" Lock/unlock in the dynamic NC memory

If CTABLOCK/CTABUNLOCK is programmed without specification of the curve table to be locked/unlocked, then **all** curve tables or all curve tables in the specified memory will be locked/unlocked:

CTABLOCK () :	Locks all curve tables in the static and the dynamic NC memory
CTABLOCK (, , "SRAM") :	Locks all curve tables in the static NC memory
CTABLOCK (, , "DRAM") :	Locks all curve tables in the dynamic NC memory
CTABUNLOCK () :	Unlocks all curve tables in the static and dynamic NC memory
CTABUNLOCK (, , "SRAM") :	Unlocks all curve tables in the static NC memory
CTABUNLOCK (, , "DRAM") :	Unlocks all curve tables in the dynamic NC memory

13.2.5 Curve tables: Determine table properties (CTABID, CTABISLOCK, CTABMEMTYP, CTABPERIOD)

These commands can be used to poll important properties of a curve table (table number, lock state, memory location, periodicity).

Syntax

```
CTABID (<p>)
CTABID (<p>, <memory location>)
CTABISLOCK (<n>)
CTABMEMTYP (<n>)
TABPERIOD (<n>)
```

Meaning

CTABID:	Returns the table number entered as the <p>th curve table in the specified memory. Example: CTABID(1, "SRAM") returns the number of the first curve table in the static NC memory. In this context the first curve table is the curve table with the highest table number. Note: If the sequence of curve tables in the memory changes between consecutive calls of CTABID, e.g. due to the deletion of curve tables with CTABDEL, CTABID(<p>, ...) can return a different curve table with the same number <p>.	
CTABISLOCK:	Returns the lock state of curve table number <n>:	
	0	Table is not locked
	1	Table is locked by CTABLOCK
	2	Table is locked by active coupling
	3	Table is locked by CTABLOCK and active coupling
	-1	Table does not exist
CTABMEMTYP:	Returns the memory location of curve table number <n>:	
	0	Table in the static NC memory
	1	Table in the dynamic NC memory
	-1	Table does not exist
CTABPERIOD:	Returns the periodicity of curve table number <n>:	
	0	Table is not periodic
	1	Table is periodic in the leading axis
	2	Table is periodic in the leading and following axes
	-1	Table does not exist
<p>:	Entry number in memory	
<n>:	Number (ID) of curve table	
<memory location>:	Specification of memory location (optional)	
	"SRAM"	Static NC memory
	"DRAM"	Dynamic NC memory
	Note: If a value is not programmed for this parameter, the default memory location set with MD20905 \$MC_CTAB_DEFAULT_MEMORY_TYPE is used.	

13.2.6 Read curve table values (CTABTSV, CTABTEV, CTABTSP, CTABTEP, CTABSSV, CTABSEV, CTAB, CTABINV, CTABTMIN, CTABTMAX)

The following curve table values can be read in the part program:

- Following axis and leading axis values at the start and end of a curve table
- Following axis values at the start and end of a curve segment
- Following axis value for a leading axis value

- Leading axis value for a following axis value
- Following axis minimum and maximum values
 - In the entire definition range of the curve table
or
 - In a defined curve table interval

Syntax

```
CTABTSV(<n>,<gradient>[,<following axis>])
CTABTEV(<n>,<gradient>[,<following axis>])
CTABTSP(<n>,<gradient>[,<leading axis>])
CTABTEP(<n>,<gradient>[,<leading axis>])
CTABSSV(<master value>,<n>,<gradient>[,<following axis>])
CTABSEV(<master value>,<n>,<gradient>[,<following axis>])
CTAB(<master value>,<n>,<gradient>[,<following axis>,<leading axis>])
CTABINV(<following value>,<approximate
value>,<n>,<gradient>[,<following axis>,<leading axis>])
CTABTMIN(<n>[,<following axis>])
CTABTMAX(<n>[,<following axis>])
CTABTMIN(<n>,<a>,<b>[,<following axis>,<leading axis>])
CTABTMAX(<n>,<a>,<b>[,<following axis>,<leading axis>])
```

Meaning

CTABTSV:	Read following axis value at the start of curve table no. <n>
CTABTEV:	Read following axis value at the end of curve table no. <n>
CTABTSP:	Read leading axis value at the start of curve table no. <n>
CTABTEP:	Read leading axis value at the end of curve table no. <n>
CTABSSV:	Read following axis value at the start of the curve segment belonging to the specified leading axis value (<master value>)
CTABSEV:	Read following axis value at the end of the curve segment belonging to the specified leading axis value (<master value>)
CTAB:	Read following axis value for specified leading axis value (<master value>)
CTABINV:	Read leading axis value for specified following axis value (<following value>)
CTABTMIN:	Define following axis minimum value : <ul style="list-style-type: none"> • In the entire definition range of the curve table or • In a defined interval <a> ...
CTABTMAX:	Define following axis maximum value : <ul style="list-style-type: none"> • In the entire definition range of the curve table or • In a defined interval <a> ...
<n>:	Number (ID) of curve table
<gradient>:	The <gradient> parameter returns the incline of the curve table function at the calculated position.

13.2 Curve tables (CTAB)

<following axis>:	Axis whose motion is to be calculated using the curve table (optional)
<leading axis>:	Axis providing the master values for the calculation of the following axis motion (optional)
<following value>:	Following axis value for reading the associated leading axis value for CTABINV
<leading value>:	Leading axis value: <ul style="list-style-type: none"> • For reading the associated following axis value with CTAB or • For the selection of the curve segment with CTABSSV/CTABSEV
<approximate value>:	The assignment of a leading axis value to a following axis value with CTABINV must not always be unique. CTABINV requires, therefore, an approximate value for the expected leading axis value as a parameter.
<a>:	Lower limit of the master value interval with CTABTMIN/CTABTMAX
:	Upper limit of the master value interval with CTABTMIN/CTABTMAX
	Note: The master value interval <a> to always has to be within the curve table's definition range.

Examples

Example 1:

Define following axis and leading axis values at the start and end of the curve table, along with the minimum and maximum values of the following axis in the entire definition range of the curve table.

Program code	Comment

Further information**Use in synchronized actions**

All commands for reading curve table values can also be used in synchronized actions (see also the chapter titled "Motion-synchronous actions").

When using the CTABINV, CTABTMIN, and CTABTMAX commands, make sure that:

- Sufficient NC power is available at the time of execution
or
- The number of segments in the curve table is queried prior to the call, so that the table concerned can be subdivided if necessary

CTAB with non-periodic curve tables

If the specified <master value> is outside the definition range, the upper or lower limit will be output as the following value:

CTAB with periodic curve tables

If the specified `<master value>` is outside the definition range, the master value is evaluated modulo of the definition range and the corresponding following value is output:

Approximate value for CTABINV

The CTABINV command, therefore, requires an approximate value for the expected master value. CTABINV returns the leading value that is closest to the approximate value. The approximate value can be, for example, the master value from the previous interpolator clock cycle.

Incline of the curve table function

The output of the incline (<gradient>) makes it possible to calculate the velocity of the leading or following axis at the corresponding position.

Specification of the leading or following axis

The optional specification of the leading and/or following axis is important if the leading and following axes are configured in different length units.

CTABSSV, CTABSEV

The CTABSSV and CTABSEV commands are **not** suitable to query programmed segments in the following cases:

- Circles or involutes are programmed.
- Chamfer or rounding with CHF/ RND is active
- Smoothing with G643 is active
- NC block compression with COMPON/COMPCURV/COMPCAD is active

13.2.7**Curve tables: Check use of resources (CTABNO, CTABNOMEM, CTABFNO, CTABSEGID, CTABSEG, CTABFSEG, CTABMSEG, CTABPOLID, CTABPOL, CTABFPOL, CTABMPOL)**

The programmer can use these commands to obtain up-to-date information about the use of resources for curve tables, table segments, and polynomials.

Syntax

```
CTABNO
CTABNOMEM(<memory location>)
CTABFNO(<memory location>)
CTABSEGID(<n>,<memory location>)
CTABSEG(<memory location>,<segment type>)
CTABFSEG(<memory location>,<segment type>)
CTABMSEG(<memory location>,<segment type>)
CTABPOLID(<n>)
CTABPOL(<memory location>)
CTABFPOL(<memory location>)
CTABMPOL(<memory location>)
```

Meaning

CTABNO:	Determine the total number of defined curve tables (in the static and the dynamic NC memory)
CTABNOMEM:	Determine the number of defined curve tables in the specified <memory location>
CTABFNO:	Determine the number of curve tables remaining possible in the specified <memory location>

13.2 Curve tables (CTAB)

CTABSEGID:	Determine the number of curve segments of the specified <segment type> used by curve table number <n>	
CTABSEG:	Determine the number of curve segments of the specified <segment type> used in the specified <memory location>	
CTABFSEG:	Determine the number of curve segments of the specified <segment type> remaining possible in the specified <memory location>	
CTABMSEG:	Determine the maximum possible number of curve segments of the specified <segment type> in the specified <memory location>	
CTABPOLID:	Determine the number of curve polynomials used by curve table number <n>	
CTABPOL:	Determine the number of curve polynomials used in the specified <memory location>	
CTABFPOL:	Determine the number of curve polynomials remaining possible in the specified <memory location>	
CTABMPOL:	Determine the maximum possible number of curve polynomials in the specified <memory location>	
<n>:	Number (ID) of curve table	
<memory location>:	Specification of memory location (optional)	
	"SRAM"	Static NC memory
	"DRAM"	Dynamic NC memory
	Note: If a value is not programmed for this parameter, the default memory location set with MD20905 \$MC_CTAB_DEFAULT_MEMORY_TYPE is used.	
<segment type>:	Specification of segment type (optional)	
	"L"	Linear segments
	"P"	Polynomial segments
	Note: If no value is programmed for this parameter, the sum of the linear and polynomial segments is output.	

13.3 Axial master value coupling (LEADON, LEADOF)

Note

This function is not available for SINUMERIK 828D!

With the axial master value coupling, a leading and a following axis are moved in synchronism. It is possible to assign the position of the following axis via a curve table or the resulting polynomial uniquely to a position of the leading axis – simulated if necessary.

The **leading axis** is the axis which supplies the input values for the curve table. The **following axis** is the axis, which takes the positions calculated by means of the curve table.

Actual value and setpoint coupling

The following can be used as the master value, i.e. as the output values for position calculation of the following axis:

- Actual values of the leading axis position: Actual value coupling
- Setpoints of the leading axis position: Setpoint value coupling

The master value coupling always applies in the basic coordinate system.

For information on the creation of curve tables, see Section "Curve tables".

Syntax

```
LEADON(<following axis>,<leading axis>,<n>)
LEADOF(<following axis>,<leading axis>)
```

or deactivation without specifying the leading axis:

```
LEADOF(<following axis>)
```

The master value coupling can be activated/deactivated both from the part program and also during motion from synchronized actions.

Meaning

LEADON:	Activate master value coupling
LEADOF:	Deactivate master value coupling
<following axis>:	Following axis
<leading axis>:	Leading axis
<n>:	Curve table number
\$SA_LEAD_TYPE:	Switching between setpoint and actual value coupling

Deactivate master value coupling, LEADOF

When you deactivate the master value coupling, the following axis becomes a normal command axis again!

Axial master value coupling and different operating states, RESET

Depending on the setting in the machine data, the master value couplings are deactivated with RESET.

Example of master value coupling from synchronous action

In a pressing plant, an ordinary mechanical coupling between a leading axis (stanchion shaft) and axis of a transfer system comprising transfer axes and auxiliary axes is to be replaced by an electronic coupling system.

It demonstrates how a mechanical transfer system is replaced by an electronic transfer system. The coupling and decoupling processes are implemented as **static synchronized actions**.

From the leading axis LV (stanchion shaft), transfer axes and auxiliary axes are controlled as following axes that are defined via curve tables.

Following axes

X feed or longitudinal axis
 YL closing or transverse axis
 ZL lifting axis
 U roll feed, auxiliary axis
 V guide head, auxiliary axis
 W greasing, auxiliary axis

Actions

The actions that occur include, for example, the following synchronized actions:

- Activate coupling, LEADON(<following axis>,<leading axis>,<curve table number>)
- Deactivate coupling, LEADOF(<following axis>,<leading axis>)
- Set actual value, PRESETON(<axis>,<value>)
- Set marker, \$AC_MARKER[i]=<value>

13.3 Axial master value coupling (LEADON, LEADOF)

- Coupling type: real/virtual master value
- Approaching axis positions, POS[<axis>]=<value>

Conditions

Fast digital inputs, real-time variables \$AC_MARKER and position comparisons are linked using the Boolean operator AND for evaluation as conditions.

Note

In the following example, line change, indentation and **bold** type are used for the sole purpose of improving readability of the program. For the control, everything that follows a line number constitutes a single line.

N120 M30	

Description

Master value coupling requires synchronization of the leading and the following axes. This synchronization can only be achieved if the following axis is inside the tolerance range of the curve definition calculated from the curve table when the master value coupling is activated.

The tolerance range for the position of the following axis is defined via machine data MD 37200: COUPLE_POS_POL_COARSE A_LEAD_TYPE.

If the following axis is not yet at the correct position when the master value coupling is activated, the synchronization run is automatically initiated as soon as the position setpoint value calculated for the following axis is approximately the real following axis position. During the synchronization procedure the following axis is traversed in the direction that is defined by the setpoint speed of the following axis (calculated from master spindle and using the CTAB curve table).

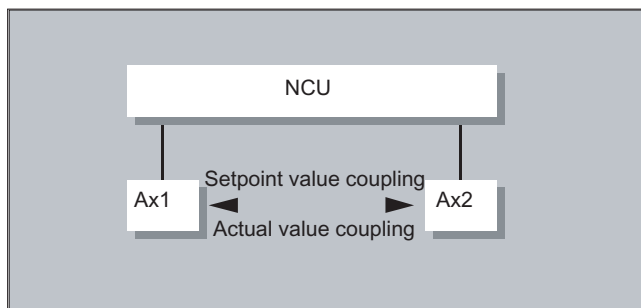

No synchronism

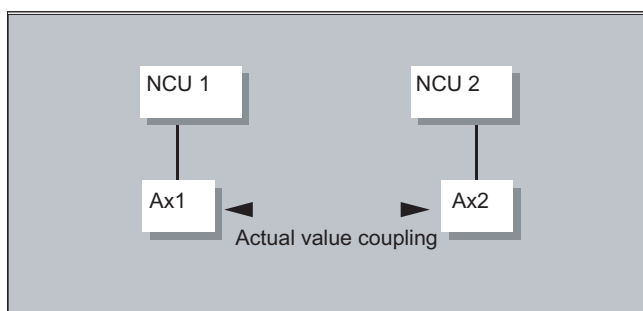

If the following axis position calculated moves away from the current following axis position when the master value coupling is activated, it is not possible to establish synchronization.

Actual value and setpoint coupling

Setpoint coupling provides better synchronization of the leading and following axis than actual value coupling and is therefore set by default.

Setpoint coupling is only possible if the leading and following axis are interpolated by the same NCU. With an external leading axis, the following axis can only be coupled to the leading axis via the actual values.

A **switchover** can be programmed via setting data \$SA_LEAD_TYPE.

You must always switch between the actual-value and setpoint coupling when the following axis stops. It is only possible to resynchronize after switchover when the axis is motionless.

Application example

You cannot read the actual values without error during large machine vibrations. If you use master value coupling in press transfer, it might be necessary to switchover from actual-value coupling to setpoint coupling in the work steps with the greatest vibrations.

Master value simulation with setpoint coupling

Via machine data, you can disconnect the interpolator for the leading axis from the servo. In this way you can generate setpoints for setpoint coupling without actually moving the leading axis.

Master values generated from a setpoint link can be read from the following variables so that they can be used, for example, in synchronized actions:

- \$AA_LEAD_P	Master value position
- \$AA_LEAD_V	Master value velocity

Create master value

As an option, master values can be generated with other self-programmed methods. The master values generated in this way are written to and read from variables

- \$AA_LEAD_SP	Master value position
- \$AA_LEAD_SV	Master value velocity

Before you use these variables, the setting data \$SA_LEAD_TYPE = 2 must be set.

Status of coupling

You can query the status of the coupling in the NC program with the following system variable:

\$AA_COUP_ACT[[axis]]

0: No coupling active

16: Master value coupling active

Status management for synchronized actions

Switching and coupling events are managed via real-time variables:

\$AC_MARKER[i] = n

managed with:

13.3 Axial master value coupling (LEADON, LEADOF)

i flag number
n status value

13.4 Electronic gear (EG)

The "Electronic gear" function allows you to control the movement of a **following axis** according to linear traversing block as a function of up to five **leading axes**. The relationship between each leading axis and the following axis is defined by the coupling factor.

The following axis motion part is calculated by an addition of the individual leading axis motion parts multiplied by their respective coupling factors. When an EG axis grouping is activated, it is possible to synchronize the following axes in relation to a defined position. A gear group can be:

- Defined
- Activated
- Deactivated
- Deleted

The following axis movement can be optionally derived from

- Setpoints of the leading axes, as well as
- Actual values of leading axes.

Non-linear relationships between each leading axis and the following axis can also be realized as extension using **curve tables** (see "Path traversing behavior" section). Electronic gears can be cascaded, i.e., the following axis of an electronic gear can be the leading axis for a further electronic gear.

13.4.1 Defining an electronic gear (EGDEF)

An EG axis group is defined by specifying the following axis and at least one, however not more than five, leading axis, each with the relevant coupling type.

Requirement

Requirements for defining an EG axis group:

It is not permissible to define an axis coupling for the following axis (or an existing one must first be deleted with EGDEL).

Syntax

```
EGDEF(following axis, leading axis1, coupling type1, leading
axis2, coupling type2, ...)
```

Meaning

EGDEF:	Definition of an electronic gear
Following axis:	Axis that is influenced by the leading axes

Leading axis1 Leading axis5	Axes that influence the following axis	
Coupling type1 Coupling type5	Coupling type The coupling type does not need to be the same for all leading axes and must be programmed separately for each individual master.	
	Value:	Meaning:
	0	The following axis is influenced by the actual value of the corresponding leading axis.
	1	The following axis is influenced by the setpoint of the corresponding leading axis.

Note

The coupling factors are preset to zero when the EG axis grouping is defined.

Note

EGDEF triggers preprocessing stop. The gearbox definition with EGDEF should also be used unaltered if, for systems, one or more leading axes affect the following axis via a **curve table**.

Example

Program code	Comment
EGDEF(C,B,1,Z,1,Y,1)	; Definition of an EG axis group. Leading axes B, Z, Y influence the following axis C via the setpoint.

13.4.2 Switch-in the electronic gearbox (EGON, EGONSYN, EGONSYNE)

There are 3 ways to switch-in an EG axis group.

Syntax**Variant 1:**

The EG axis group is selectively switched-in without synchronization with:

```
EGON(FA,"block change mode",LA1,Z1,N1,LA2,Z2,N2,...,LA5,Z5,N5)
```

Variant 2:

The EG axis group is selectively activated with synchronization with:

```
EGONSYN(FA,"block change mode",SynPosFA[,LAi,SynPosLAi,Zi,Ni])
```

Variant 3:

The EG axis group is selectively switched-in with synchronization and the approach mode specified with:

```
EGONSYNE(FA,"block change mode",SynPosFA,approach  
mode[,LAi,SynPosLAi,Zi,Ni])
```

Meaning

Variant 1:

FA	Following axis	
Block change mode:	The following modes can be used:	
	"NOC"	Block change takes place immediately
	"FINE"	Block change is performed in "Fine synchronism"
	"COARSE"	Block change is performed in "Coarse synchronism"
	"IPOSTOP"	Block change is performed for setpoint-based synchronism
LA1, ... LA5	Leading axes	
Z1, ... Z5	Numerator for coupling factor i	
N1, ... N5	Denominator for coupling factor i Coupling factor i = numerator i/denominator i	

Only the leading axes previously specified with the EGDEF command may be programmed in the activation line. At least one leading axis must be programmed.

Variant 2:

FA	Following axis	
Block change mode:	The following modes can be used:	
	"NOC"	Block change takes place immediately
	"FINE"	Block change is performed in "Fine synchronism"
	"COARSE"	Block change is performed in "Coarse synchronism"
	"IPOSTOP"	Block change is performed for setpoint-based synchronism
[, LAi, SynPosLAi, Zi, Ni]	(do not write the square brackets) Min. 1, max. 5 sequences of:	
LA1, ... LA5	Leading axes	
SynPosLAi	Synchronized position for i-th leading axis	
Z1, ... Z5	Numerator for coupling factor i	
N1, ... N5	Denominator for coupling factor i Coupling factor i = numerator i/denominator i	

Only leading axes previously specified with the EGDEF command may be programmed in the activation line. Through the programmed "Synchronized positions" for the following axis (SynPosFA) and for the leading axes (SynPosLA), positions are defined for which the axis grouping is interpreted as *synchronous*. If the electronic gear is not in the synchronized state when the grouping is switched on, the following axis traverses to its defined synchronized position.

Variant 3:

The parameters correspond to those of variant 2 plus:

Approach mode:	The following modes can be used:	
	"NTGT"	Approach next tooth gap time-optimized
	"NTGP"	Approach next tooth gap path-optimized
	"ACN"	Traverse rotary axis in negative direction absolute
	"ACP"	Traverse rotary axis in positive direction absolute
	"DCT"	Time-optimized for programmed synchronous position
	"DCP"	Distance-optimized to the programmed synchronous position

Variant 3 only affects modulo following axes that are coupled to modulo leading axes. Time optimization takes account of velocity limits of the following axis.

Further information**Description of the switch-in versions****Variant 1:**

The positions of the leading axes and following axis at the instant the grouping is switched on are stored as "Synchronized positions". The "Synchronized positions" can be read with the system variable \$AA_EG_SYN.

Variant 2:

If modulo axes are contained in the coupling group, their position values are modulo-reduced. This ensures that the next possible synchronized position is approached (so-called *relative synchronization*: e.g. the next tooth gap). The synchronized position is only approached if "Enable following axis override" interface signal DB(30 + axis number), DBX 26 bit 4 is issued for the following axis. Instead, the program stops at the EGONSYN block and self-clearing alarm 16771 is output until the above mentioned signal is set.

Variant 3:

The tooth distance (deg.) is calculated like this: $360 * Zi/Ni$. If the following axis is stopped at the time of calling, path optimization returns responds identically to time optimization.

If the following axis is already in motion, NTGP will synchronize at the next tooth gap irrespective of the current velocity of the following axis. If the following axis is already in motion, NTGT will synchronize at the next tooth gap depending on the current velocity of the following axis. The axis is also decelerated, if necessary.

Curve tables

If a **curve table** is used for one of the leading axes:

- Ni The denominator of the coupling factor for linear coupling must be set to 0. (Denominator 0 would be illegal for linear couplings.) Denominator zero tells the control that
- Zi is the number of the curve table to use. The curve table with the specified number must already be defined at POWER ON.
- LAi The leading axis specified corresponds to the one specified for coupling via coupling factor (linear coupling).

For more information about using curve tables and cascading and synchronizing electronic gears, please refer to:

References:

Function Manual Special Functions; Coupled Axes and ESR (M3), "Coupled Motion and Leading Value Coupling".

Response of the electronic gear for power on, RESET, operating mode change, block search

- No coupling is active after POWER ON.
- The status of active couplings is not affected by RESET or operating mode switchover.
- During block searches, commands for switching, deleting and defining the electronic gear are not executed or collected, but skipped.

System variables of the electronic gear

By means of the electronic gear's system variables, the part program can determine the current states of an EG axis grouping and react to them if required.

The system variables of the electronic gearbox are designated as follows:

\$AA_EG_ ...

or

\$VA_EG_ ...

References:

System Variables Manual

13.4.3 Switching-in the electronic gearbox (EGOFS, EGOFC)

There are 3 different ways to switch-out an active EG axis group.

Programming

Variant 1:

Syntax	Meaning
EGOFS (following axis)	The electronic gear is deactivated. The following axis is braked to a standstill. This call triggers a preprocessing stop.

Variant 2:

Syntax	Meaning
EGOFS (following axis, leading axis1, ..., leading axis5)	This command parameter setting made it possible to selectively remove the influence of the individual leading axes on the following axis' motion.

At least one leading axis must be specified. The influence of the specified leading axes on the slave is selectively inhibited. This call triggers a preprocessing stop. If the call still includes active leading axes, then the slave continues to operate under their influence. If the influence of all leading axes is excluded by this method, then the following axis is braked to a standstill.

Variant 3:

Syntax	Meaning
EGOFC (following spindle1)	The electronic gear is deactivated. The following spindle continues to traverse at the speed/velocity that applied at the instant of deactivation. This call triggers a preprocessing stop.

Note

This variant is only permitted for spindles.

13.4.4 Deleting the definition of an electronic gear (EGDEL)

An EG axis group must be switched-out before its definition can be deleted.

Programming

Syntax	Meaning
EGDEL (following axis)	The coupling definition of the axis group is deleted. Additional axis groups can be defined by means of EGDEF until the maximum number of simultaneously activated axis groups is reached. This call triggers a preprocessing stop.

13.4.5 Rotational feedrate (G95) / electronic gear (FPR)

The FPR command can be used to specify the following axis of an electronic gear as the axis, which determines the rotational feedrate. Please note the following with respect to this command:

- The feedrate is determined by the setpoint velocity of the following axis of the electronic gear.
- The setpoint velocity is calculated from the speeds of the leading spindles and modulo axes (which are not path axes) and from their associated coupling factors.
- Speed parts of linear or non-modulo leading axes and overlaid movement of the following axis are not taken into account.

13.5 Synchronous spindle

Synchronous operation involves a following spindle (FS) and a leading spindle (LS), referred to as the **synchronous spindle pair**. The following spindle imitates the movements of the leading spindle when a coupling is active (synchronous operation) in accordance with the defined functional interrelationship.

The synchronous spindle pairs for each machine can be assigned a fixed configuration by means of channel-specific machine data or defined for specific applications via the CNC part program. Up to two synchronized spindle pairs can be operated simultaneously on each NC channel.

Refer to the part program for the following coupling actions

- Defined or changed
- Activated
- Deactivated
- Deleted

In addition, depending on the software status

- It is possible to wait for the synchronism conditions
- The block change method can be changed
- Either the setpoint coupling or actual value coupling type is selected or the angular offset between master and following spindle specified
- When activating the coupling, previous programming of the following axis is transferred
- Either a measured or a known synchronism variance is corrected

13.5.1 Synchronous spindle: Programming (COUPDEF, COUPDEL, COUPON, COUPONC, COUPOF, COUPOFS, COUPRES, WAITC)

The "Synchronous spindle" enables the speed-synchronous traversing of the following spindle (FS) and leading spindle (LS) with a programmable transformation ratio.

The function supports the following modes:

- Speed synchronism ($n_{FS} = n_{LS}$)
- Position synchronism ($\phi_{FS} = \phi_{LS}$)
- Position synchronism with angular offset ($\phi_{FS} = \phi_{LS} + \Delta\phi$)

Application examples:

- Flying workpiece transfer, e.g. to machine the rear side, transformation ratio: 1:1

- ① Synchronize the speed
- ② Transfer the workpiece
- ③ Machine the rear side

- Multi-edge machining (polygonal turning), speed synchronism, transformation ratio: $n_1:n_2$

Syntax

```
COUPDEF(<FS>,<LS>,<ZFS>,<NLS>,<block change>,<coupling type>)
COUPON(<FS>,<LS>,<POSFS>)
COUPONC(<FS>,<LS>)
COUPOF(<FS>,<LS>,<POSFS>,<POSLS>)
COUPOFS(<FS>,<LS>)
COUPOFS(<FS>,<LS>,<POSFS>)
COUPRES(<FS>,<LS>)
COUPDEL(<FS>,<LS>)
WAITC(<FS>,<block change>,<LS>,<block change>)
```

Note**Abbreviated notation**

A shorter notation without specification of the leading spindle is possible for the COUPOF, COUPOFS, COUPRES and COUPDEL statements.

Meaning

COUPDEF:	Define/change coupling on user-specific basis
COUPON:	Activate coupling. The following spindle synchronizes to the leading spindle based on the actual speed
COUPONC:	Coupling when activating with previous programming of M3 S... or M4 S... A difference in speed for the following spindle is transferred immediately.
COUPOF:	Deactivate coupling. <ul style="list-style-type: none"> with immediate block change: COUPOF (<S2>, <S1>) Block change only after <POSFS> or <POSLS> deactivation position(s) has (have) been crossed: COUPOF (<S2>, <S1>, <POSFS>) COUPOF (<S2>, <S1>, <POSFS>, <POSLS>)
COUPOFS:	Deactivating a coupling with stop of following spindle. Block change as quickly as possible with immediate block change: COUPOFS (<S2>, <S1>) Block change only after passing the switch-off position: COUPOFS (<S2>, <S1>, <POSFS>)
COUPRES:	Reset coupling parameters to configured MD and SD
COUPDEL:	Delete user-defined coupling
WAITC:	Wait for synchronized run condition (NOC are increased to IPO during block changes)
<FS>:	Designation of following spindle
Optional parameters:	
<LS>:	Designation of main spindle Specification with spindle number: e.g. S2, S1
<ZFS>, <NLS>:	Transformation ratio between FS and LS. $\text{<ZFS>/<NLS> = numerator/denominator}$ Default setting: $\text{<ZFS> / <NLS> = 1.0}$; specification of denominator optional

<block change>:	Block change behavior	
	The block change is:	
	"NOC"	Immediately
	"FINE"	On reaching "Synchronism fine"
	"COARSE"	On reaching "Synchronism coarse"
	"IPOSTOP"	On reaching IPOSTOP; in other words, after setpoint-based synchronism (default)
The block change behavior is effective modally.		
<coupling type>:	Coupling type: Coupling between FS and LS	
	"DV"	Setpoint linkage (default)
	"AV"	Actual value coupling
	"VV"	Speed coupling
	The coupling type is modal.	
<POSFS>:	Angle offset between leading and following spindles	
	Range of values:	0°... 359.999°
<POSFS>, <POSLS>:	Switch-off positions of the following and leading spindles "The block change is enabled once POS _{FS} , POS _{LS} has been passed"	
	Range of values:	0°... 359.999°

Examples

Working with leading and following spindles

Program code	Comment
	Leading spindle = master spindle = spindle 1
	Following spindle = spindle 2
N05 M3 S3000 M2=4 S2=500	Leading spindle rotates at 3000 rpm, following spindle at 500 rpm.
N10 COUPDEF(S2,S1,1,1,"NOC","Dv")	Definition of the coupling (can also be configured).
...	
N70 SPCON	Bring leading spindle into closed-loop position control (setpoint coupling).
N75 SPCON(2)	Bring following spindle into closed-loop position control.
N80 COUPON(S2,S1,45)	On-the-fly coupling to offset position = 45 degrees.
...	
N200 FA[S2]=100	Positioning speed = 100 degrees/min
N205 SPOS[2]=IC(-90)	Traverse with 90 degrees overlay in negative direction.
N210 WAITC(S2,"Fine")	Wait for "fine" synchronism.
N212 G1 X... Y... F...	Machining
...	

Program code	Comment
N215 SPOS[2]=IC(180)	Traverse with 180 degrees overlay in the positive direction.
N220 G4 S50	Dwell time = 50 revolutions of the master spindle
N225 FA[S2]=0	Activate configured velocity (MD).
N230 SPOS[2]=IC(-7200)	20 revolutions. Move with configured velocity in the negative direction.
...	
N350 COUPOF(S2,S1)	Couple-out on-the-fly, S=S2=3000
N355 SPOSA[2]=0	Stop FS at zero degrees.
N360 G0 X0 Y0	
N365 WAITS(2)	Wait for spindle 2.

Programming a difference in speed

Program code	Comment
	Leading spindle = master spindle = spindle 1
	Following spindle = spindle 2
N01 M3 S500	Leading spindle rotates at 500 rpm.
N02 M2=3 S2=300	Following spindle rotates at 300 rpm.
...	
N10 G4 F1	Dwell time of master spindle.
N15 COUPDEF (S2,S1,-1)	Coupling factor with ratio -1:1
N20 COUPON(S2,S1)	Activate coupling. The speed of the following spindle results from the speed of the leading spindle and coupling factor.
...	
N26 M2=3 S2=100	Programming a difference in speed.

Examples of transfer of a movement for difference in speed

1. Activate coupling during previous programming of following spindle with COUPON

Program code	Comment
	Leading spindle = master spindle = spindle 1
	Following spindle = spindle 2
N05 M3 S100 M2=3 S2=200	Leading spindle rotates at 100 rpm, following spindle at 200 rpm.
N10 G4 F5	Dwell time = 5 seconds of master spindle
N15 COUPDEF(S2,S1,1)	Transformation ratio of FS to LS is 1.0 (default).
N20 COUPON(S2,S1)	On-the-fly coupling to the leading spindle.
N10 G4 F5	Following spindle rotates at 100 rpm.

2. Activate coupling during previous programming of following spindle with COUPONC

Program code	Comment
	Leading spindle = master spindle = spindle 1 Following spindle = spindle 2
N05 M3 S100 M2=3 S2=200	Leading spindle rotates at 100 rpm, following spindle at 200 rpm.
N10 G4 F5	Dwell time = 5 seconds of master spindle
N15 COUPDEF(S2,S1,1)	Transformation ratio of FS to LS is 1.0 (default).
N20 COUPONC(S2,S1)	On-the-fly coupling to leading spindle and transfer previous speed to S2.
N10 G4 F5	S2 rotates at 100 rpm + 200 rpm = 300 rpm

3. Activate coupling with following spindle stationary with COUPON

Program code	Comment
	Leading spindle = master spindle = spindle 1 Following spindle = spindle 2
N05 SPOS=10 SPOS[2]=20	Following spindle S2 in positioning mode.
N15 COUPDEF(S2,S1,1)	Transformation ratio of FS to LS is 1.0 (default).
N20 COUPON(S2,S1)	On-the-fly coupling to the leading spindle.
N10 G4 F1	Coupling is closed, S2 stops at 20 degrees.

4. Activate coupling with following spindle stationary with COUPONC

Note**Positioning or axis mode**

If the following spindle is in positioning or axis mode before coupling, then the following spindle behaves the same for COUPON (<FS>, <LS>) and COUPONC (<FS>, <LS>).

Note**Leading spindle and axis operation**

If, prior to the coupling being defined, the leading spindle is in axis operation, the velocity limit value from machine data

MD32000 \$MA_MAX_AX_VELO (maximum axis velocity) will still apply even after the coupling is activated.

To avoid this behavior, the axis must be switched to spindle mode (M3 S... or M4 S...) prior to the coupling being defined.

Further information

Configured coupling

For the configured coupling, the LS and FS are defined via machine data. The configured spindles cannot be changed in the part program. The coupling can be parameterized in the part program using `COUPDEF` (on condition that no write protection is valid).

User-defined coupling

`COUPDEF` can be used to redefine or change a coupling in the part program. If a coupling is already active, it has to be deleted first with `COUPDEL` before a new coupling is defined.

A coupling is defined in its entirety by:

```
COUPDEF(<FS>,<LS>,<TFS>,<TLS>,<block change behavior>,<coupling type>)
```

Following spindle (FS) and leading spindle (LS)

The coupling is uniquely defined using the axis names for the FS and LS. The axis names have to be programmed with every `COUPDEF` statement. The other coupling parameters are modal and only have to be programmed if they change.

Example:

```
COUPDEF(S2,S1)
```

Transformation ratio

The transformation ratio is defined as the speed ratio between FS and LS:

Following spindle / leading spindle = numerator/denominator

The numerator must be programmed. The denominator must not be programmed. The default value 1.0 is then set for the denominator.

Example:

Following spindle S2 and leading spindle S1, transformation ratio = 1/1

```
COUPDEF(S2,S1,1.0)
```

Note

The transformation ratio can also be changed on-the-fly (when the coupling is active and the spindles are rotating).

Block change behavior NOC, FINE, COARSE, IPOSTOP

The following abbreviated notation can be used when programming the block change behavior:

- "NO": Immediately (default)
- "FI": On reaching "Synchronism fine"
- "CO": On reaching "Synchronism coarse"
- "IP": On reaching IPOSTOP; i.e. after setpoint-based synchronism

Type of coupling

Note

The coupling type may only be changed when the coupling is deactivated.

Activate synchronous mode COUPON, <POSFS>

- Activation of coupling with any angular offset between LS and FS:
 - COUPON (S2, S1)
 - COUPON (S2)
- Activation of coupling with angular offset <POSFS>
<POSFS> refers to the 0° position of the leading spindle in the positive direction of rotation <POSFS> value range: 0°... 359,999°
 - COUPON (S2, S1, 30)

Note

The angular offset can also be changed when the coupling is active.

Position the following spindle

Even with activated synchronous spindle coupling, the FS can be positioned in the range $\pm 180^\circ$ independently of the LS.

- Spindle positioning of the FS with SPOS
Example: SPOS [2] = IC (-90)
Further information on SPOS can be found in:

References:

Programming Manual, Fundamentals

Differential speed

A speed difference results in speed control mode and active synchronous spindle coupling through signed overlay of an FS speed because of LS movement and an FS speed because of spindle programming:

- Synchronous spindle coupling with COUPONC
 - S<FS>=<speed> [M<FS>=<direction of rotation>]
-

Note

Supplementary conditions

- Speed S . . . must also be reprogrammed with direction of rotation M3/M4.
- Overlay of a spindle speed (M<direction of rotation> S<FS>) through the LS movement with synchronous spindle coupling COUPONC only becomes effective if the overlay has been enabled.
- The dynamic responses of the leading spindle have to be restricted to such an extent that when overlaying is applied to the following spindle, its dynamics limit values are not exceeded.

For more information about the speed difference, see:

References:

Function Manual, Extended Functions; Synchronous Spindle (S3)

Velocity, acceleration: FA, ACC, OVRA, VELOLIMA

Axial velocity and acceleration of a following spindle can be programmed with:

- FA [SPI (S<n>)] or FA [S<n>] (axial velocity)
- ACC [SPI (S<n>)] or ACC [S<n>] (axial acceleration)
- OVRA [SPI (S<n>)] and OVRA [S<n>] (axial override)
- VELOLIMA [SPI (S<n>)] and VELOLIMA [S<n>] (increase and reduction of axial velocity respectively)

When <n> = 1, 2, 3, ... (spindle numbers of the following spindles)

References:

Programming Manual, Fundamentals

Note

A reduction or increase of the maximum axial jerk has no effect with spindles.

Further information about the axial dynamic response is provided in:

References:

Function Manual, Extended Functions; Rotary Axes (R2)

Programmable block change behavior WAITC

WAITC can be used to define block change behavior, for example after a change to coupling parameters or positioning actions, with a variety of synchronism conditions (coarse, fine, IPOSTOP). If no synchronism conditions are specified, the block change behavior specified in the COUPDEF definition will apply.

Examples

- Wait for synchronism condition `FINE` to be fulfilled for following spindle `S2` and `COARSE` to be fulfilled for following spindle `S4`: `WAITC (S2, "FINE", S4, "COARSE")`
- Wait for synchronism condition according to `COUPDEF` to be fulfilled: `WAITC ()`

Deactivate coupling COUPOF

`COUPOF` can be used to define the turn-off behavior of the coupling:

- Deactivation of coupling with immediate block change:
 - `COUPOF (S2, S1)` (with specification of leading spindle)
 - `COUPOF (S2)` (without specification of leading spindle)
- Deactivation of coupling after switch-off positions have been crossed. The block change takes place after the switch-off positions have been crossed.
 - `COUPOF (S2, S1, 150)` (switch-off position FS: 150°)
 - `COUPOF (S2, S1, 150, 30)` (switch-off position FS: 150°, LS: 30°)

Deactivate coupling with following spindle stop COUPOFS

`COUPOFS` can be used to define the turn-off behavior of the coupling with following spindle stop:

- Deactivation of coupling with following spindle stop and immediate block change:
 - `COUPOFS (S2, S1)` (with specification of leading spindle)
 - `COUPOFS (S2)` (without specification of leading spindle)
- Deactivation of coupling after switch-off positions have been crossed with following spindle stop. The block change takes place after the switch-off positions have been crossed.
 - `COUPOFS (S2, S1, 150)` (switch-off position FS: 150°)

Delete couplings COUPDEL

`COUPDEL` deletes the coupling:

- `COUPDEL (S2, S1)` (with specification of leading spindle)
- `COUPDEL (S2)` (without specification of leading spindle)

Reset coupling parameters, COUPRES

`COUPRES` activates the coupling values parameterized in the machine and setting data:

- `COUPRES (S2, S1)` (with specification of leading spindle)
- `COUPRES (S2)` (without specification of leading spindle)

System variables

- Current coupling status of following spindle
The current coupling status of a following spindle can be read bit-coded via:
`<value> = $AA_COUP_ACT [<FS>]`

Bit	<value>	Meaning
-	0	No coupling active
2	4	Synchronous spindle coupling active

Note

- All other values refer to axis mode
- If the spindle is a following spindle or several couplings, then the value of the coupling state of all couplings is returned as a total state.

- Current angular offset

The current angular offset of the following spindle to the leading spindle can be read via:

- `$AA_COUP_OFFS [<FS>]` (angular offset on the setpoint side)
- `$VA_COUP_OFFS [<FS>]` (angular offset on the actual value side)

Application example

Correction of the angular offset difference in the NC program after cancelling the follow-up mode:

Angular offset difference = programmed angular offset - system variable

References

Detailed information on the system variables can be found in:

List Manual, System Variables

13.6 Generic coupling (CP...)

"Generic Coupling" is a general coupling function, combining all coupling characteristics of existing coupling types (coupled motion, master value coupling, electronic gearbox and synchronous spindle).

The function allows flexible programming:

- Users can select the coupling properties required for their applications (building block principle).
- Each coupling property can be programmed individually.
- The coupling properties of a defined coupling (e.g. coupling factor) can be changed.
- Later use of additional coupling properties is possible.
- The coordinate reference system of the following axis (base coordinate system or machine coordinate system) is programmable.
- Certain coupling properties can also be programmed with synchronous actions.

References: Function Manual, Synchronized Actions

Note

Previous coupling calls for coupled motion (TRAIL*), Master value coupling (LEAD*), Electronic Gearbox (EG*) and Synchronous spindle (COUP*) are supported via adaptive cycles.

Overview of all keywords and coupling characteristics

The following table gives an overview of all keywords of the generic coupling and the programmable coupling characteristics:

Keyword	Coupling characteristics / meaning	Syntax
CPDEF	Creation of a coupling module	CPDEF= (<FAx>)
CPDEL	Deletion of a coupling module	CPDEL= (<FAx>)
CPLA	Definition of a leading axis	CPLA [<FAx>] = (<LAX>)
CPLDEF	Definition of a leading axis and creation of a coupling module (also possible with CPDEF + CPLA)	CPLDEF [<FAx>] = (<LAX>) or CPDEF= (<FAx>) CPLA [<FAx>] = (<LAX>)
CPLDEL	Deletion of a leading axis of a coupling module (also possible with CPDEF + CPLA)	CPLDEL [<FAx>] = (<LAX>) or CPDEL= (<FAx>) CPLA [<FAx>] = (<LAX>)
CPON	Switching on a coupling module	CPON= (<FAx>)
CPOF	Switching off a coupling module	CPOF= (<FAx>)
CPLON	Switching on a leading axis of a coupling module	CPLON [<FAx>] = <LAX>

Keyword	Coupling characteristics / meaning	Syntax
CPLOF	Switching off a leading axis of a coupling module	CPLOF[<FAx>]=<LAx>
CPLNUM	Numerator of the coupling factor	CPLNUM[FAx, LAx]=<value>
CPLDEN	Denominator of the coupling factor	CPLDEN[FAx, LAx]=<value>
CPLCTID	Number of the curve table	CPLCTID[FAx, LAx]=<value>
CPLSETVAL	Coupling reference	<div>CPLSETVAL[FAx, LAx]="<coupling reference>"</div> <div> <div>"<coupling reference>":</div> <div> <div>"CMDPOS"</div>Setpoint value coupling </div> <div> <div>"CMDVEL"</div>Speed coupling </div> <div> <div>"ACTPOS"</div>Actual value coupling </div> </div>

Keyword	Coupling characteristics / meaning	Syntax
CPFMSON	Synchronization mode	CPFMSON[FAx]="<synchronization mode>"
		"<synchronization mode>":
		"CFAST" The coupling is closed time-optimized.
		"CCOARSE" The coupling is only closed when the following axis position, required according to the coupling rule, is in the range of the current following axis position.
		"NTGT" The next tooth gap is approached time-optimized.
		"NTGP" The next tooth gap is approached path-optimized.
		"NRGT" The next segment is approached in a time-optimized manner, in accordance with the ratio of the number of gears to the number of teeth.
		"NRGP" The next segment is approached in a path-optimized manner, in accordance with the ratio of the number of gears to the number of teeth.
		"ACN" For rotary axes only! The rotary axis traverses to the synchronized position in the negative axis direction. Synchronization is realized immediately.
		"ACP" For rotary axes only! The rotary axis traverses to the synchronized position in the positive axis direction. Synchronization is realized immediately.
		"DCT" For rotary axes only! The rotary axis traverses to the programmed synchronized position time-optimized. Synchronization is realized immediately.
		"DCP" For rotary axes only! The rotary axis traverses to the programmed synchronized position path-optimized. Synchronization is realized immediately.

Keyword	Coupling characteristics / meaning	Syntax		
CPFMON	Behavior of the following axis when switching on	CPFMON[FAx]= "<switch-on behavior>"		
		"<switch-on behavior>":	"STOP"	For spindles only! An active motion of the following spindle is stopped before switch-on.
			"CONT"	For spindles and main traverse axes only! The current motion of the following axis/spindle is taken over into the coupling as start motion.
			"ADD"	For spindles only! The motion components of the coupling operate in addition to the currently overlaid motion, i.e. the current motion of the following axis/spindle is retained as overlaid motion.
CPFMOF	Behavior of the following axis at complete switch-off	CPFMOF[FAx]="<switch-off behavior>"		
		"<switch-off behavior>":	"STOP"	Stop of a following axis/spindle. An active overlaid motion is also braked to standstill. The coupling is then opened
			"CONT"	For spindles and main traverse axes only! The following spindle continues to traverse at the speed/velocity that applied at the instant of deactivation.
CPFPOS + CPOF	Switch-off position of the following axis when switching off	CPOF=(FAx) CPFPOS[FAx]=<value>		

Keyword	Coupling characteristics / meaning	Syntax		
CPMRESET	Coupling behavior for RESET	CPMRESET[FAx]="<Reset behavior>"		
		"<reset behavior>":	"NONE"	The current state of the coupling is retained.
			"ON"	When the appropriate coupling module is created, the coupling is switched on. All defined leading axis relationships are activated. This is also performed when all or parts of these leading axis relationships are active, i.e. resynchronization is performed even with a completely activated coupling.
			"OF"	An active overlaid motion is also braked to standstill. The coupling is then deactivated. When the relevant coupling module was created without an explicit definition (CPDEF), the coupling module is deleted. Otherwise it is retained, i.e. it can still be used.
			"OFC"	Possible only in spindles! The following spindle continues to traverse at the speed/velocity that applied at the instant of deactivation. The coupling is switched off. When the relevant coupling module was created without an explicit definition (CPDEF), the coupling module is deleted. Otherwise it is retained, i.e. it can still be used.
			"DEL"	An active overlaid motion is also braked to standstill. The coupling is then deactivated and then deleted.
			"DELC"	Possible only in spindles! The following spindle continues to traverse at the speed/velocity that applied at the instant of deactivation. The coupling is deactivated and then deleted.

Keyword	Coupling characteristics / meaning	Syntax
CPMSTART	Coupling behavior at part program start	CPMSTART[FAx]="<start behavior>"
		"<start behavior>":
		"NONE" The current state of the coupling is retained.
		"ON" Coupling switched-on. All defined leading axis relationships are activated. This is also performed when all or parts of these leading axis relationships are active, i.e. resynchronization is performed even with a completely activated coupling.
		"OF" The coupling is switched off. When the relevant coupling module was created without an explicit definition (CPDEF), the coupling module is deleted. Otherwise it is retained, i.e. it can still be used.
		"DEL" The coupling is deactivated and then deleted.
CPMPRT	Coupling response at part program start under block search run via program test	CPMPRT[FAx]="<start behavior>"
		"<start behavior>": see CPMSTART
CPLINTR	Offset value of the input value of a leading axis	CPLINTR[FAx, LAx]=<value>
CPLINSC	Scaling factor of the input value of a leading axis	CPLINSC[FAx, LAx]=<value>
CPLOUTTR	Offset value for the output value of a coupling	CPLOUTTR[FAx, LAx]=<value>
CPLOUTSC	Scaling factor for the output value of a coupling	CPLOUTSC[FAx, LAx]=<value>
CPSYNCOF	Threshold value of position synchronism "Coarse"	CPSYNCOF[FAx]=<value>
CPSYNFIP	Threshold value of position synchronism "Fine"	CPSYNFIP[FAx]=<value>
CPSYNCOF2	Second threshold value for the "Coarse" position synchronism	CPSYNCOF2[FAx]=<value>
CPSYNFIP2	Second threshold value for the "Fine" position synchronism	CPSYNFIP2[FAx]=<value>
CPSYNCOV	Threshold value of velocity synchronism "Coarse"	CPSYNCOV[FAx]=<value>
CPSYNFIV	Threshold value of velocity synchronism "Fine"	CPSYNFIV[FAx]=<value>

Keyword	Coupling characteristics / meaning	Syntax
CPMBRAKE	Response of the following axis to certain stop signals and stop commands	CPMBRAKE[FAx]=<bit-coded value>
CPMVDI	Response of the following axis to certain NC/PLC interface signals	CPMVDI[FAx]=<bit-coded value>
CPMALARM	Suppression of special coupling-related alarm outputs	CPMALARM[FAx]=<bit-coded value>
CPSETTYPE	Coupling type	CPSETTYPE[FAx]="<coupling type>"
		"<coupling type>":
		"CP" Freely programmable
		"TRAIL" Coupling type "Coupled motion"
		"LEAD" Coupling type "Master Value Coupling"
		"EG" Coupling type "Electronic gearbox"
		"COUP" Coupling type "Synchronized spindle"

FAx: Following axis/spindle

LAX: Leading axis/spindle

Note

Coupling characteristics, which are not explicitly programmed (in part program of synchronous actions), become effective with their default settings.

Depending on the settings of the keyword CPSETTYPE instead of the default settings (CPSETTYPE="CP") preset coupling characteristics can become effective.

References

For detailed information on generic couplings, see:

- Function Manual, Special Functions; M3: Axis couplings, Chapter: "Generic coupling"

13.7 Master/slave coupling (MASLDEF, MASLDEL, MASLON, MASLOF, MASLOFS)

The "master/slave coupling" enables:

- The coupling of the slave axes to the master axis, when the axes involved are at standstill.
- The coupling/decoupling of **rotating**, speed-controlled spindles.
- The dynamic configuration.

Note

Positioning mode

For axes and spindles in the positioning mode, the coupling is only closed and opened at standstill.

Syntax

```
MASLON(<slave_1>,<slave_2>,...)
MASLOF(<slave_1>,<slave_2>,...)
MASLOFS(<slave_1>,<slave_2>,...)
```

Dynamic configuration:

```
MASLDEF(<slave_1>,<slave_2>, ... ,<master>)
MASLDEL(<slave_1>,<slave_2>,...)
```

Meaning

MASLON:	Activating a temporary master/slave coupling	
	<Slave_x>,...:	Slave axis 1 ... n
MASLOF:	Decoupling an active master/slave coupling	
	<slave_1>,...:	Slave axis 1 ... n
MASLOFS:	Decoupling a master/slave coupling and automatically braking slave spindles (see note "Coupling behavior for spindles! in speed control mode!")	
	<slave_1>,...:	Slave axis 1 ... n
MASLDEF:	Creating/changing a master/slave group from the part program	
	<slave_1>,...:	Slave axis 1 ... n
	<master>:	Master axis
MASLDEL:	Separate master/slave coupling and delete the definition of the grouping	
	<slave_1>,...:	Slave axis 1 ... n
	Note: The master/slave definitions configured in the machine data are retained.	

Note**Coupling behavior for spindles in speed control mode**

For spindles in the speed control mode, the coupling behavior of MASLON, MASLOF, MASLOFS and MASLDEL are specified explicitly via the following machine data:

MD37263 \$MA_MS_SPIND_COUPLING_MODE

For the default setting with MD37263 = 0, the slave axes are coupled-in and coupled-out only when the axes involved are at standstill. MASLOFS corresponds to MASLOF.

For MD37263 = 1, the coupling instruction is immediately executed and therefore also the motion. For MASLON the coupling is immediately closed and for MASLOFS or MASLOF immediately opened. With MASLOF, the slave spindles rotating at this instant keep their speeds until a new speed is programmed. However, with MASLOFS, they are braked automatically.

Note

For MASLOF/MASLOFS, the implicit preprocessing stop is not required. Because of the missing preprocessing stop, the \$P system variables for the slave axes do not provide updated values until next programming.

Note

For the slave axis, the actual value can be synchronized to the same value of the master axis using PRESETON. To do this, the permanent/slave coupling must be briefly switched off in order to set the actual value of the non-referenced slave axis to the value of the master/axis with POWER ON. Then the coupling is permanently re-established.

The permanent master/slave coupling is activated with the following MD setting:

MD37262 \$MA_MS_COUPLING_ALWAYS_ACTIVE = 1

It has no effect on the language commands of the temporary coupling.

Examples**Example 1: Set actual value for the slave axis of a master/slave coupling**

For a permanent master/slave coupling, PRESETON sets the actual value of the slave axis to the value of the master axis.

Program code	Comment
\$MA_MS_COUPLING_ALWAYS_ACTIVE[AX2]=0	; Deactivate the permanent coupling of the slave axis
NEWCONF	; Activate machine data change
STOPRE	
MASLOF(Y1)	; Deactivate temporary coupling
PRESETON(AX2,\$VA_IM(M_AX))	; Actual value of the slave axis = actual value of the master axis
\$MA_MS_COUPLING_ALWAYS_ACTIVE[AX2]=1	; Activate the permanent coupling of the slave axis

13.7 Master/slave coupling (MASLDEF, MASLDEL, MASLON, MASLOF, MASLOFS)

Program code	Comment
NEWCONF	; Activate machine data change

Example 2: Dynamic configuration of a master/slave coupling

To enable coupling with another spindle after axis container rotation, the previous coupling must be uncoupled, the configuration cleared, and a new coupling configured.

Figure 13-1 Prior to the axis container rotation

Figure 13-2 After axis container rotation by one slot

Program code	Comment
MASLDEF (AUX, S3)	; AUX: Slave, S3: Master = AX3
MASLON (AUX)	; Coupling on
M3=3 S3=4000	; Rotate master
MASLDEL (AUX)	; Disconnect and delete coupling
AXCTSWE (CT1)	; Enable axis container rotation
MASLDEF (AUX, S3)	; AUX: Slave, S3: Master = AX2

Synchronized actions

14.1 Definition of a synchronized action

A synchronized action is defined in a block of a part program. Any further commands that are not part of the synchronized action, may not be programmed within this block.

A synchronized action consists of the following components:

Validity, ID no. (optional)	Condition part (optional)			Action part		
	Frequency	G command (optional)	Condition	Keyword	G command (optional)	Actions
--- ¹⁾ ID=<no.> IDS=<no.>	--- ¹⁾ WHENEVER FROM WHEN EVERY	G...	Logical expres- sion	DO	G...	Action 1 ... Action n

¹⁾ Not programmed

Syntax

```
DO <action 1> ... <action n>
<frequency> [<G function>] <condition> DO <action 1> ... <action n>
ID=<No> <frequency> [<G function>] <condition> DO <action 1> ...
<action n>
IDS=<No> <frequency> [<G function>] <condition> DO <action 1> ...
<action n>
```

References

A detailed description of the functionality of synchronized actions can be found in:
Function Manual, Synchronized Actions

Oscillation

15.1 Asynchronous oscillation (OS, OSP1, OSP2, OST1, OST2, OSCTRL, OSNSC, OSE, OSB)

An oscillating axis travels back and forth between two reversal points 1 and 2 at a defined feedrate, until the oscillating motion is deactivated.

Other axes can be interpolated as desired during the oscillating motion. A continuous infeed can be achieved via a path movement or with a positioning axis, however, there is **no relationship** between the oscillating movement and the infeed movement.

Properties of asynchronized oscillation

- Asynchronous oscillation is active on an axis-specific basis beyond block limits.
- Block-oriented activation of the oscillation movement is ensured by the part program.
- Combined interpolation of several axes and superimposing of oscillation paths are not possible.

Programming

The following commands can be used to activate and control asynchronous oscillation from the part program.

The programmed values are entered in the corresponding setting data with block synchronization during the main run and remain active until changed again.

Syntax

```
OSP1[<axis>]=<value> OSP2[<axis>]=<value>
OST1[<axis>]=<value> OST2[<axis>]=<value>
FA[<axis>]=<value>
OSCTRL[<axis>]=(<setting option>,<reset option>)
OSNSC[<axis>]=<value>
OSE[<axis>]=<value>
OSB[<axis>]=<value>
OS[<axis>] = 1
OS[<axis>] = 0
```

Meaning

<axis>:	Name of oscillating axis		
OS:	Activate/deactivate oscillation		
	Value:	1	Switch oscillation on
		0	Switch oscillation off
OSP1:	Define position of reversal point 1		

15.1 Asynchronous oscillation (OS, OSP1, OSP2, OST1, OST2, OSCTRL, OSNSC, OSE, OSB)

OSP2:	Define position of reversal point 2 Note: If incremental movement is active, the position will be calculated incrementally to the last corresponding reversal position programmed in the NC program.		
OST1:	Define stopping time in reversal point 1 in [s]		
OST2:	Define stopping time in reversal point 2 in [s]		
	<value>:	-2	Interpolation continues without wait for exact stop
		-1	Wait for exact stop coarse
		0	Wait for exact stop fine
		>0	Wait for exact stop fine and then wait for specified stopping time Note: The unit for the stopping time is identical to that of the stopping time programmed with G4.
FA:	Define feedrate The feedrate is the defined feedrate of the positioning axis. If no feedrate is defined, the value stored in the machine data applies.		
OSCTRL:	Specify setting and reset options Option values 0 to 3 encrypt the behavior at the reversal points on deactivation. One of the variants from 0 to 3 can be selected. The remaining settings can be combined at will with the selected variant. Multiple options are appended with plus characters (+).		
	<value>:	0	Stop at next reversal point on deactivation of oscillation (default) Note: Only possible if values 1 and 2 are reset.
		1	When the oscillation is deactivated, stop at reversal point 1
		2	When the oscillation is deactivated, stop at reversal point 2
		3	When the oscillation is deactivated, do not approach reversal point if no spark-out strokes are programmed
		4	Approach end position after spark-out
		8	If oscillation is canceled by deletion of distance-to-go, sparking-out strokes will then need to be executed and the end position approached if necessary.
		16	If oscillation is canceled by deletion of distance-to-go, the corresponding reversal point will need to be approached as is the case with shutdown.
		32	New feed is only active after the next reversal point
		64	FA equal to 0, FA = 0: Path overlay is active FA not equal to 0, FA <> 0: Speed overlay is active
		128	For rotary axis DC (shortest path)
		256	The sparking-out stroke is a dual stroke (default). 1=Single stroke.
		512	First approach start position
OSNSC:	Define number of sparking-out strokes		

15.1 Asynchronous oscillation (OS, OSP1, OSP2, OST1, OST2, OSCTRL, OSNSC, OSE, OSB)

OSE:	Define end position (in workpiece coordinate system) to be approached after deactivation of oscillation. Note: When programming "OSE" option 4 becomes effective implicitly for "OSCTRL".
OSB:	Define start position (in workpiece coordinate system) to be approached prior to activation of oscillation. The start position is approached before reversal point 1. If the start position coincides with reversal position 1, reversal position 2 is approached next. No stopping time applies when the start position is reached, even if this position coincides with reversal position 1; instead, the axis waits for the exact stop fine signal. Any exact stop condition configured is fulfilled. Note: Bit 9 in setting data SD43770 \$SA_OSCILL_CTRL_MASK must be set to initiate an approach to the start position.

Examples

Example 1: Oscillating axis to oscillate between two reversal points

Oscillating axis Z is to oscillate between position 10 and 100. Reversal point 1 is to be approached with exact stop fine, reversal point 2 with exact stop coarse. The feedrate for the oscillating axis must be 250. 3 sparking-out strokes must be executed at the end of the machining operation and the oscillating must approach end position 200. The feedrate for the infeed axis must be 1 and the end of infeed in the X direction should be reached at position 15.

Program code	Comment
WAITP(X,Y,Z)	; Initial setting.
G0 X100 Y100 Z100	; Switch over to positioning axis operation.
WAITP(X,Z)	
OSP1[Z]=10 OSP2[Z]=100	; Reversal point 1, reversal point 2.
OSE[Z]=200	; End position.

POS[X]=15	; Starting position X axis.
POS[X]=50	; End position X axis.
OS[Z]=0	; Stop oscillation.
M30	

Note

The "OSP1[Z]=..." to "OSNCS[Z]=..." command sequence can also be programmed in a block.

Example 2: Oscillation with online modification of the reversal position

The setting data necessary for asynchronous oscillation can be set in the part program.

If the setting data is described directly in the program, the change takes effect during preprocessing. A synchronized response can be achieved by means of a preprocessing stop (STOPRE).

M30	

Further information**Oscillating axis**

The following apply to the oscillating axis:

- Every axis may be used as an oscillation axis.
- Several oscillation axes can be active at the same time (maximum: the number of the positioning axes).
- Linear interpolation G1 is always active for the oscillating axis – irrespective of the G command currently valid in the program.

The oscillating axis can:

- Act as an input axis for dynamic transformation
- Act as a guide axis for gantry and coupled-motion axes
- Be traversed:
 - Without jerk limitation "BRISK"
 - or
 - With jerk limitation "SOFT"
 - or
 - With acceleration curve with a knee (as positioning axes)

15.1 Asynchronous oscillation (OS, OSP1, OSP2, OST1, OST2, OSCTRL, OSNSC, OSE, OSB)
Oscillation reversal points

The current offsets must be taken into account when oscillation positions are defined:

- Absolute specification
"OSP1[Z]=<value>"
Position of reversal point = sum of offsets + programmed value
- Relative specification
"OSP1[Z]=IC(<value>)"
Position of reversal point = reversal point 1 + programmed value

Example:

Program code
N10 OSP1[Z]=100 OSP2[Z]=110
...
N40 OSP1[Z]=IC(3)

WAITP

If oscillation is to be performed with a geometry axis, you must enable this axis for oscillation with "WAITP".

When oscillation has finished, "WAITP" is used to enter the oscillating axis as a positioning axis again, so that normal use can resume.

Oscillation with motion-synchronous actions and stopping times

Once the set stop times have expired, the internal block change is executed during oscillation (indicated by the new distances to go of the axes). The deactivation function is checked when the block changes. The deactivation function is defined according to the control setting for the motion sequence (OSCTRL). *This dynamic response can be influenced by the feed override.*

An oscillation stroke may then be executed before the sparking-out strokes are started or the end position approached. *Although it appears as if the deactivation response has changed, this is not in fact the case.*

15.2 Oscillation controlled by synchronized actions (OSCILL)

With this mode of oscillation, an infeed motion may only be executed at the reversal points or within defined reversal areas.

Depending on requirements, the oscillation movement can be

- Continued or
- Stopped until the infeed has finished executing.

Syntax

1. Define parameters for oscillation
2. Define motion-synchronous actions
3. Assign axes, define infeed

Meaning

OSP1[<oscillating axis>]=	Position of reversal point 1
OSP2[<oscillating axis>]=	Position of reversal point 2
OST1[<oscillating axis>]=	Stopping time at reversal point 1 in seconds
OST2[<oscillating axis>]=	Stopping time at reversal point 2 in seconds
FA[<oscillating axis>]=	Feed for oscillating axis
OSCTRL[<oscillating axis>]=	Set or reset options
OSNSC[<oscillating axis>]=	Number of sparking-out strokes
OSE[<oscillating axis>]=	End position
WAITP(<oscillating axis>)	Enable axis for oscillation

Axis assignment, infeed

OSCILL[<oscillating axis>]=(<infeed axis 1>,<infeed axis 2>,<infeed axis 3>)

POSP[<infeed axis>]=(<end position>,<partial length>,<mode>)

OSCILL:	Assign infeed axis or axes for oscillating axis
POSP:	Define complete and partial infeeds (see Section "File and Program Management")
End position:	End position for the infeed axis after all partial infeeds have been traversed.
Partial length:	Length of the partial infeed at reversal point/reversal area
Mode:	Division of the complete infeed into partial infeeds = Two residual steps of equal size (default); = All partial infeeds of equal size

Motion-synchronous actions

WHEN... .. DO	when..., do...
WHENEVER ... DO	whenever..., do...

Example

No infeed must take place at reversal point 1. At reversal point 2, the infeed is to start at a distance of `ii2` before reversal point 2 and the oscillating axis is not to wait at the reversal point for the end of the partial infeed. Axis Z is the oscillation axis and axis X the infeed axis.

1. Parameters for oscillation

Program code	Comment
DEF INT ii2	; Define variable for reversal area 2
OSP1[Z]=10 OSP2[Z]=60	; Define reversal points 1 and 2
OST1[Z]=0 OST2[Z]=0	; Reversal point 1: Exact stop fine Reversal point 2: Exact stop fine
FA[Z]=150 FA[X]=0.5	; Oscillating axis Z feedrate, infeed axis X feedrate
OSCTRL[Z]=(2+8+16.1)	; Deactivate oscillating motion at reversal point 2; after delete DTG spark-out and approach end position; after delete DTG approach reversal position
OSNC[Z]=3	; Sparking-out strokes
OSE[Z]=70	; End position = 70
ii2=2	; Set reversal point range
WAITP(Z)	; Enable oscillation for Z axis

2. Synchronized action

Program code	Comment
WHENEVER \$AA_IM[Z]<\$SA_OSCILL_REVERSE_POS2[Z] DO -> \$AA_OVR[X]=0 \$AC_MARKER[0]=0	; If the actual position of oscillating axis Z in MCS is less than the start of reversal range 2, then always set the axial override of the infeed axis X to 0% and the bit memory with index 0 to the value 0.

15.2 Oscillation controlled by synchronized actions (OSCILL)

Program code	Comment
WHENEVER \$AA_IM[Z]>=\$SA_OSCILL_REVERSE_POS2[Z] DO \$AA_OVR[Z]=0	; If the actual position of the oscillating axis Z in MCS is greater than the reversal position 2, then always set the axial override of the oscillating axis Z to 0%.
WHENEVER \$AA_DTEPW[X] == 0 DO \$AC_MARKER[0]=1	; If the remaining distance to go of the partial infeed is 0, then always set the bit memory with index 0 to the value 1.
WHENEVER \$AC_MARKER[0]==1 DO \$AA_OVR[X]=0 \$AA_OVR[Z]=100	; Whenever the bit memory with index 0 is equal to 1, then set the axial override of the infeed axis X to 0%. As a consequence, a premature infeed is prevented (oscillating axis Z has still not left reversal area 2, but infeed axis X is ready for a new infeed). Set the axial override of oscillating axis Z from 0% (action of the 2nd synchronized action) back to 100% to move.

-> must be programmed in a single block

3. Start oscillation

Program code	Comment
OSCILL[Z]=(X) POSP[X]=(5,1,1)	; Start the axes Oscillating axis Z is assigned axis X as infeed axis. Up to end position 5, axis X should travel in steps of 1.
M30	; End of program

Further information

1. Define oscillation parameters

The parameters for oscillation should be defined before the movement block containing the assignment of infeed and oscillating axes and the infeed definition (see "Asynchronized oscillation").

2. Define motion-synchronized actions

The following synchronization conditions can be defined:

Suppress infeed until the oscillating axis is located within a reversal area (ii1, ii2) or at a reversal point (U1, U2).

Stop oscillation motion during infeed at reversal point.

Restart oscillation movement on completion of partial infeed. Define **start of next partial infeed**.

3. Assign oscillating and infeed axes as well as partial and complete infeed.

Define oscillation parameters

Assignment of oscillating and infeed axes: OSCILL

OSCILL[<oscillating axis>]=(<infeed axis1>,<infeed axis2>,<infeed axis3>)

The axis assignments and the start of the oscillation movement are defined with the "OSCILL" command.

Up to 3 infeed axes can be assigned to an oscillating axis.

Note

Before oscillation starts, the synchronization conditions must be defined for the behavior of the axes.

Define infeeds: POSP

POSP[<infeed axis>]=(<end position>,<partial length>,<mode>)

The following are declared to the control with the "POSP" command:

- Complete infeed (with reference to end position)
- The length of the partial infeed at the reversal point or in the reversal area
- The partial infeed response when the end position is reached (with reference to mode)

Mode = 0	The distance-to-go to the destination point for the last two partial infeeds is divided into two equal steps (default setting).
Mode = 1	All partial infeeds are of equal size. They are calculated from the complete infeed.

Define motion-synchronized actions

The synchronized-motion actions listed below are used for general oscillation.

You are given example solutions for individual tasks, which you can use as modules for creating user-specific oscillation movements

Note

In individual cases, the synchronization conditions can be programmed differentially.

Keywords

WHEN ... DO ...	when..., do...
WHENEVER ... DO	whenever..., do...

Functions

You can implement the following functions with the language resources described in detail below:

1. Infeed at reversal point.
2. Infeed at reversal area.
3. Infeed at both reversal points.
4. Stop oscillation movement at reversal point.
5. Restart oscillation movement.
6. Do not start partial infeed too early.

The following assumptions are made for all examples of synchronized actions presented here:

- Reversal point 1 < reversal point 2
- Z = oscillating axis
- X = infeed axis

Note

For more details, see the "Motion-synchronous actions" section.

Assign oscillating and infeed axes as well as partial and complete infeed**Infeed in reversal point range**

The infeed motion must start within a reversal area before the reversal point is reached.

These synchronized actions inhibit the infeed movement until the oscillating axis is within the reversal area.

The following instructions are used subject to the above assumptions:

Reversal range 1:

```
WHENEVER $AA_IM[Z]>$SA_OSCILL_RESERVE_POS1[Z]+ii1 DO $AA_OVR[X] = 0
```

Whenever the actual position of the oscillating axis in the MCS is greater than the start of reversal range 1, then set the axial override of the infeed axis to 0%.

Reversal range 2:

```
WHENEVER $AA_IM[Z]<$SA_OSCILL_RESERVE_POS2[Z]+ii2 DO $AA_OVR[X] = 0
```

Whenever the actual position of the oscillating axis in the MCS is less than the start of reversal range 2, then set the axial override of the infeed axis to 0%.

Infeed at reversal point

As long as the oscillation axis has not reached the reversal point, the infeed axis does not move.

15.2 Oscillation controlled by synchronized actions (OSCILL)

The following instructions are used subject to the above assumptions:

Reversal range 1:

```
WHENEVER $AA_IM[Z]<>$SA_OSCILL_RESERVE_POS1[Z] DO $AA_OVR[X]=0
$AA_OVR[Z]=100
```

Whenever the actual position of oscillating axis Z in MCS is greater or less than the position reversal point 1, then set the axial override of the infeed axis X to 0% and the axial override of the oscillating axis Z to 100%.

Reversal range 2:

For reversal point 2:

```
WHENEVER $AA_IM[Z]<>$SA_OSCILL_RESERVE_POS2[Z] DO $AA_OVR[X]=0
$AA_OVR[Z]=100
```

Whenever the actual position of oscillating axis Z in MCS is greater or less than the position reversal point 2, then set the axial override of the infeed axis X to 0% and the axial override of the oscillating axis Z to 100%.

Stop oscillation movement at the reversal point

The oscillation axis is stopped at the reversal point, the infeed motion starts at the same time. The oscillating motion is continued when the infeed movement is complete.

At the same time, this synchronized action can be used to start the infeed movement if this has been stopped by a previous synchronized action, which is still active.

The following instructions are used subject to the above assumptions:

Reversal range 1:

```
WHENEVER $SA_IM[Z]==$SA_OSCILL_RESERVE_POS1[Z] DO $AA_OVR[X]=0
$AA_OVR[Z]=100
```

Whenever the actual position of the oscillating axis in the MCS is the same as the reversal position 1, then set the axial override of the oscillating axis to 0% and the axial override of the infeed axis to 100%.

Reversal range 2:

```
WHENEVER $SA_IM[Z]==$SA_OSCILL_RESERVE_POS2[Z] DO $AA_OVR[X]=0
$AA_OVR[Z]=100
```

Whenever the actual position of the oscillating axis Z in the MCS is the same as the reversal position 2, then set the axial override of the oscillating axis X to 0% and the axial override of the infeed axis to 100%.

Online evaluation of reversal point

If there is a main run variable coded with \$\$ on the right of the comparison, then the two variables are evaluated and compared with one another continuously in the IPO cycle.

Note

Please refer to Section "Motion-synchronized actions" for more information.

Oscillation movement restarting

The purpose of this synchronized action is to continue the movement of the oscillation axis on completion of the part infeed movement.

The following instructions are used subject to the above assumptions:

```
WHENEVER $AA_DTEPW[X]==0 DO $AA_OVR[Z]= 100
```

Whenever the remaining distance for the partial infeed of infeed axis X in the WCS is equal to zero, then set the axial override of the oscillating axis to 100%.

Next partial infeed

When infeed is complete, a premature start of the next partial infeed must be inhibited.

A channel-specific marker (\$AC_MARKER[Index]) is used for this purpose. It is enabled at the end of the partial infeed (partial distance-to-go \equiv 0) and deleted when the axis leaves the reversal area. The next infeed movement is then prevented by a synchronized action.

On the basis of the given assumptions, the following instructions apply for reversal point 1:

1. Set marker:

```
WHENEVER $AA_DTEPW[X] == 0 DO $AC_MARKER[1]=1
```

Whenever the remaining distance for the partial infeed of infeed axis X in the WCS is equal to zero, then set the bit memory with index 1 to 1.

2. Delete marker

```
WHENEVER $AA_IM[Z]<> $SA_OSCILL_RESERVE_POS1[Z] DO $AC_MARKER[1] = 0
```

Whenever the actual position of oscillating axis Z in the MCS is greater or less than the position of reversal point 1, then set the bit memory 1 to 0.

3. Inhibit infeed

```
WHENEVER $AC_MARKER[1]==1 DO $AA_OVR[X]=0
```

Whenever bit memory 1 is the same, then set the axial override of the infeed axis X to 0%.

Punching and nibbling

16.1 Activation/deactivation

16.1.1 Activate/deactivate punching and nibbling (SPOF, SON, PON, SONS, PONS, PDELAYON, PDELAYOF, PUNCHACC)

Activate/deactivate punching and nibbling

PON and SON are used to activate the punching and nibble functions. SPOF terminates all punching- and nibble-specific functions. Modal commands PON and SON are mutually exclusive, i.e. PON deactivates SON and vice versa.

Punching/nibbling with leader

The functions SONS and PONS also switch-in the punching or nibbling functions.

Unlike SON/PON (stroke control at interpolation level), with these functions, signal-related control of stroke initiation is at servo level. This enables higher stroke frequencies and, as a result, increased punching capacity to be achieved.

While signals are being evaluated in the leader, all functions that cause the nibbling or punching axes to change position (e.g. manual handwheel travel, changes to frames via PLC, measurement functions) are inhibited.

Punching with delay

PDELAYON results in a delayed output of the punching stroke. The modally effective command has a preparatory function and therefore is generally located before PON. Normal punching resumes after PDELAYOF.

Note

The delay time is set in setting data SD42400 \$SC_PUNCH_DWELLTIME.

Path-dependent acceleration

PUNCHACC can be used to specify an acceleration characteristic defining different rates of acceleration dependent on the hole spacing.

Second punching interface

Machines which need to use a second punching interface (second punching unit or comparable medium) alternately can be switched over to a second pair of fast digital inputs and outputs on the control (I/O pair). Full punching/nibbling functionality is available on both interfaces. The

SPIF1 and SPIF2 commands are used to switch over between the first and second punching interface.

Note

Requirement: A second I/O pair has to be defined for the punching functionality in the machine data (→ see machine manufacturer's specifications).

Syntax

```
PON G... X... Y... Z...
SON G... X... Y... Z...
SONS G... X... Y... Z...
PONS G... X... Y... Z...
PDELAYON
PDELAYOF
PUNCHACC (<Smin>, <Amin>, <Smax>, <Amax>)
SPIF1/SPIF2
SPOF
```

Meaning

PON:	Activate punching.	
SON:	Activate nibbling	
PONS:	Activate punching with leader.	
SONS:	Activate nibbling with leader.	
SPOF:	Deactivate punching/nibbling.	
PDELAYON:	Activate punching with delay.	
PDELAYOF:	Deactivate punching with delay.	
PUNCHACC:	Activate travel-dependent acceleration.	
	Parameter:	
	<Smin>	Minimum hole spacing
	<Amin>	Initial acceleration <Amin> can be greater than <Amax>.
	<Smax>	Maximum hole spacing
SPIF1:	<Amax>	Final acceleration <Amax> can be greater than <Amin>.
	Activate first punching interface. The stroke is controlled using the first pair of fast I/O.	
SPIF2:	Activate second punching interface. The stroke is controlled using the second pair of fast I/O.	
	Note: The first punch interface is always active after a RESET or control system power up. If only one punching interface is used, then it need not be programmed.	

Examples

Example 1: Activate nibbling

Program code	Comment
...	
N70 X50 SPOF	; Position without punch initiation.
N80 X100 SON	; Activate nibbling, initiate a stroke before the motion (X=50) and on completion of the programmed movement (X=100).
...	

Example 2: Punching with delay

Program code	Comment
...	
N170 PDELAYON X100 SPOF	; Position without punch initiation, activate delayed punch initiation.
N180 X800 PON	; Activate punching. The punch stroke is output with a delay when the end position is reached.
N190 PDELAYOF X700	; Deactivate punching with delay, normal punch initiation on completion of the programmed movement.
...	

Example 3: Punching with two punching interfaces

Program code	Comment
...	
N170 SPIF1 X100 PON	; At the end of the block, a stroke is initiated at the first fast output. The "Stroke active" signal is monitored at the first input.
N180 X800 SPIF2	; The second stroke is initiated at the second fast output. The "Stroke active" signal is monitored at the second input.
N190 SPIF1 X700	; All further strokes are controlled with the first interface.
...	

Further information

Punching and nibbling with leader (PONS/SONS)

Punching and nibbling with leader is not possible in more than one channel simultaneously. PONS or SONS can only be activated in one channel at a time.

Path-dependent acceleration (PUNCHACC)

Example:

PUNCHACC (2, 50, 10, 100)

Distance between holes less than 2 mm:

The axis accelerates at a rate corresponding to 50% of maximum acceleration.

Distance between holes from 2 mm to 10 mm:

Acceleration is increased to 100%, proportional to the spacing.

Distance between holes more than 10 mm:

Traverse at an acceleration of 100%.

Initiation of the first stroke

The instant at which the first stroke is initiated after activation of the function differs depending on whether nibbling or punching is selected:

- PON/PONS:
 - All strokes - even the one in the first block after activation - are executed at the block end.
- SON/SONS:
 - The first stroke after activation of the nibbling function is executed at the start of the block.
 - Each of the following strokes is initiated at the block end.

Punching and nibbling on the spot

A stroke is initiated only if the block contains traversing information for the punching or nibbling axes (axes in active plane).

However, to initiate a stroke at the same position, one of the punching/nibbling axes can be programmed with a traversing path of 0.

Machining with rotatable tools

Note

Use the tangential control function if you wish to position rotatable tools at a tangent to the programmed path.

Use of M commands

As in earlier versions, macro technology allows special M functions to be used instead of language commands (compatibility). The M functions and equivalent language commands as used in earlier systems are as follows:

M20, M23	△	SPOF
M22	△	SON
M25	△	PON
M26	△	PDELAYON

Example for macro file:

Program code	Comment
DEFINE M25 AS PON	; Punching on
DEFINE M125 AS PONS	; Punching with leader on
DEFINE M22 AS SON	; Nibbling on
DEFINE M122 AS SONS	; Nibbling with leader on
DEFINE M26 AS PDELAYON	; Punching with delay on
DEFINE M20 AS SPOF	; Punching, nibbling off
DEFINE M23 AS SPOF	; Punching, nibbling off

Programming example:

Program code	Comment
...	
N100 X100 M20	; Position without punch initiation.
N110 X120 M22	; Activate nibbling, initiate stroke before and after motion.
N120 X150 Y150 M25	; Activate punching, initiate stroke at end of motion.
...	

16.2 Automatic path segmentation

Segmentation into path segments

When punching or nibbling is activated, both SPP and SPN segment the total traversing section programmed for the path axes into a number of path segments with the same length (equidistant path segmentation). Internally, each path segment corresponds to a block.

Number of strokes

When punching, the first stroke is realized at the end point of the first path segment; but for nibbling, at the starting point of the first path segment. Therefore the following numbers are obtained over the complete traversing section:

Punching: Number of strokes = number of path segments

Nibbling: Number of strokes = number of path segments +1

Auxiliary functions

Auxiliary functions are executed in the first of the generated blocks.

Syntax

SPP=

SPN=

Meaning

SPP:	Size of path segment (maximum distance between strokes); modal
SPN:	Number of path segments per block; modally effective

Example 1

The programmed nibbling segments should be automatically split-up into path segments.

Program code	Comment
N100 G90 X130 Y75 F60 SPOF	; Positioning at starting point 1
N110 G91 Y125 SPP=4 SON	; Nibbling on; maximum path segment length for automatic path segmentation: 4 mm
N120 G90 Y250 SPOF	; Nibbling off; positioning to starting point 2
N130 X365 SON	; Nibbling on; maximum path segment length for automatic path segmentation: 4 mm
N140 X525 SPOF	; Nibbling off; positioning to starting point 3
N150 X210 Y75 SPP=3 SON	; Nibbling on; maximum path segment length for automatic path segmentation: 3 mm
N160 X525 SPOF	; Nibbling off; positioning to starting point 4
N170 G02 X-62.5 Y62.5 I J62.5 SPP=3 SON	; Nibbling on; maximum path segment length for automatic path segmentation: 3 mm
N180 G00 G90 Y300 SPOF	; Nibbling off

Example 2

Automatic path segmentation should be made for the individual series of holes. The maximum path segment length (SPP value) is specified for the segmentation.

Program code	Comment
N100 G90 X75 Y75 F60 PON	; Position to starting point 1; punch a single hole
N110 G91 Y125 SPP=25	; Maximum path segment length for automatic path segmentation: 25 mm
N120 G90 X150 SPOF	; Punching off; positioning to starting point 2
N130 X375 SPP=45 PON	; Punching on; maximum path segment length for automatic path segmentation: 45 mm
N140 X275 Y160 SPOF	; Punching off; positioning to starting point 3
N150 X150 Y75 SPP=40 PON	; Punching on, instead of the programmed path segment length of 40 mm, the calculated path segment length of 37.79 mm is used.
N160 G00 Y300 SPOF	; Punching off; positioning

16.2.1 Path segmentation for path axes

Length of SPP path segment

SPP is used to specify the maximum distance between strokes and thus the maximum length of the path segments in which the total traversing distance is to be divided. The command is deactivated with SPOF or SPP=0.

Example:

```
N10 SON X0 Y0
```

```
N20 SPP=2 X10
```

The total traversing distance of 10 mm will be divided into five path sections each of 2 mm (SPP=2).

Note

The path segments effected by SPP are always equidistant, i.e. all segments are equal in length. In other words, the programmed path segment size (SPP setting) is valid only if the quotient of the total traversing distance and the SPP value is an integer. If this is not the case, the size of the path segment is reduced internally such as to produce an integer quotient.

Example:

```
N10 G1 G91 SON X10 Y10
```

```
N20 SPP=3.5 X15 Y15
```

When the total traversing distance is 15 mm and the path segment length 3.5 mm, the quotient is not an integer value (4.28). In this case, the SPP value is reduced down to the next possible integer quotient. The result in this example would be a path segment length of 3 mm.

Number of SPN path segments

SPN defines the number of path segments to be generated from the total traversing distance. The length of the segments is calculated automatically. Since SPN is non-modal, punching or nibbling must be activated beforehand with PON or SON respectively.

16.2.2 Path segmentation for single axes

If single axes are defined as punching/nibbling axes in addition to path axes, then the automatic path segmentation function can be activated for them.

Behavior of the single axis for SPP

The programmed path segment length (SPP) basically refers to the path axes. Therefore, in a block in which in addition to the single-axis movement and the SPP value no path axis has been programmed, then the SPP value is ignored.

If both individual and path axes are programmed in the block, then the behavior of the single axis depends on the setting of the appropriate machine data.

1. Default setting

The path traversed by the single axis is distributed evenly among the intermediate blocks generated by SPP.

Example:

```
N10 G1 SON X10 A0
```

```
N20 SPP=3 X25 A100
```

As a result of the stroke distance of 3 mm, for the total traversing distance of the X axis (path axis) of 15 mm, 5 blocks are generated.

The A axis thus rotates through 20 degrees in every block.

1. Single axis without path segmentation

The single axis traverses its complete distance in the first of the generated blocks.

2. Different path segmentation

The behavior of the single axis is dependent on the interpolation of the path axes:

- Circular interpolation: Path segmentation
- Linear interpolation: no path segmentation

Behavior for SPN

The programmed number of path segments also applies if a path axis is not simultaneously programmed.

Precondition: The single axis is defined as punching-nibbling axis.

17.1 Activate/deactivate grinding-specific tool monitoring (TMON, TMOF)

With the predefined procedures TMON(...) and TMOF(...), the grinding-specific tool monitoring is activated or deactivated (geometry and speed monitoring).

Requirement

The tool-specific parameters \$TC_TPG1 to \$TC_TPG9 must be set.

Syntax

```
TMON (<TNo>)
...
TMOF (<TNo>)
```

Meaning

TMON (. . .) :	<p>Activate grinding-specific tool monitoring</p> <p>The command must be programmed in the channel in which the grinding-specific tool monitoring is to be activated.</p>
TMOF (. . .) :	<p>Deactivate grinding-specific tool monitoring</p> <p>The command must be programmed in the channel in which the grinding-specific tool monitoring is to be deactivated.</p>
<TNo>:	<p>T number</p> <p>Note: Only required if the monitoring is to be switched on or off for an inactive grinding wheel rather than the active grinding wheel that is currently in use.</p>
TMOF (0) :	Deactivate monitoring for all tools

Additional functions

18.1 Axis functions (AXNAME, AX, SPI, AXTOSPI, ISAXIS, AXSTRING, MODAXVAL)

"AXNAME" is used, e.g. to generate cycles that are generally valid, if the names of the axes are not known.

"AX" is used to indirectly program geometry and synchronous axes. The axis identifier is saved in a type AXIS variable or is supplied from a command such as "AXNAME" or "SPI".

"SPI" is used if axis functions are programmed for a spindle, e.g. a synchronous spindle.

"AXTOSPI" is used to convert an axis identifier into a spindle index (inverse function to "SPI").

"AXSTRING" is used to convert an axis identifier (data type AXIS) into a string (inverse function to "AXNAME").

"ISAXIS" is used in universal cycles in order to ensure that a specific geometry axis exists and thus that any following \$P_AXNX call is not aborted with an error message.

"MODAXVAL" is used in order to determine the modulo position for modulo rotary axes.

Syntax

```
AXNAME ("string")
AX[AXNAME ("string")]
SPI (n)

AXTOSPI (A) or AXTOSPI (B) or AXTOSPI (C)
AXSTRING ( SPI (n) )
ISAXIS (<geometry axis number>)
<Modulo position>=MODAXVAL (<axis>, <axis position>)
```

Meaning

AXNAME:	Converts an input string into axis identifiers; the input string must contain a valid axis name.
AX:	Variable axis identifier
SPI:	Converts the spindle number into an axis identifier; the transfer parameter must contain a valid spindle number.
n:	Spindle number
AXTOSPI:	Converts an axis identifier into an integer spindle index. "AXTOSPI" corresponds to the inverse function to "SPI".
X, Y, Z:	Axis identifier of AXIS type as variable or constant
AXSTRING:	The string is output with the associated spindle number.

18.1 Axis functions (AXNAME, AX, SPI, AXTOSPI, ISAXIS, AXSTRING, MODAXVAL)

ISAXIS:	Checks whether the specified geometry axis exists.
MODAXVAL:	For modulo rotary axes, determines the modulo position; this corresponds to the modulo rest referred to the parameterized modulo range (in the default setting, this is 0 to 360 degrees; the start and size of the modulo range can be changed using MD30340 MODULO_RANGE_START and MD30330 \$MA_MODULO_RANGE).

Note**SPI extensions**

The axis function SPI(n) can also be used to read and write frame components. This means that frames can be written, e.g. with the syntax `$P_PFRAME[SPI(1),TR]=2.22`.

An axis can be traversed by additionally programming axis positions using the address `AX[SPI(1)]=<axis position>`. The prerequisite is that the spindle is either in the positioning or axis mode.

Examples**Example 1: AXNAME, AX, ISAXIS**

Program code	Comment
OVRA[AXNAME("Transverse axis")]=10	; Override for transverse axis
AX[AXNAME("Transverse axis")]=50.2	; End position for transverse axis
OVRA[SPI(1)]=70	; Override for spindle 1
AX[SPI(1)]=180	; End position for spindle 1
IF ISAXIS(1) == FALSE GOTOF CONTINUE	; Abscissa available?
AX[\$P_AXN1]=100	; Move abscissa
CONTINUE:	

Example 2: AXSTRING

When programming with AXSTRING[SPI(n)], the axis index of the axis, which is assigned to the spindle, is no longer output as spindle number, but instead the string "Sn" is output.

Program code	Comment
AXSTRING[SPI(2)]	; String "S2" is output.

Example 3: MODAXVAL

The modulo position of modulo rotary axis A is to be determined.

Axis position 372.55 is the starting value for the calculation.

The parameterized modulo range is 0 to 360 degrees:

MD30340 MODULO_RANGE_START = 0

MD30330 \$MA_MODULO_RANGE = 360

Program code	Comment
R10=MODAXVAL(A, 372.55)	; Calculated modulo position R10 = 12.55.

*18.1 Axis functions (AXNAME, AX, SPI, AXTOSPI, ISAXIS, AXSTRING, MODAXVAL)***Example 4: MODAXVAL**

If the programmed axis identifier does not refer to a modulo rotary axis, then the value to be converted (<axis position>) is returned unchanged.

Program code	Comment
R11=MODAXVAL(X,372.55)	; X is a linear axis; R11 = 372.55.

18.2 Replaceable geometry axes (GEOAX)

The "Switchable geometry axes" function allows the geometry axes configured via machine data to be replaced by other channel axes.

Syntax

```
GEOAX(<n>,<channel axis>,<n>,<channel axis>,<n>,<channel axis>)
GEOAX()
```

Meaning

GEOAX (. . .)	Function for switching geometry axes. Note: GEOAX () without parameter specification activates the basic configuration of the geometry axes parameterized in the machine data again.
<n>	Number of the geometry axis that is to be replaced by the specified channel axis. Range of values: 0, 1, 2, 3 Note: 0: The specified channel axis is removed from the geometry axis group without being replaced 1: 1. geometry axis \triangleq coordinate axis X (abscissa) of the WCS 2: 2. geometry axis \triangleq coordinate axis Y (ordinate) of the WCS 3: 3. geometry axis \triangleq coordinate axis Z (applicate) of the WCS
<channel axis>	Name of the channel axis which is to added to the geometry axis group

Examples

Example 1: Switching two axes alternating as geometry axis

A tool slide can be traversed using channel axes X1, Y1, Z1, Z2:

The geometry axes are configured so that after powering-up, initially Z1 is effective as 3rd geometry axis under the geometry axis name "Z" and together with X1 and Y1 forms the geometry axis group.

Axes Z1 and Z2 should now be used, alternating, as geometry axis Z in the part program:

Program code	Comment
...	
N100 GEOAX(3,Z2)	; Channel axis Z2 acts as 3rd geometry axis (Z).
N110 G1 ...	
N120 GEOAX(3,Z1)	; Channel axis Z1 acts as 3rd geometry axis (Z).
...	

Example 2: Changing over the geometry axes for six channel axes

A machine has six channel axes with the names XX, YY, ZZ, U, V, W.

The basic setting of the geometry axis configuration via machine data is:

Channel axis XX = 1st geometry axis (X axis)

Channel axis YY = 2nd geometry axis (Y axis)

Channel axis ZZ = 3rd geometry axis (Z axis)

Program code	Comment
N10 GEOAX()	; The basic configuration of the geometry axes is effective.
N20 G0 X0 Y0 Z0 U0 V0 W0	; All axes in rapid traverse to position 0.
N30 GEOAX(1,U,2,V,3,W)	; Channel axis U becomes the first (X), V the second (Y) ; and W the third geometry axis (Z).

18.2 Replaceable geometry axes (GEOAX)

Program code	Comment
N40 GEOAX(1,XX,3,ZZ)	; Channel axis XX becomes the first (X), ZZ the third ; geometry axis (Z). Channel axis V remains the second ; geometry axis (Y).
N50 G17 G2 X20 I10 F1000	; Full circle in the X/Y plane. Channel axes ; XX and V traverse.
N60 GEOAX(2,W)	; Channel axis W becomes the second geometry (Y).
N80 G17 G2 X20 I10 F1000	; Full circle in the X/Y plane. Channel axes ; XX and W traverse.
N90 GEOAX()	; Reset to the initial state.
N100 GEOAX(1,U,2,V,3,W)	; Channel axis U becomes the first (X), V the second ; (Y) and W the third geometry axis (Z).
N110 G1 X10 Y10 Z10 XX=25	; Channel axes U, V, W each traverse to ; position 10. XX as special axis traverses to posi- ; tion 25.
N120 GEOAX(0,V)	; V is removed from the geometry axis group. ; U and W remain the first (X) and third ; geometry axis (Z). ; The second geometry (Y) axis remains unassigned.
N130 GEOAX(1,U,2,V,3,W)	; Channel axis U remains the first (X), V becomes ; the second (Y), W remains the third geometry axis ; (Z).
N140 GEOAX(3,V)	; V becomes the third geometry axis (Z), whereby W ; is overwritten and therefore removed from the geom- ; etry ; axis group. The second geometry axis (Y) ; still remains unassigned.

Machine data

Axis configuration

Assignment of geometry, special and machine axes to channel axes:

- MD10000 \$MN_AXCONF_MACHAX_NAME_TAB
- MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB
- MD20060 \$MC_AXCONF_GEOAX_NAME_TAB
- MD20070 \$MC_AXCONF_MACHAX_USED
- MD20080 \$MC_AXCONF_CHANAX_NAME_TAB
- MD35000 \$MA_SPIND_ASSIGN_TO_MACHAX

Reset behavior

Reset behavior of changed geometry axis assignments:

- MD20110 \$MC_RESET_MODE_MASK, bit 12
- MD20118 \$MC_GEOAX_CHANGE_RESET

NC start behavior

- MD20112 \$MC_START_MODE_MASK, bit 12

Notification to the PLC user program

Parameterization option of the M command which is output on the NC/PLC interface when the geometry axes are changed.

- MD22532 \$MC_GEOAX_CHANGE_M_CODE

Supplementary conditions**No geometry axis changeover**

- If one of the following functions is active, a geometry axis changeover is not possible:
 - Transformation
 - Spline interpolation
 - Tool radius compensation
 - Tool fine offset
- The geometry axis and another channel axis have the same name.
- One of the axes participating in the geometry axis changeover is involved in an action that goes beyond block limits, e.g. block-wide positioning axis or following axis of an axis coupling.

Rotary axes

Rotary axes cannot be programmed as geometry axes.

Axis state after replacing

An axis replaced by the changeover in the geometry axis group can be programmed as supplementary axis after the changeover operation via its channel axis names.

Frames, protection areas, working area limits

All frames, protection areas and working area limits are deleted after changing over the geometry axes.

Polar coordinates

Replacing the geometry axes with `GEOAX` sets analog to a level change with `G17-G19`, the modal polar coordinates to a value of 0.

DRF, WO

A possible handwheel offset (DRF) or an external work offset (WO) remains effective after the changeover.

Basic configuration of the geometry axes

The `GEOAX ()` command calls the basic configuration of the geometry axis group.

The system automatically changes back to the basic configuration after POWER ON and when changing over into the "reference point approach" mode.

Tool length compensation

An active tool length compensation is also effective after the changeover operation. However, for geometry axes that have been newly added or those where the position has been replaced, it is still considered not to have been moved through. For the first motion command for these geometry axes, the resulting traversing distance correspondingly comprises the sum of the tool length compensation and the programmed traversing distance.

Geometry axes, which retain their position in the axis group after a replacement operation, also retain their status with respect to tool length compensation.

Geometry axis configuration for active transformation

- The geometry axis configuration parameterized for an active transformation via transformation machine data cannot be changed using the "Switchable geometry axes" function.
- Different data sets must be parameterized in the transformation machine data for a different geometry axis configuration for a transformation.
- A geometry axis configuration changed using `GEOAX` is deleted by activating a transformation.
- With regard to the geometry axes, the transformation-specific geometry axis parameterizations of active transformations have priority over the parameterizations relevant for the changeover of geometry axes.
Example: A transformation is active. According to the machine data, the transformation should be retained at a channel reset. At the same time, the basic configuration of the geometry axes should be restored at a channel reset. The geometry axis configuration that has been specified for the transformation is retained.
- If a transformation is switched off, the parameterized basic setting of the geometry axis configuration takes effect again.

JOG mode, REF machine function

When switching over to the JOG mode, REF machine function (reference point approach), the geometry axis configuration parameterized in the machine data takes effect

18.3 Axis container (AXCTSWE, AXCTSWED, AXCTSWEC)

The "AXCTSWE" or "AXCTSWED" commands enable the rotation of the specified axis container.

Any previously set enable for axis container rotation is cancelled with the "AXCTSWEC" command.

Syntax

```
AXCTSWE (<ID>)
AXCTSWED (<ID>)
AXCTSWEC (<ID>)
```

Meaning

AXCTSWE:	Enable for rotation of the axis container The program processing is not stopped by "AXCTSWE". The rotation is performed as soon as all channels involved on the axis container have been enabled.	
AXCTSWED:	Enable to rotate the axis container without consideration of the other channels involved on the axis container Note <ul style="list-style-type: none"> Command variant to simplify the commissioning of the part program or synchronized action. The behavior with regard to the other channels involved on axis container can be specified via: MD12760 \$MN_AXCT_FUNCTION_MASK, bit 0 	
AXCTSWEC:	Canceling the enable to rotate the axis container Note The enable for rotating an axis container can only be cancelled when the rotation has yet not been started: \$AN_AXCTSWA[<axis container>] == 0 For system variable, see "Axis container (AXCTSWE, AXCTSWED, AXCTSWEC) (Page 639)"	
<ID>:	Identifier of the axis container or a container axis:	
	CT<number>:	Default identifier of an axis container: MD12750 \$MN_AXCT_NAME_TAB Example: "CT1"
	<Container>:	User-specific identifier of an axis container: MD12750 \$MN_AXCT_NAME_TAB Example: "CONTAINER_1"
	<axis>:	Identifier of a known container axis in the channel

Note**Increment**

The increment of a axis container rotation is set via the setting data:

SD41700 \$SN_AXCT_SWWIDTH

Further information**Diagnostics**

The current status of a axis container can be read via the following system variables:

System variable	Type	Description
\$AC_AXCTSWA[<name>]	BOOL	Channel-specific status of the axis container
\$AN_AXCTSWA[<axis container>]	BOOL	NCU-specific status of the axis container
\$AN_AXCTSWE[<axis container>]	INT	Slot-specific status of the axis container rotation The system variable supplies the status of the axis container slot bitwise . Each bit corresponds to a slot.
\$AN_AXCTAS[<axis container>]	INT	Number of locations (slots) through which the axis container was just switched through.

Axis container rotation with implicit GET / GETD

The following machine data can be use to set that all container axes of the channel are brought into the channel by means of an implicit "GET/GETD" with the "AXCTSWE" command. An axis replacement is only possible again after the container rotation.

MD10722 \$MN_AXCHANGE_MASK, bit 1 = 1

Note

An axis container rotation with implicit "GET/GETD" is **not** performed for an axis in the state "main run axis" (e.g. PLC axis) because the axis would have to exit the state for the axis container rotation.

18.4 Wait for valid axis position (WAITENC)

Using the language command "WAITENC", the NC program waits until the synchronized or restored axis positions are available for the axes configured with MD34800 \$MA_WAIT_ENC_VALID = 1.

An interruption can take place in the wait state, e.g. by starting an ASUB or by changing the operating mode to JOG. When the program is continued, where relevant, the wait state is resumed.

Note

In the user interface, the wait state is displayed using the hold state "Wait for measuring system".

Syntax

"WAITENC" can be programmed in the program section of any NC program.

Programming must be realized in a dedicated block:

```
...
WAITENC
...
```

Example

"WAITENC" is for example used in an event-controlled user program, .../_N_CMA_DIR/_N_PROG_EVENT_SPF, as shown in the following application example.

Application example: Tool withdrawal after POWER OFF with orientation transformation

Machining with tool orientation was interrupted due to a power failure.

When powering up again, the event-controlled user program .../_N_CMA_DIR/_N_PROG_EVENT_SPF is called.

In the event-controlled user program, the system waits for synchronized or restored axis positions using "WAITENC"; in order to then be able to calculate a frame, which aligns the Work in the tool direction.

Program code	Comment
...	
IF \$P_PROG_EVENT == 4	; Run-up.
IF \$P_TRAFO <> 0	; Transformation has been selected.
WAITENC	; Wait for valid axis positions of the orientation axes.
TOROTZ	; Rotate the Z axis of the WCS towards the tool axis.
ENDIF	
M17	
ENDIF	
...	

18.4 Wait for valid axis position (WAITENC)

The tool can then be retracted in JOG mode by means of a retraction movement towards the tool axis.

18.5 Programmable parameter set changeover (SCPARA)

The changeover to a specific parameter set can be requested for an axis with the SCPARA command.

Note

No parameter set changeover during thread cutting

During thread cutting G33 and tapping G331/G332, the parameter set is selected by the control and cannot be changed.

Disabled parameter set changeover

A parameter set changeover can also be requested via the NC/PLC interface. In order to avoid changeover conflicts, the parameter set changeover of the NC (SCPARA) can be disabled via the NC/PLC interface:

DB31, ... DBX9.3 (parameter set specification disabled by NC)

Note

If a parameter set changeover is requested by SCPARA while the parameter set changeover is disabled via the NC/PLC interface, the changeover is rejected without an error message.

Syntax

SCPARA[<axis>]=<value>

Meaning

SCPARA:	Command: Change parameter set	
<axis>:	Axis identifier (channel axis)	
	Type:	AXIS
<value>:	Parameter set number: 1, 2, 3, ... max. parameter set number	

Example

Program code	Comment
...	
N110 SCPARA[X]= 3	; Select: Axis X, 3rd parameter set
...	

Further information

Enable of the parameter set changeover

The parameter set changeover of the axis must be explicitly enabled:

MD35590 \$MA_PARAMSET_CHANGE_ENABLE[<axis>]

18.5 Programmable parameter set changeover (SCPARA)

Read parameter set number

The number of the selected parameter set (specified parameter set) can be read via the system variable \$AA_SCPAR.

References

Detailed information on the parameter sets can be found in:

Function Manual, Basic Functions; Section "Velocities, setpoint / actual value systems, closed-loop control (G2)" > "Closed-loop control" > "Parameter sets of the position controller"

18.6 Check scope of NC language present (STRINGIS)

Using the function "STRINGIS(...)" it can be checked as to whether the specified string is available as element of the NC programming language in the actual language scope.

Definition

```
INT STRINGIS (STRING <Name>)
```

Syntax

```
STRINGIS (<Name>)
```

Meaning

STRINGIS:	Function with return value
<name>:	Name of the NC programming language element to be checked
Return value:	The return value format is yxx (decimal).

Elements of the NC programming language

The following elements of the NC programming language can be checked:

- G commands of all existing G groups, e.g. "G0", "INVCW", "POLY", "ROT", "KONT", "SOFT", "CUT2D", "CDON", "RMBBL", "SPATH"
- DIN or NC addresses, such as "ADIS", "RNDM", "SPN", "SR", "MEAS"
- Functions, e.g. "TANG(...)" or "GETMDACT"
- Procedures, e.g. "SBLOF".
- Keywords, e.g. "ACN", "DEFINE" or "SETMS"
- System data, e.g. machine data \$M... , setting data \$S... or option data \$O...
- System variables \$A... , \$V... , \$P...
- Arithmetic parameter R...
- Cycle names of activated cycles
- GUD and LUD variables
- Macro names
- Label names

Return value

Only the first three decimal positions of the return value are relevant. The return value format is yxx, with y = basis information and xx = detailed information.

Return value	Meaning
000	The 'name' string is not known in this system ¹⁾
100	The 'name' string is an element of the NC programming language, but currently cannot be programmed (option/function is inactive)

18.6 Check scope of NC language present (STRINGIS)

Return value	Meaning
2xx	The 'name' string is a programmable element of the NC programming language (option/function is active). The detailed information xx contains additional information about the element type:
	xx Meaning
	01 DIN address or NC address ²⁾
	02 G command (e.g. G04, INVCW)
	03 Function with return value
	04 Function without return value
	05 Keyword, e.g. DEFINE
	06 Machine (\$M...), setting (\$S...) or option data (\$O...)
	07 System parameters, e.g. system variable (\$...) or arithmetic parameter (R...)
	08 Cycle (the cycle must be loaded into the NC and the cycle program must be active ³⁾)
	09 GUD variable (the GUD variable must be defined in the GUD definition files and the GUD variables activated)
	10 Macro name (the macro must be defined in the macro definition files and macros activated) ⁴⁾
	11 LUD variable of the actual part program
	12 ISO G command (ISO language mode must be active)
400	The 'name' string is an NC address, that was not identified as xx == 01 or xx == 10 and is not G or R ²⁾
y00	No specific assignment possible
<p>1) Depending on the control, under certain circumstances, only a subset of the Siemens NC language commands are known, e.g. SINUMERIK 802D sl. For these controls, for strings that are principally Siemens NC language commands, a value of 0 is returned. This behavior can be changed using MD10711 \$MN_NC_LANGUAGE_CONFIGURATION. For MD10711 = 1, then a value of 100 is always returned for Siemens NC language commands.</p> <p>2) NC addresses are the following letters: A, B, C, E, I, J, K, Q, U, V, W, X, Y, Z. These NC addresses can also be programmed with an address extension. The address extension can be specified when checking with STRINGIS. Example: 201 == STRINGIS("A1").</p> <p>The letters: D, F, H, L, M, N, O, P, S, T are NC addresses or auxiliary functions that are defined by the user. A value of 400 is always returned for these. Example: 400 == STRINGIS("D"). These NC addresses cannot be specified with address extension when checking with STRINGIS.</p> <p>Example: 000 == STRINGIS("M02"), but 400 == STRINGIS("M").</p> <p>3) Names of cycle parameters cannot be checked with STRINGIS.</p> <p>4) Address, defined as macro, e.g. G, H, M, L are identified as macro.</p>	

Examples

In the following examples it is assumed that the NC language elements specified as string - as long as nothing else is noted - can in principle be programmed in the control.

- String "T" is defined as auxiliary function:

```
400 == STRINGIS ("T")
000 == STRINGIS ("T3")
```
- String "X" is defined as axis:

```
201 == STRINGIS ("X")
201 == STRINGIS ("X1")
```
- String "A2" is defined as address with extension:

```
201 == STRINGIS ("A")
201 == STRINGIS ("A2")
```
- String "INVCW" is defined as named G command:

```
202 == STRINGIS ("INVCW")
```

18.6 Check scope of NC language present (STRINGIS)

5. String "\$MC_GCODE_RESET_VALUES" is defined as machine data:
206 == STRINGIS("\$MC_GCODE_RESET_VALUES")
6. String "GETMDACT" is an NC language function:
203 == STRINGIS("GETMDACT ")
7. String "DEFINE" is a keyword:
205 == STRINGIS("DEFINE")
8. String "\$TC_DP3" is a system parameter (tool length component):
207 == STRINGIS("\$TC_DP3")
9. String "\$TC_TP4" is a system parameter (tool size):
207 == STRINGIS("\$TC_TP4")
10. String "\$TC_MPP4" is a system parameter (magazine location state):
 - Tool magazine management is active: 207 == STRINGIS("\$TC_MPP4") ;
 - Tool magazine management is not active: 000 == STRINGIS("\$TC_MPP4")

Also refer to the paragraph below: Tool magazine management.
11. String "MACHINERY_NAME" is defined as GUD variable:
209 == STRINGIS("MACHINERY_NAME")
12. String "LONGMACRO" is defined as macro:
210 == STRINGIS("LONGMACRO")
13. String "MYVAR" is defined as LUD variable:
211 == STRINGIS("MYVAR")
14. String "XYZ" is a command that is not known in the NC, GUD variable, macro or cycle name:
000 == STRINGIS("XYZ")

Tool magazine management

If the tool magazine management function is not active, supplies STRINGIS for the system parameters of the tool magazine management, independent of the machine data

- MD10711 \$MN_NC_LANGUAGE_CONFIGURATION

always a value of 000.

ISO mode

If the "ISO mode" function is active:

- MD18800 \$MN_MM_EXTERN_LANGUAGE (activation, external NC languages)
- MD10880 \$MN_MM_EXTERN_CNC_SYSTEM (control system to be adapted)

STRINGIS checks the specified string initially as SINUMERIK G command. If the string is not a SINUMERIK G command, then it is subsequently checked as ISO G command.

Programmed switchovers (G290 (SINUMERIK mode), G291 (ISO Mode)) have no effect on STRINGIS.

Example

The machine data, relevant for the function STRINGIS(...), has the following values:

- MD10711 \$MN_NC_LANGUAGE_CONFIGURATION = 2 (only the NC language commands whose options are set are considered to be known)
- MD19410 \$ON_TRAFO_TYPE_MASK = 'H0' (option: transformations)
- MD10700 \$MN_PREPROCESSING_LEVEL='H43' (preprocessing for cycles is active)

The following program example is executed without error message:

Program code	Comment
N1 R1=STRINGIS("TRACYL")	; R1 == 0, because TRACYL is identified as "not known" because of the missing transformation option
N2 IF STRINGIS("TRACYL") == 204	
N3 TRACYL(1,2,3)	; N3 is skipped
N4 ELSE	
N5 G00	; and instead, N5 is executed
N6 ENDIF	
N7 M30	

18.7 Interactively call the window from the part program (MMC)

Via the predefined subprogram MMC(...), user-specific dialogs can be displayed from an NC program on the user interface of SINUMERIK Operate, for example.

The configuration of the dialogs can be done for the following types of dialogs:

- Run MyScreens
- Easy XML
- User XML

References

- Programming Manual Run MyScreens
- Programming Manual Easy XML

Syntax

```
MMC ("<ADDRESS>,<COMMAND>,<FILE>,<DIALOG>" , "<QUIT>")
```

Meaning

MMC (. . .):	Subprogram identifier The parameters are specified position-coded and separated by a comma within two strings, the command string and the acknowledgement string.	
Parameters within the command string:		
<ADDRESS>:	Operating area in which the configured user dialog boxes are implemented	
	Function	Operating areas
	"Run MyScreens" user dialog	CYCLES
	"Easy XML" user dialog	CYCLES
	User XML	XML
	Pop-up window "Run MyScreens"	POPUPDLG
	Popup window "Easy XML"	POPUPDLG
<COMMAND>:	Command to be executed	
	Function	Commands
	"Run MyScreens" user dialog	PICTURE_ON, PICTURE_OFF
	"Easy XML" user dialog	PICTURE_ON, PICTURE_OFF
	User XML	XML_ON, XML_OFF
	Pop-up window "Run MyScreens"	PICTURE_ON, PICTURE_OFF
	Popup window "Easy XML"	PICTURE_ON, PICTURE_OFF

18.7 Interactively call the window from the part program (MMC)

<FILE>:	Name of the file in which the dialog to be displayed is programmed	
	Function	Files
	"Run MyScreens" user dialog	<name>.com
	"Easy XML" user dialog	<name>.xml
	User XML	<name>.xml
	Pop-up window "Run MyScreens"	<name>.com
	Popup window "Easy XML"	<name>.xml
<DIALOG>:	Name of the dialog to be displayed	
	Function	Dialog name
	All functions except popup window "Easy XML" with configuration direct in the NC program	Name of the dialog configured in the <FILE> file
	Popup window "Easy XML" with configuration direct in the NC program (see example 3)	main
Parameters within the acknowledgment string:		
<QUIT>:	Acknowledgment type	
	N:	<p>No acknowledgment.</p> <p>Program execution is continued when the command has been transmitted. There is no feedback if the command could not be successfully executed.</p> <p>Note</p> <p>Acknowledgement type "N" must be used if a display time (dwell time) is programmed in the NC program (see Example 2 below)</p>
	A:	<p>Asynchronous acknowledgment</p> <p>The program execution is continued after the command is issued. The return value is saved in a user-specific acknowledgement variable (GUD variable), which is defined within the scope of the dialog configuration, and can be read in the NC program.</p>

Example

Example 1

Display of a dialog and response to the user operation in an NC program.

Program code	Comment
; The acknowledgement variable QUIT has already been created as a global user variable (GUD)	
; Of the type STRING when the dialog was configured:	
; DEF NCK STRING[20] QUIT	
QUIT = "XXX"	; Initialize acknowledgment variable
G4 F5	

18.7 Interactively call the window from the part program (MMC)

Program code	Comment
MMC("CYCLES,PIC- TURE_ON,test.com,test1","A")	; Display dialog ; - Operating area: CYCLES ; - Picture status: PICTURE_ON (display) ; - Dialog screen file: test.com ; - Dialog screen: test1
INPUT:	; Wait for user input
STOPRE	; Preprocessing stop
IF MATCH (QUIT,"RUN") >= 0 GOTOF WORK	; Softkey "RUN"
IF MATCH (QUIT,"CHK") >= 0 GOTOF CHECK	; Softkey "CHK"
GOTOB INPUT	; => Wait
WORK:	; Softkey "RUN" pressed
MSG("Continue with processing -> NC start")	; Output message
MMC("CYCLES,PICTURE_OFF","N")	; Close dialog
M0	; Wait for NC start
GOTOF END	; => Program end
CHECK:	; Softkey "CHK" pressed
MSG("Approach position -> NC start")	; Output message
MMC("CYCLES,PICTURE_OFF","N")	; Close dialog
M0	; Wait for NC start
GOTOF END	; => Program end
END:	
...	

Example 2

The display time of a dialog is defined in the NC program via a dwell time, for example.

Program code	Comment
F1000 G94	
...	
MMC("POPUPDLG,PICTURE_ON,xmldial_emb.xml,main","N")	; Display dialog
X200	
Z40	
MMC("POPUPDLG,PICTURE_OFF","N")	; Close dialog

Example 3

Embedding a popup script in an NC program and its use.

Program code

```
PROC POPUP_TEST
; ----- Script -----
; <main_dialog entry="rpara_main">
```

18.7 Interactively call the window from the part program (MMC)

Program code

```

;   <let name="xpos" />
;   <let name="ypos" />
;   <let name="field_name" type="string" />
;   <let name="num" />
;   <menu name="rpara_main">
;       <open_form name="rpara_form"/>
;       <softkey_back>
;           <close_form />
;       </softkey_back>
;   </menu>
;   <form name="rpara_form">
;       <init>
;           <caption>mask from NC part program</caption>
;           <let name="count" >0</let>
;           <op>
;               xpos = 120;
;               ypos = 34;
;               "nck/Channel/Parameter/R[10]" = 10;
;           </op>
;           <!-- load the number of controls -->
;           <op>
;               num = "nck/Channel/Parameter/R[10]";
;           </op>
;           <while>
;               <condition> count < num</condition>
;               <print name="field_name" text="edit%d">count</print>
;               <op>
;                   ypos = ypos + 24;
;                   count = count + 1;
;               </op>
;           </while>
;       </init>
;       <paint>
;           <op>
;               xpos = 8;
;               ypos = 36;
;               count = 0;
;           </op>
;           <while>
;               <condition>count < num</condition>
;               <print name="field_name" text="R-Parameter%d">count</print>
;               <text xpos = "$xpos" ypos = "$ypos" >$$$field_name</text>
;               <op>
;                   ypos = ypos + 24;

```

*18.7 Interactively call the window from the part program (MMC)***Program code**

```

;           count = count + 1;
;           </op>
;           </while>
;           </paint>
;           </form>
; </main_dialog>
; ===== Program section =====
...
G94 F100
MMC ("POPUPDLG, PICTURE_ON, xml_dial_emb.xml, main", "N")
G4 F4
X200
MMC ("POPUPDLG, PICTURE_OFF", "N")
G4 F2
X0
...

```

Supplementary conditions

- The definition files *.com of the dialogs must be saved in the "proj" folder.
- The Easy XML definition files *.xml of the dialogs must be saved in the "appl" folder.
If the definition files are saved in a different directory, the path must be specified indirectly, starting from the "appl" directory.
- User-defined dialogs cannot be simultaneously displayed from different channels.

18.8 Program runtime/part counter

Information on the program runtime and workpiece counter are provided to support the machine tool operator.

This information can be processed as system variables in the NC and/or PLC program. This information is also available to be displayed on the operator interface.

18.8.1 Program runtime

The "program runtime" function provides internal NC timers to monitor technological processes, which can be read into the part program and into synchronized actions via the NC and channel-specific system variables.

The trigger for the runtime measurement (\$AC_PROG_NET_TIME_TRIGGER) is the only system variable of the function that can be written to – and is used to selectively measure program sections. This means, by writing \$AC_PROG_NET_TIME_TRIGGER in the NC program, the time measurement can be enabled and disabled again:

System variable	Meaning	Activity
NC-specific		
\$AN_SETUP_TIME	Time since the last control power up with default values ("cold restart") in minutes. Is automatically reset to "0" every time the control powers up with default values.	<ul style="list-style-type: none">• Always active
\$AN_POWERON_TIME	Time since the last normal control power up ("warm restart") in minutes. Is automatically reset to "0" every time the control powers up normally.	
Channel-specific		
\$AC_OPERATING_TIME	Total runtime of NC programs in automatic mode in seconds. The value is automatically reset to "0" every time the control powers up.	<ul style="list-style-type: none">• Activated via MD27860• Only AUTOMATIC mode
\$AC_CYCLE_TIME	Runtime of the selected NC program in seconds. The value is automatically reset to "0" every time a new NC program starts up.	
\$AC_CUTTING_TIME	Processing time in seconds The runtime of the path axes (at least one is active) is measured in all NC programs between NC start and end of program/NC reset without rapid traverse active. The measurement is interrupted when a dwell time is active. The value is automatically reset to "0" every time the control powers up with default values.	

System variable	Meaning	Activity	
\$AC_ACT_PROG_NET_TIME	Actual net runtime of the current NC program in seconds. Is automatically reset to "0" when a new NC program starts.	<ul style="list-style-type: none">• Always active• Only AUTOMATIC mode	
\$AC_OLD_PROG_NET_TIME	Net runtime in seconds of the program that has just be correctly ended with M30		
\$AC_OLD_PROG_NET_TIME_COUNT	Changes to \$AC_OLD_PROG_NET_TIME After POWER ON, \$AC_OLD_PROG_NET_TIME_COUNT is at "0". \$AC_OLD_PROG_NET_TIME_COUNT is always increased if the control has newly written to \$AC_OLD_PROG_NET_TIME.		
\$AC_PROG_NET_TIME_TRIGGER	Trigger for the runtime measurement:		<ul style="list-style-type: none">• Only AUTOMATIC mode
	0	Neutral state The trigger is not active.	
	1	Exit Ends the measurement and copies the value from \$AC_ACT_PROG_NET_TIME into \$AC_OLD_PROG_NET_TIME. \$AC_ACT_PROG_NET_TIME is set to "0" and then continues to run.	
	2	Start Starts the measurement and in so doing sets \$AC_ACT_PROG_NET_TIME to "0". \$AC_OLD_PROG_NET_TIME is not changed.	
	3	Stop Stops the measurement. Does not change \$AC_OLD_PROG_NET_TIME and keeps \$AC_ACT_PROG_NET_TIME constant until it resumes	
	4	Resume The measurement is resumed, i.e. a measurement that was previously stopped is continued. \$AC_ACT_PROG_NET_TIME continues. \$AC_OLD_PROG_NET_TIME is not changed.	

All system variables are reset to 0 as a result of POWER ON!

Note

Machine manufacturer

Machine data MD27860 \$MC_PROCESSTIMER_MODE is used to switch-in the timer that can be activated.

The behavior of active time measurements for certain functions (e.g. GOTOS, override = 0%, active test run feed, program test, ASUB, PROG_EVENT, ...) is configured using machine data MD27850 \$MC_PROG_NET_TIMER_MODE and MD27860 \$MC_PROCESSTIMER_MODE.

References:

Function Manual, Basic Functions; BAG, Channel, Program Operation, Reset Response (K1), Chapter: Program runtime

Note

Residual time for a workpiece

If the same workpieces are machined one after the other, using the following timer values, the remaining residual time for a workpiece can be determined.

- Processing time for the last workpiece produced (see \$AC_OLD_PROG_NET_TIME)
- Current processing time (see \$AC_ACT_PROG_NET_TIME)

The residual time is displayed on the user interface in addition to the current processing time.

Note

Using STOPRE

The system variables \$AC_OLD_PROG_NET_TIME and \$AC_OLD_PROG_NET_TIME_COUNT do not generate any implicit preprocessing stop. This is uncritical when used in the part program if the value of the system variables comes from the previous program run. However, if the trigger for the runtime measurement (\$AC_PROG_NET_TIME_TRIGGER) is written very frequently and as a result \$AC_OLD_PROG_NET_TIME changes very frequently, then an explicit STOPRE should be used in the part program.

Supplementary conditions

- **Block search**
No program runtimes are determined through block searches.
- **REPOS**
The duration of a REPOS process is added to the current processing time (\$AC_ACT_PROG_NET_TIME).

Examples

Example 1: Measuring the duration of "mySubProgrammA"

Program code

```
...  
N50 DO $AC_PROG_NET_TIME_TRIGGER=2  
N60 FOR ii= 0 TO 300  
N70 mySubProgrammA  
N80 DO $AC_PROG_NET_TIME_TRIGGER=1  
N95 ENDFOR  
N97 mySubProgrammB  
N98 M30
```

After the program has processed line N80, the net runtime of "mySubProgrammA" is located in \$AC_OLD_PROG_NET_TIME.

The value from \$AC_OLD_PROG_NET_TIME:

- is kept beyond M30.
- is updated each time the loop is run through.

Example 2: Measuring the duration of "mySubProgrammA" and "mySubProgrammC"

Program code

```
...  
N10 DO $AC_PROG_NET_TIME_TRIGGER=2  
N20 mySubProgrammA  
N30 DO $AC_PROG_NET_TIME_TRIGGER=3  
N40 mySubProgrammB  
N50 DO $AC_PROG_NET_TIME_TRIGGER=4  
N60 mySubProgrammC  
N70 DO $AC_PROG_NET_TIME_TRIGGER=1  
N80 mySubProgrammD  
N90 M30
```

18.8.2 Workpiece counter

The "Workpiece counter" function makes available various counters which can be used in particular internally in the control to count workpieces.

The counters exist as channel-specific system variables with read and write access in a range of values from 0 to 999 999 999.

System variable	Meaning
\$AC_REQUIRED_PARTS	Number of workpieces to be produced (setpoint number of workpieces) In this counter the number of workpieces at which the actual workpiece count (\$AC_ACTUAL_PARTS) will be reset to "0" can be defined.
\$AC_TOTAL_PARTS	Total number of completed workpieces (actual workpiece total) This counter specifies the total number of all workpieces produced since the start time. The value is only automatically reset to "0" when the control powers up with default values.
\$AC_ACTUAL_PARTS	Number of completed workpieces (actual workpiece total) This counter registers the total number of all workpieces produced since the start time. On condition that \$AC_REQUIRED_PARTS > 0, the counter is automatically reset to "0" when the required number of workpieces (\$AC_REQUIRED_PARTS) is reached.
\$AC_SPECIAL_PARTS	Number of workpieces selected by the user This counter supports user-specific workpiece counts. An alarm can be defined to be output when the setpoint number of workpieces is reached (\$AC_REQUIRED_PARTS). Users must reset the counter themselves.

Note

All workpiece counters are set to "0" when the control powers up with default values and can be read and written independent of their activation.

Note

Channel-specific machine data can be used to control counter activation, counter reset timing and the counting algorithm.

Note

Workpiece counting with user-defined M command

Machine data can be set so that the count pulses for the various workpiece counters are triggered using user-defined M commands rather than the end of the program (M2/M30).

18.9 Process DataShare - Output to an external device/file (EXTOPEN, WRITE, EXTCLOSE):

The writing of data from a part program to an external device/file is performed in three steps:

1. Open the external device/file
The external device/file is opened for the channel for writing using the EXTOPEN command.
2. Writing data
The output data can be processed using the string functions of the NC language, e.g. SPRINT. The WRITE command is used for writing.
3. Close the external device/file
The external device/file assigned in the channel is released again using the EXTCLOSE command, when the end of the program is reached (M30) or for a channel reset.

Syntax

```
DEF INT <Result>
DEF STRING[<n>] <Output>
...
EXTOPEN(<Result>,<ExtDev>,<SyncMode>,<AccessMode>,<WriteMode>)
...
<Output>="data output"
WRITE(<Result>,<ExtDev>,<Output>)
...
EXTCLOSE(<Result>,<ExtDev>)
```

Meaning

EXTOPEN:	Pre-defined procedure to open an external device/file	
<Result>:	Parameter 1: Result variable	
	By using the result variable value, it can be evaluated in the program as to whether the operation was successful and processing is then appropriately continued.	
	Type:	INT
	Values:	0 No error
		1 External device cannot be opened
		2 External device is not configured
		3 External device with invalid path configured
		4 No access rights for external device
		5 Usage mode: External device already "exclusively" occupied
		6 Usage mode: External device already being "shared"
		7 File length longer than LOCAL_DRIVE_MAX_FILESIZE
		8 Maximum number of external devices has been exceeded
		9 Option for LOCAL_DRIVE not set
		11 V.24 interface has already been assigned with Easy-Message function (only 828D)
		12 Write mode: Data contradicts extdev.ini
		16 Invalid external path has been programmed
		22 External device not mounted

18.9 Process DataShare - Output to an external device/file (EXTOPEN, WRITE, EXTCLOSE):

<ExtDev>:	Parameter 2: Symbolic identifier for the external device/file to be opened	
	Type:	STRING
	The symbolic identifier comprises:	
	1. the logical device name	
	2. where relevant, followed by a file path (attached using "/").	
	The following logical device names have been defined:	
	"LOCAL_DRIVE":	Local CF card (pre-defined)
	"CYC_DRIVE":	Reserved drive name for use in SIEMENS cycles (pre-defined)
	"/dev/ext/1", ... "/dev/ext/9":	Available network drives Note: It is necessary to configure in the extdev.ini file!
	"/dev/cyc/1", "/dev/cyc/2":	Reserved drive names for use in SIEMENS cycles Note: It is necessary to configure in the extdev.ini file!
	"/dev/v24":	V.24 interface Note: It is necessary to configure in the extdev.ini file!
File path:		
<ul style="list-style-type: none"> A file path must be specified for "LOCAL_DRIVE" and "CYC_DRIVE" e.g. "LOCAL_DRIVE/my_dir/my_file.txt" The logical device names "/dev/ext/1...9" and "/dev/cyc/1...2" can be configured: <ul style="list-style-type: none"> To already refer to a file, in which case only the logical device names may be specified, e.g.: "/dev/ext/4" Or to a directory, in which case a file path must be specified, e.g.: "/dev/ext/5/my_dir/my_file.txt" It is not permissible that a file path is attached to "/dev/v24". 		
Note:		
For the logical device names "/dev/ext/1...9", "/dev/v24" and "/dev/cyc/1...2" uppercase/lowercase is ignored; uppercase/lowercase is significant for specifying a path to a file. Only uppercase letters are permissible for "LOCAL_DRIVE" and "CYC_DRIVE".		

18.9 Process DataShare - Output to an external device/file (EXTOPEN, WRITE, EXTCLOSE):

<SyncMode>:	Parameter 3: Processing mode for the WRITE commands to this device/file	
	Type:	STRING
	Values:	"SYN": Synchronous writing Program execution is stopped until the write operation has been completed. Successfully completing the synchronous write operation can be checked by evaluating the error variables of the WRITE command.
		"ASYN": Asynchronous writing Program execution is not interrupted by the WRITE command. Note. In this mode, the result variable of the WRITE command does not provide any information and always has the value 0 (no error). In this particular mode, there is no certainty that the WRITE command was successful.
<AccessMode>:	Parameter 4: Usage mode for this device/file	
	Type:	STRING
	Values:	"SHARED": Device/file is requested in the "shared" mode. Other channels can also use the device, i.e. also open in this mode.
		"EXCL": Device/file is exclusively used in the channel; no other channel can use the device.
<WriteMode>:	Parameter 5: Write mode for the WRITE commands to this file/device (optional)	
	Type:	STRING
	Values:	"APP": Attaching The file is always kept regarding its contents; write calls are attached at the end.
		"OVR": Overwrite The contents of the file are deleted and re-generated using the subsequent write calls.
	Note: Using this parameter, the write mode configured in the extdev.ini file cannot be overwritten. In the case of a conflict, then the EXTOPEN call is acknowledged with error.	

WRITE:	Pre-defined procedure to write output data
--------	--

18.9 Process DataShare - Output to an external device/file (EXTOPEN, WRITE, EXTCLOSE):

EXTCLOSE:	Pre-defined procedure to close an external device/file that has been opened		
<Result>:	Parameter 1: Result variable		
	Type:	INT	
	Values:	0	No error
		16	Invalid external path has been programmed
		21	Error when closing the external device
<ExtDev>:	Parameter 2: Symbolic identifier for the external device/file description to be closed, see EXTOPEN! Note: The identifier must be identical to the identifier specified in the EXTOPEN call!		

Example

Program code	
N10	DEF INT RESULT
N20	DEF BOOL EXTDEVICE
N30	DEF STRING[80] OUTPUT
N40	DEF INT PHASE
N50	EXTOPEN(RESULT,"LOCAL_DRIVE/my_file.txt","SYN","SHARED")
N60	IF RESULT > 0
N70	MSG("Error for EXTOPEN:" << RESULT)
N80	ELSE
N90	EXTDEVICE=TRUE
N100	ENDIF
...	
N200	PHASE=4
N210	IF EXTDEVICE
N220	OUTPUT=SPRINT("End phase: %D",PHASE)
N230	WRITE(RESULT,"LOCAL_DRIVE/my_file.txt",OUTPUT)
N240	ENDIF
...	

See also

String operations (Page 84)

Write file (WRITE) (Page 145)

18.10 Alarms (SETAL)

Alarms can be set in an NC program. Alarms are displayed in a separate field at the user interface. An alarm always goes hand in hand with a response from the control according to the alarm category.

References:

For further information on alarm responses, refer to the Commissioning Manual.

Syntax

```
SETAL(<alarm number>[,<character string>])
```

Meaning

SETAL:	Keyword to program an alarm. SETAL must be programmed in a separate NC block.	
<alarm number>:	Type INT variable. Contains the alarm number. The valid range for alarm numbers lies between 60000 and 69999, of which 60000 to 64999 are reserved for SIEMENS cycles and 65000 to 69999 are available to users.	
<character string>:	When programming user cycle alarms, in addition, a character string with up to four parameters can be specified. Variable user texts can be defined in these parameters. However, the following predefined parameters are available:	
	Parameter	Meaning
	%1	Channel number
	%2	Block number, label
	%3	Text index for cycle alarms
	%4	Additional alarm parameters

Note

Alarm texts must be configured in the user interface.

Note

If an alarm is to be output in the language active at the user interface, then the user requires information about the language that is currently set at the HMI. This information can be interrogated in the part program and in the synchronized actions using system variable \$AN_LANGUAGE_ON_HMI (see "Currently set language in the HMI (Page 914)").

Example

Program code	Comment
...	
N100 SETAL (65000)	;Set alarm no. 65000
...	

18.11 Extended stop and retract (ESR)

The extended stop and retract function - subsequently called ESR - offers the possibility of flexibly responding when a fault situation occurs as a function of the process:

- **Extended stop**
Assuming that the specific fault situation permits it, all of the axes, enabled for extended stopping, are stopped in an orderly way.
- **Retraction**
The tool currently in use is retracted from the workpiece as quickly as possible.
- **Generator operation (SINAMICS drive function "Vdc control")**
If a parameterizable value of the DC-link voltage is fallen below, e.g. because the line voltage fails, the electrical energy required for retraction is generated by recovering the braking energy of the drive intended for this purpose (generator operation).

Trigger sources

General sources (NC-external/global or mode group-/channel-specific):

- Digital inputs (e.g. on NCU module or the control-internal digital output image that can be read back (\$A_IN, \$A_OUT))
- Channel state (\$AC_STAT)
- VDI signals (\$A_DBB)
- Group messages of a number of alarms (\$AC_ALARM_STAT)

Axial sources

- Emergency retraction threshold of the following axis (synchronism of electronic coupling, \$VA_EG_SYNCDIFF[<following axis>])
- Drive: DC-link warning threshold (imminent undervoltage), \$AA_ESR_STAT[<axis>]
- Drive: Generator minimum speed threshold (no further regenerative rotation energy available), \$AA_ESR_STAT[<axis>].

Gating logic of the static synchronized actions: Source/response link

The static synchronized actions' flexible gating possibilities are used to trigger specific reactions relatively quickly according to the sources.

Linking all relevant sources using static synchronized actions is the responsibility of the user. They can selectively evaluate the source system variables as a whole or by means of bit masks, and then make a logic operation with their desired reactions. The static synchronous actions are effective in all operating modes.

References:

Function Manual, Synchronized Actions

Activation

Function enable

The functions generator operation, shutdown, retraction are released by setting the corresponding control signal \$AA_ESR_ENABLE. This control signal can be changed by synchronized actions.

Function triggering

ESR is triggered jointly for all enabled axes by setting the system variable \$AC_ESR_TRIGGER.

Generator operation is "automatically" activated in the drive when an imminent DC-link undervoltage is detected.

Drive-independent stopping and/or retraction become active when a communication failure (between the NC and drive) is detected and when a DC-link undervoltage is detected in the drive (configuration and enable required).

Drive-independent stopping and/or retraction can also be triggered by the NC by setting the appropriate control signal \$AN_ESR_TRIGGER (broadcast command to all drives).

References

For detailed information on ESR, see:

Function Manual, Special Functions; Extended Stop and Retract (R3)

18.11.1 NC-controlled ESR

18.11.1.1 NC-controlled retraction (POLF, POLFA, POLFMASK, POLFMLIN)

Certain initial conditions are required for NC-controlled retraction (see "NC-controlled retraction (POLF, POLFA, POLFMASK, POLFMLIN) (Page 666)"). When these requirements have been satisfied, then the rapid lift (LIFTFAST) configured for retraction axis(axis) in the channel is activated by setting the system variable \$AC_ESR_TRIGGER (or \$AA_ESR_TRIGGER for single axes).

Syntax

```
POLF(<axis>)=<position>
POLFA(<axis>,<type>,<position>)
POLFMASK(<axis_1>,<axis_2>,...)
POLFMLIN(<axis_1>,<axis_2>,...)
```

The following abbreviated forms are permitted for POLFA:

```
POLFA(<axis>,<type>) ; Abbreviated form for single axis retraction
POLFA(axis,0/1/2) ; Quick deactivation or activation
POLFA(axis,0,$AA_POLFA[axis]) ; Causes a preprocessing stop
POLFA(axis,0) ; Does not cause a preprocessing stop
```

Meaning

POLF:	Address for specifying the target position of the retraction axis POLF is modal.			
	<axis>:	Name of the geometry or channel/machine axis that retracts		
	<position>:	Retraction position		
		Type:	REAL	
		WCS is valid for geometry axes, otherwise MCS. With the same identifiers for geometry and channel/machine axes, retraction is in the WCS.		
POLFA:	Predefined subprogram call for the specification of the retraction position of single axes			
	<axis>:	Channel axis identifier		
	<type>:	Position specification mode		
		Type:	INT	
		Value:	0:	Mark position value as invalid
			1:	Position value is absolute
			2:	Position value is incremental (distance)
	Note: If an axis is not a single axis or if the type is missing or type=0, then a corresponding alarm is output.			
	<position>:	Retraction position (see above)		
		Note: The position value is also accepted with type=0. Only this value is marked as invalid and has to be reprogrammed for retraction.		
POLFMASK:	Predefined subprogram call for selection of the axes that are to be retracted after tripping of rapid lift independently of one another .			
	<axis_1>, ...:	Names of the axes that are to be traversed to their positions defined with POLF during rapid lift. All the axes specified must be in the same coordinate system.		
	POLFMASK () without specification of an axis deactivates the rapid lift for all axes that have been retracted independently of one another.			
POLFMLIN:	Predefined subprogram call for selection of the axes that are to be retracted after tripping of rapid lift in linear relation .			
	<axis_1>, ...:	See above.		
	POLFMLIN () without specification of an axis deactivates the rapid lift for all axes that have been retracted in linear relation.			

Note

Before rapid retraction to a fixed position can be enabled via POLFMASK or POLFMLIN, a position must have been programmed with POLF for the selected axes.

Note

If axes are enabled one after the other with POLFMASK, POLFMLIN or POLFMLIN, POLFMASK, then the last definition always applies for the particular axis.

Note

The positions programmed with `POLF` and the activation by `POLFMASK` or `POLFMLIN` are deleted when the part program is started. This means that the user must reprogram the values for `POLF` and the selected axes in `POLFMASK` or `POLFMLIN` in each part program.

Note

If, when using the abbreviated form `POLFA` only the type is changed, then the user must ensure that either the retraction position or the retraction path contains a practical and sensible value. In particular, the retraction position and the retraction path have to be set again after Power On.

Example

Retracting an individual axis:

Program code	Comment
MD37500 \$MA_ESR_REACTION[AX1]=21	; NC-controlled retraction.
...	
\$AA_ESR_ENABLE[AX1]=1	
POLFA (AX1,1,20.0)	; AX1 is assigned the axial retraction position 20.0 (absolute).
\$AA_ESR_TRIGGER[AX1]=1	; Retraction starts from here.

Further information**Requirements for NC-controlled retraction**

- A retraction axis is configured for the NC-controlled retraction in the channel:
MD37500 \$MA_ESR_REACTION = 21
- ESR must be enabled for this axis:
\$AA_ESR_ENABLE = 1
- Delay times are defined:
MD21380 \$MC_ESR_DELAY_TIME1
MD21381 \$MC_ESR_DELAY_TIME2
- The axis-specific retraction positions have been configured with `POLF` in the part program.
- The axes are selected with `POLFMASK`/`POLFMLIN` for the NC-controlled retraction.
- The activate signals must be set for the retraction movement and remain set.

Enable and start NC-controlled reactions

If system variable `$AC_ESR_TRIGGER = 1` is set and if a retraction axis is configured in this channel (i.e. MD37500 \$MA_ESR_REACTION = 21) and `$AA_ESR_ENABLE = 1` is set for this axis, then rapid lift (LIFTFAST) is activated in this channel.

The lift movement configured with `POLF` (or `POLF`) for the axes selected with `POLFMASK` or `POLFMLIN` replaces the path motion defined for these axes in the part program.

The sum of the MD21380 \$MC_ESR_DELAY_TIME1 and MD21381 \$MC_ESR_DELAY_TIME2 times is the maximum available for the retraction. When this time has expired, rapid deceleration with follow-up is also initiated for the retraction axis.

Note

The extended retraction (i.e. LIFTFAST/LFPOS triggered by \$AC_ESR_TRIGGER) **cannot be interrupted** and can only be terminated prematurely via an emergency stop.

Note

Retraction initiated via \$AC_ESR_TRIGGER is locked, in order to prevent multiple retractions.

Single axis retraction

With single axis retraction, the retraction position of the single axis must have been programmed with POLFA and the following conditions must be satisfied:

- \$AA_ESR_ENABLE = 1
- <Axis> must be a single axis at the time of triggering (\$AAAA_ESR_TRIGGER = 1).
- <Type> must be either 1 or 2.

Retraction direction during rapid lift

The frame valid at the time when the lift fast is activated is taken into consideration.

Note

Frames with rotation also affect the direction of lift via POLF.

Axis replacement

Retraction axes must always be assigned to exactly one NC channel and may not be switched among the channels. When an attempt is made to exchange a retraction axis in another channel, an alarm is output. Only once this axis has been deactivated again using \$AA_ESR_ENABLE[AX] = 0 can it be exchanged in a new channel. Once the axis has been exchanged, axes can be acted upon again with \$AA_ESR_ENABLE[AX] = 1.

Neutral axes

Neutral axes cannot undertake NC-controlled ESR.

18.11.1.2 NC-controlled stopping

The NC-controlled stopping is activated for the stopping axes configured in the channel by setting system variable \$AC_ESR_TRIGGER (or \$AA_ESR_TRIGGER for single axes).

Requirements

- A stopping axis is configured for the NC-controlled stopping in the channel:
MD37500 \$MA_ESR_REACTION = 22
- ESR must be enabled for this axis:
\$AA_ESR_ENABLE = 1
- Delay times are defined:
MD21380 \$MC_ESR_DELAY_TIME1 (delay time, ESR axes)
MD21381 \$MC_ESR_DELAY_TIME2 (ESR time for interpolatory braking)

Execution

This axis continues interpolating as programmed for the time period set in MD21380: After the time delay specified in MD21380 has expired, controlled braking (ramp stop) is initiated: The time period in MD21381 is the maximum available for the interpolatory controlled braking. After this period expires, fast braking with subsequent tracking is initiated.

Example

Stopping a single axis:

Program code	Comment
MD37500 \$MC_ESR_REACTION[AX1] = 22	; NC-controlled stopping.
MD21380 \$MC_ESR_DELAY_TIME1[AX1] = 0.3	
MD21381 \$MC_ESR_DELAY_TIME2[AX1] = 0.06	
...	
\$AA_ESR_ENABLE[AX1]=1	
\$AA_ESR_TRIGGER[AX1]=1	; Stopping starts from here.

18.11.2 Drive-integrated ESR

18.11.2.1 Configuring drive-integrated stopping (ESRS)

The drive parameters for "stopping" of the drive-integrated ESR function are configured using the `ESRS (...)` function.

Syntax

```
ESRS(<access_1>,<stopping time_1>[,...,<axis_n>,<stopping time_n>])
```

Meaning

ESRS (...):	Function to write to the drive parameters for the ESR function "stopping" The function: <ul style="list-style-type: none"> • Must be alone in the block. • Triggers a preprocessing stop. • Cannot be used in synchronized actions. 	
<axis_1>, ..., <axis_n>:	Axis for which drive-integrated stopping should be configured For this axis, drive parameter p0888 (configuration) is written to in the drive: p0888 = 1	
	Type:	AXIS
	Range of values:	Channel axis identifier
<stopping time_1>, ..., <stopping time_n>:	Time during which the drive continues to travel with the actual speed setpoint after a fault has occurred For the specified axis, drive parameter p0892 (timer) is written to in the drive: p0892 = <stopping time>	
	Unit:	s
	Type:	REAL
	Range of values:	0.00 - 20.00
A maximum of 5 axes can be programmed in a function call; n = 5		

18.11.2.2 Configuring drive-integrated retraction (ESRS)

The drive parameters for "retraction" of the drive-integrated ESR function are configured using the `ESRR (...)` function.

Syntax

```
ESRR(<axis_1>,<retraction distance_1>,<retraction
velocity_1>[,...,<axis_n>,<retraction distance_n>,<retraction
velocity_n>])
```

Meaning

ESRR(...):	Function to write to the drive parameters for the ESR function "retract" The function: <ul style="list-style-type: none"> • Must be alone in the block. • Triggers a preprocessing stop. • Cannot be used in synchronized actions. 	
<code><axis_1>, ..., <axis_n>:</code>	Axis for which drive-integrated retraction should be configured For this axis, drive parameter p0888 (configuration) is written to in the drive: $p0888 = 2$	
	Type:	AXIS
	Range of values:	Channel axis identifier
<code><retraction distance_1>, ..., <retraction distance_n>:</code>	For the drive, the retraction distance is converted into a retraction speed. For the specified axis, the value is written to drive parameter p0893 (speed): $p0893 = (<retraction distance_n> \text{ converted into retraction speed})$	
	Unit:	mm/min, inch/min, degrees/min (depending on the unit of the axis)
	Type:	REAL
	Range of values:	MIN - MAX
<code><retraction velocity_1>, ..., <retraction velocity_n>:</code>	For the drive, the retraction velocity is converted into a time. For the specified axis, the value is written to drive parameter p0892 (timer) [s]: $p0892 = <retraction distance_n> / <retraction velocity_n>$	
	Unit:	mm/min, inch/min, degrees/min (depending on the unit of the axis)
	Type:	REAL
	Range of values:	0.00 - MAX
A maximum of 5 axes can be programmed in a function call; n = 5		

18.12 Define blank (WORKPIECE)

The controller must know the shape and size of a blank to be able to display it in the graphical simulation. The user therefore has the capability of defining blanks via the user interface or directly in the NC program. The definitions of blanks are retained beyond a (program end/channel/BAG) reset. They are automatically deleted the next time that the control system powers up.

Syntax

```
WORKPIECE("<WP>", "<RefP>", "<ZeroOffset>", "<Type>", <Par5>,
<Par6>, ..., <Par12>)
```

Meaning

WORKPIECE(...):		Predefined procedure for defining a blank	
		Preprocessing stop:	Yes
		Alone in the block:	Yes
Parameters:			
1	"<WP>":	Name of the workpiece (optional)	
		Data type:	STRING
		A specification is only necessary if there can be several workpieces in one channel. Without specifying, "WORKP<n>" is automatically accepted, with <n> being the number of the declaring channel.	
2	"<RefP>":	Clamping (optional, only for milling machines)	
		Data type:	STRING
		Range of values:	"Table" Clamping of the fixed table
			"A" Clamping on rotary axis A
			"B" Clamping on rotary axis B
			"C" Clamping on rotary axis C
		Precondition: The table or the rotary axis must be enabled via the corresponding machine data for the clamping of the blank (see SINUMERIK Operate Commissioning Manual).	
3	"<ZeroOffset>":	Settable work offset for positioning the blank (not programmable) The selection of a settable work offset for positioning the blank is only offered for the blank entry via the user interface. For the direct definition of the blank in the part program, the blank always relates to the currently valid work offset.	

18.12 Define blank (WORKPIECE)

4	<Type>":	Blank shape		
		Data type:	STRING	
		Range of values:	"CYLINDER":	Cylinder
			"PIPE":	Pipe
			"RECTANGLE":	Centered cuboid
			"BOX":	Cuboid
		"N_CORNER":	Polygon with n edges	
5 ... 12	<Par5> ... <Par12>:	Parameters for description of the blank shape		
		Data type:	REAL	
		The number of parameters required and their meaning depend on the respective blank shape and the value of the bit parameter. See: <ul style="list-style-type: none">• "Parameters for description of the blank shape" table• "Bit parameters" table		
WORPIECE () :		A WORKPIECE call without parameters deletes all blank definitions.		
WORPIECE (<WP>) :		A WORKPIECE call with workpiece name only deletes this blank definition.		

Table 18-1 Parameters for description of the blank shape

Blank shape	Parameter							
	<Par5>	<Par6>	<Par7>	<Par8>	<Par9>	<Par10>	<Par11>	<Par12>
Cylinder	Bit parameter Real value that is interpreted as bit-coded integer value. The bits define the meaning of the following parameters (see "Bit parameters" table).	Refer- ence point Z_0	Length Z_1	Mach- ing dimen- sion Z_B	Outer di- ameter d_0	-	Rotation about ro- tary axis	-
Pipe		Refer- ence point Z_0	Length Z_1	Mach- ing dimen- sion Z_B	Outer di- ameter d_0	Wall thick- ness (inc) / in- ner diame- ter d_1 (abs)	Rotation about ro- tary axis	-
Centered cuboid		Refer- ence point Z_0	Length Z_1	Mach- ing dimen- sion Z_B	Width W	Length L	Rotation about ro- tary axis	-
Cuboid		Refer- ence point Z_0	Length Z_1	Mach- ing dimen- sion Z_B	X_0	Y_0	X_1	Y_1
Polygon with n edges		Refer- ence point Z_0	Length Z_1	Mach- ing dimen- sion Z_B	Number of corners	Width across flats	Rotation about ro- tary axis	-

Table 18-2 Bit parameter

Bit	Meaning	
4 (0x0010)	Cuboid: X_1	
	= 0	inc
	= 1	abs
5 (0x0020)	Cuboid: Y_1	
	= 0	inc
	= 1	abs
6 (0x0040)	Length Z_1 (final dimension)	
	= 0	inc
	= 1	abs
Bit 7 (0x0080)	Machining dimension Z_B	
	= 0	inc
	= 1	abs
Bit 8 (0x0100)	Pipe: Wall thickness / inner diameter	
	= 0	inc
	= 1	abs
9 (0x0200)	Polygon with n edges	
	= 0	Width across flats
	= 1	Edge length
12 (0x1000)	Clamping for turning machines	
	= 0	Main spindle
	= 1	Counterspindle
13 (0x2000)	Counterspindle	
	= 0	with mirroring
	= 1	without mirroring

Examples

Example 1: Cylinder-shaped blank on a turning machine

Program code

Comment

...

18.12 Define blank (WORKPIECE)

Program code	Comment
WORKPIECE(,,, "CYLINDER",0,0,-200,-150,100)	; Blank definition:
	; Blank shape: Cylinder
	; Bit parameter=0(no bit set) → Values for length and machining dimension are incremental, blank on main spindle
	; Reference point(Z0)=0
	; Length(Z1)=-200
	; Machining dimension(ZB)=-150
	; Outer diameter(d0)=100
...	

Example 2: Pipe-shaped blank on a turning machine

Program code	Comment
...	
WORKPIECE(,,, "PIPE",256,0,-200,-150,100,80)	; Blank definition:
	; Blank shape: Pipe
	; Bit parameter=256(Bit8=1) → Inner diameter is absolute; length and machining dimension are incremental, blank on main spindle
	; Reference point(Z0)=0
	; Length(Z1)=-200
	; Machining dimension(ZB)=-150
	; Outer diameter(d0)=100
	; Inner diameter(d1)=80
...	

18.13 Switch language mode (G290, G291)

The controller gives you the capability of reading in part programs from external CNC systems and processing them. The prerequisite is that the corresponding NC language mode (ISO dialect) has been defined during commissioning.

Reference:

Function Manual ISO Dialects

The ISO dialect mode can be activated separately for each channel. For example, channel 1 can run in ISO dialect mode while channel 2 is active in SINUMERIK mode.

The switchover between SINUMERIK mode and ISO dialect mode is done in the NC program via the commands of the G-group 47. The active tool, tool compensation and work offsets are not influenced by the switchover.

Syntax

```
G291
...
G290
```

Meaning

G290:	Activate SINUMERIK language mode	
	Alone in the block:	Yes
	Effective:	Modal
G291:	Activate ISO language mode	
	Alone in the block:	Yes
	Effective:	Modal

Conditions

SINUMERIK mode

- The default of the G commands can be defined for each channel via machine data.
- No language commands from the ISO dialects can be programmed in SINUMERIK mode.

ISO dialect mode

- The ISO dialect mode can be set with machine data as the basic setting of the control system. In ISO dialect mode, the control system then reboots by default.
- Only G commands from the ISO dialect can be programmed. The programming of SINUMERIK G functions is not possible in ISO dialect mode.
- ISO dialect and SINUMERIK language cannot be mixed in the same NC block.
- G commands cannot be used to switch between ISO dialect M (milling) and ISO dialect T (turning).

18.13 Switch language mode (G290, G291)

- Subprograms that are programmed in SINUMERIK mode can be called.
- If SINUMERIK functions are to be used, a switchover to SINUMERIK mode must first be made (see example).

Example**Compression of linear blocks in the ISO dialect mode**

Program code	Comment
N5 G290	; Activate SINUMERIK language mode.
N10 COMPON	; COMPON is a command in the Siemens language and activates a compressor function that replaces the successive linear blocks with polynomial blocks with path lengths that are as long as possible.
N15 G291	; Activate ISO language mode.
N20 G01 X100 Y100 F1000	; Since COMPON has been activated in SINUMERIK mode, even linear blocks in the ISO dialect mode can be compressed with this function.
...	

User stock removal programs

19.1 Supporting functions for stock removal

Preprogrammed stock removal programs are provided for stock removal. Beyond this, you have the possibility of generating your own stock removal programs using the following listed functions:

- Generate contour table (CONTPRON)
- Generate coded contour table (CONTDCON)
- Deactivate contour preparation (EXECUTE)
- Determine point of intersection between two contour elements (INTERSEC)
(Only for tables that were generated using CONTPRON)
- Execute contour elements of a table block-by-block (EXECTAB)
(Only for tables that were generated using CONTPRON)
- Calculate circle data (CALCDAT)

Note

You can use these functions universally, not just for stock removal.

Requirements

The following must be done before calling the CONTPRON or CONTDCON functions:

- A starting point that permits collision-free machining must be approached.
- The cutting radius compensation must be deactivated with G40.

19.2 Generate contour table (CONTPRON)

CONTPRON switches on the contour preparation. The NC blocks that are subsequently called are not executed, but are split-up into individual movements and stored in the contour table. Each contour element corresponds to one row in the two-dimensional array of the contour table. The number of relief cuts is returned.

Syntax

Activate contour preparation:

```
CONTPRON(<contour table>,<machining type>,<relief cuts>,<machining direction>)
```

Deactivate contour preparation and return to the normal execution mode:

```
EXECUTE (<ERROR>)
```

See "Deactivate contour preparation (EXECUTE) (Page 695)"

Meaning

CONTPRON:	Predefined procedure to activate the contour preparation to generate a contour table		
<contour table>:	Name of contour table		
<machining type>:	Parameter for the machining type		
	Type:	CHAR	
	Value:	"G":	Longitudinal turning: Internal machining
		"L":	Longitudinal turning: External machining
		"N":	Face turning: Internal machining
		"P":	Face turning: External machining
<relief cuts>:	Result variable for the number of relief cut elements that occur		
	Type:	INT	
<machining direction>:	Parameters for the machining direction		
	Type:	INT	
	Value:	0	Contour preparation, forward (default value)
		1	Contour preparation in both directions

Example 1

Generating a contour table with:

- Name "KTAB"
- Max. 30 contour elements (circles, straight lines)
- One variable for the number of relief cut elements that occur
- One variable for error messages

**NC program:**

Program code	Comment
N10 DEF REAL KTAB[30,11]	; Contour table with the name KTAB and max. 30 contour elements, parameter value 11 (number of table columns) is a fixed quantity.
N20 DEF INT ANZHINT	; Variable for the number of relief cut elements with the name ANZHINT.
N30 DEF INT ERROR	; Variable for error feedback signal (0=no error, 1=error).
N40 G18	
N50 CONTPRON(KTAB,"G",ANZHINT)	; Activate contour preparation.
N60 G1 X150 Z20	; N60 to N120: Contour description
N70 X110 Z30	
N80 X50 RND=15	
N90 Z70	
N100 X40 Z85	
N110 X30 Z90	
N120 X0	
N130 EXECUTE(ERROR)	; End filling the contour table, switch-over to normal program mode.
N140 ...	; Continue to process the table.

Contour table KTAB:

Index Line	Column									
(0)	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
7	7	11	0	0	20	150	0	82.40535663	0	0

19.2 Generate contour table (CONTPRON)

0	2	11	20	150	30	110	-1111	104.0362435	0	0
1	3	11	30	110	30	65	0	90	0	0
2	4	13	30	65	45	50	0	180	45	65
3	5	11	45	50	70	50	0	0	0	0
4	6	11	70	50	85	40	0	146.3099325	0	0
5	7	11	85	40	90	30	0	116.5650512	0	0
6	0	11	90	30	90	0	0	90	0	0
0	0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0	0

Explanation of the column contents:

- (0) Pointer to next contour element (to the row number of that column)
- (1) Pointer to previous contour element
- (2) Coding the contour mode for motion
Possible values for X = abc
 $a = 10^2$ G90 = 0 G91 = 1
 $b = 10^1$ G70 = 0 G71 = 1
 $c = 10^0$ G0 = 0 G1 = 1 G2 = 2 G3 = 3
- (3), (4) Starting point of contour elements
(3) = abscissa, (4) = ordinate of the current plane
- (5), (6) Starting point of the contour elements
(5) = abscissa, (6) = ordinate of the current plane
- (7) Max/min indicator: Identifies local maximum and minimum values on the contour
- (8) Maximum value between contour element and abscissa (for longitudinal machining) or ordinate (for face cutting). The angle depends on the type of machining programmed.
- (9), (10) Center point coordinates of contour element, if it is a circle block.
(9) = abscissa, (10) = ordinate

Example 2

Generating a contour table with

- Name KTAB
- Max. 92 contour elements (circles, straight lines)
- Operating mode: Longitudinal turning, external machining
- Preparation, forward and backward

**NC program:**

Program code	Comment
N10 DEF REAL KTAB[92,11]	; Contour table with name KTAB and max. 92 contour elements, parameter value 11 is a fixed quantity.
N20 DEF CHAR BT="L"	; Mode for CONTPRON: Longitudinal turning, external machining
N30 DEF INT HE=0	; Number of relief cut elements=0
N40 DEF INT MODE=1	; Preparation, forward and backward
N50 DEF INT ERR=0	; Error feedback signal
...	
N100 G18 X100 Z100 F1000	
N105 CONTPRON(KTAB,BT,HE,MODE)	; Activate contour preparation.
N110 G1 G90 Z20 X20	
N120 X45	
N130 Z0	
N140 G2 Z-15 X30 K=AC(-15) I=AC(45)	
N150 G1 Z-30	
N160 X80	
N170 Z-40	
N180 EXECUTE(ERR)	; End filling the contour table, switch-over to normal program mode.
...	

19.2 Generate contour table (CONTPRON)

Contour table KTAB:

After contour preparation is finished, the contour is available in both directions.

Index	Column										
Line	(0)	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)

90	89	84	11	20	45	20	20	84	90	0	0
91	83 ⁹⁾	85 ¹⁰⁾	11	20	20	100	100	0	45	0	0

Explanation of column contents and comments for lines 0, 1, 6, 8, 83, 85 and 91

The explanations of the column contents given in example 1 apply.

Always in table line 0:

- 1) Predecessor: Line n contains the contour end (forward)
- 2) Successor: Line n is the contour table end (forward)

Once each within the contour elements forward:

- 3) Predecessor: Contour start (forward)
- 4) Successor: Contour end (forward)

Always in line contour table end (forward) +1:

- 5) Predecessor: Number of relief cuts (forward)
- 6) Successor: Number of relief cuts (backward)

Once each within the contour elements backward:

- 7) Successor: Contour end (backward)
- 8) Predecessor: Contour start (backward)

Always in last line of table:

- 9) Predecessor: Line n is the contour table start (backward)

10) Successor: Line n contains the contour start (backward)

Further information

Permitted traversing commands, coordinate system

The following G commands can be used for the contour programming:

- G group 1: G0, G1, G2, G3

In addition, the following are possible:

- Rounding and chamfer
- Circle programming using CIP and CT

The spline, polynomial and thread functions result in errors.

Changes to the coordinate system by activating a frame are not permissible between CONTPRON and EXECUTE. The same applies for a change between G70 and G71 or G700 and G710.

Replacing the geometry axes with GEOAX while preparing the contour table produces an alarm.

Relief cut elements

The contour description for the individual relief cut elements can be performed either in a subprogram or in individual blocks.

Stock removal independent of the programmed contour direction

The contour preparation with CONTPRON was expanded so that after it has been called, the contour table is available independent of the programmed direction.

19.3 Generate coded contour table (CONTDCON)

With the contour preparation activated with `CONTDCON`, the following NC blocks that are called are saved in a coded form in a 6-column contour table to optimize memory use. Each contour element corresponds to one row in the contour table. When familiar with the coding rules specified below, e.g. you can combine DIN code programs for cycles from the table lines. The data of the output point is saved in the table line with the number 0.

Syntax

Activate contour preparation:

```
CONTDCON(<contour table>,<machining direction>)
```

Deactivate contour preparation and return to the normal execution mode:

```
EXECUTE (<ERROR>)
```

See "Deactivate contour preparation (EXECUTE) (Page 695)"

Meaning

CONTDCON:	Predefined procedure to activate the contour preparation to generate a coded contour table		
<contour table>:	Name of the contour table		
<machining direction>:	Parameter for machining direction		
	Type:	INT	
	Value:	0	Contour preparation according to the sequence of contour blocks (default value)
		1	Not permissible

Note

The G commands permitted for `CONTDCON` in the program section to be included in the table are more comprehensive than for `CONTPRON`. Further, feedrates and feedrate type are saved for each contour section.

Example

Generating a contour table with:

- Name "KTAB"
- Contour elements (circles, straight lines)
- Operating mode: Turning
- Machining direction: Forward

**NC program:**

Program code	Comment
N10 DEF REAL KTAB[9,6]	;Contour table with name KTAB and 9 table cells. These allow 8 contour sets. The parameter value 6 (column number in table) is a fixed size.
N20 DEF INT MODE = 0	; Variable for the machining direction. Standard value 0: Only in the programmed direction of the contour.
N30 DEF INT ERROR = 0	; Variable for the error feedback signal.
...	
N100 G18 G64 G90 G94 G710	
N101 G1 Z100 X100 F1000	
N105 CONTDCON (KTAB, MODE)	; Contour preparation call (MODE can be omitted).
N110 G1 Z20 X20 F200	; Contour description.
N120 G9 X45 F300	
N130 Z0 F400	
N140 G2 Z-15 X30 K=AC(-15) I=AC(45) F100	
N150 G64 Z-30 F600

N170 Z-40 F800	
N180 EXECUTE(ERROR)	; End filling the contour table, switchover to normal program mode.
...	

19.3 Generate coded contour table (CONTDCON)

Contour table KTAB:

	Column index					
	0	1	2	3	4	5
Line index	Contour mode	End point abscissa	End point ordinate	Center point abscissa	Center point ordinate	Feedrate
0	30	100	100	0	0	7
1	11031	20	20	0	0	200
2	111031	20	45	0	0	300
3	11031	0	45	0	0	400
4	11032	-15	30	-15	45	100
5	11031	-30	30	0	0	600
6	11031	-30	80	0	0	700
7	11031	-40	80	0	0	800
8	0	0	0	0	0	0

Explanation of the column contents:

Line 0 Coding for the **starting point**:

Column 0: 10^0 (ones digit): G0 = 0
 10^1 (tens digit): G70 = 0, G71 = 1, G700 = 2, G710 = 3
Column 1: Starting point abscissa
Column 2: Starting point ordinate
Column 3-4: 0
Column 5: Line index of last contour piece in the table

Lines 1-n: Entries for **contour pieces**

Column 0: 10^0 (ones digit): G0 = 0, G1 = 1, G2 = 2, G3 = 3
 10^1 (tens digit): G70 = 0, G71 = 1, G700 = 2, G710 = 3
 10^2 (hundreds digit): G90 = 0, G91 = 1
 10^3 (thousands digit): G93 = 0, G94 = 1, G95 = 2, G96 = 3
 10^4 (ten thousands digit): G60 = 0, G44 = 1, G641 = 2, G642 = 3
 10^5 (hundred thousands digit): G9 = 1
Column 1: End point abscissa
Column 2: End point ordinate
Column 3: Center point abscissa for circular interpolation
Column 4: Center point ordinate for circular interpolation
Column 5: Feedrate

Further information

Permitted traversing commands, coordinate system

The following G groups and G commands can be used for the contour programming:

G group 1:	G0, G1, G2, G3
G group 10:	G60, G64, G641, G642
G group 11:	G9
G group 13:	G70, G71, G700, G710
G group 14:	G90, G91
G group 15:	G93, G94, G95, G96, G961

In addition, the following are possible:

- Rounding and chamfer
- Circle programming using CIP and CT

The spline, polynomial and thread functions result in errors.

Changes to the coordinate system by activating a frame are not permissible between CONTDCON and EXECUTE. The same applies for a change between G70 and G71 or G700 and G710.

Replacing the geometry axes with GEOAX while preparing the contour table produces an alarm.

Machining direction

The contour table generated using CONTDCON is used for stock removal in the programmed direction of the contour.

19.4 Determine point of intersection between two contour elements (INTERSEC)

INTERSEC determines the point of intersection of two normalized contour elements from the contour tables generated using CONTPRON.

Syntax

```
<Status>=INTERSEC(<contour table_1>[<contour element_1>],
<contour table_2>[<contour element_2>],<intersection
point>,<machining type>)
```

Meaning

INTERSEC:	Predefined function to determine the point of intersection between two contour elements from the contour tables generated with CONTPRON		
<Status>:	Variable for the point of intersection status		
	Type:	BOOL	
	Value:	TRUE	Point of intersection found
		FALSE	No intersection found
<contour table_1>:	Name of the first contour table		
<contour element_1>:	Number of the contour element of the first contour table		
<contour table_2>:	Names of the second contour table		
<contour element_2>:	Number of the contour element of the second contour table		
<point of intersection>:	Intersection coordinates in the active plane (G17 / G18 / G19)		
	Type:	REAL	
<machining type>:	Parameter for the machining type		
	Type:	INT	
	Value:	0	Point of intersection calculation in the active plane with parameter 2 (standard value)
		1	Point of intersection calculation independent of the transferred plane

Note

Please note that the variables must be defined before they are used.

The values defined with CONTPRON must be observed when transferring the contours:

Parameter	Meaning
2	Coding of contour mode for the movement
3	Contour start point abscissa
4	Contour start point ordinate
5	Contour end point abscissa
6	Contour end point ordinate

19.4 Determine point of intersection between two contour elements (INTERSEC)

Parameter	Meaning
9	Center point coordinates for abscissa (only for circle contour)
10	Center point coordinates for ordinate (only for circle contour)

Example

Calculate the intersection of contour element 3 in table TABNAME1 and contour element 7 in table TABNAME2. The intersection coordinates in the active plane are stored in the variables ISCOORD (1st element = abscissa, 2nd element = ordinate). If no intersection exists, the program jumps to NOCUT (no intersection found).

Program code	Comment
DEF REAL TABNAME1[12,11]	; Contour table 1
DEF REAL TABNAME2[10,11]	; Contour table 2
DEF REAL ISCOORD [2]	; Variable for the intersection coordinates.
DEF BOOL ISPOINT	; Variable for the intersection status.
DEF INT MODE	; Variable for the machining type.
...	
MODE=1	; Calculation independent of the active plane.
N10 ISPOINT=INTERSEC(TABNAME1[3],TABNAME2[7], ISCOORD,MODE)	; Intersection of the contour elements call.
N20 IF ISPOINT==FALSE GOTOF NOCUT	; Jump to NOCUT.
...	

19.5 Execute the contour elements of a table block-by-block (EXECTAB)

Using EXECTAB, you can execute the contour elements of a table – that were generated, e.g. with CONTPRON – block-by-block.

Syntax

```
EXECTAB(<contour table>[<contour element>])
```

Meaning

EXECTAB:	Predefined procedure to execute a contour element
<contour table>:	Name of the contour table
<contour element>:	Number of the contour element

Example

Contour elements 0 to 2 in table KTAB should be executed block-by-block.

Program code	Comment
N10 EXECTAB(KTAB[0])	; Traverse element 0 of table KTAB.
N20 EXECTAB(KTAB[1])	; Traverse element 1 of table KTAB.
N30 EXECTAB(KTAB[2])	; Traverse element 2 of table KTAB.

19.6 Calculate circle data (CALCDAT)

With **CALCDAT**, you can calculate the radius and the circle center point coordinates from the three or four points known along the circle. The specified points must be different.

Where four points do not lie directly on the circle an average value is formed for the circle center point and the radius.

Note

Calculation regulation for the averaging

The arc calculation is performed four times:

1. With circle points 1, 2, 3
2. With circle points 1, 2, 4
3. With circle points 1, 3, 4
4. With circle points 2, 3, 4

The values of the circle center point coordinates abscissa and ordinate are calculated by adding the abscissa and ordinate values of the four arc calculations and dividing by four.

The radius is calculated by forming the root from the sum of the four radii from the arc calculations and multiplying the result with 0.5.

Syntax

```
<Status>=CALCDAT(<circle points>[<number>,<type>],<number>,<result>)
```

Meaning

CALCDAT:	Predefined function to calculate the radius and center point coordinates of a circle from three or four points		
<Status>:	Variable for the circle calculation status		
	Type:	BOOL	
	Value:	TRUE	The specified points lie on a circle.
		FALSE	The specified points do not lie on a circle.
<circle points>[]:	Variable to specify the circle points using parameters		
	<number>:	Number of circle points (3 or 4)	
	<type>:	Type of coordinate data, e.g. 2 for 2-point coordinates	
<number>:	Parameter for the number of the points used for the calculation (3 or 4)		
<result>[3]:	Variable for result:		
	Circle center point coordinates and radius		
	0	Circle center point coordinate: Abscissa value	
	1	Circle center point coordinate: Ordinate value	
	2	Radius	

Note

Please note that the variables must be defined before they are used.

Example

Using three points it should be determined as to whether they are located on a circle segment.

Program code	Comment
N10 DEF REAL PT[3,2]=(20,50,50,40,65,20)	; Variable to specify the points of a circle.
N20 DEF REAL RES[3]	; Variable for result.
N30 DEF BOOL STATUS	; Variable for status.
N40 STATUS=CALCDAT(PKT,3,ERG)	; Call of the determined circle data.
N50 IF STATUS == FALSE GOTOF ERROR	; Jump to error.

19.7 Deactivate contour preparation (EXECUTE)

EXECUTE deactivates the contour preparation and at the same time the system returns to the normal execution mode.

Syntax

EXECUTE (<ERROR>)

Meaning

EXECUTE:	Predefined procedure to terminate contour preparation	
<ERROR>:	Variable for the error feedback signal	
	Type:	INT
	The value of the variable indicates whether the contour was able to be prepared error-free:	
	0	Error
	1	No error

Example

Program code

```
...  
N30 CONTPRON (...)  
N40 G1 X... Z...  
...  
N100 EXECUTE (...)  
...
```

Programming cycles externally

20.1 Technology cycles

20.1.1 Introduction

Contents

This section contains a description of the cycles for the turning, milling, and grinding technologies.

Structure

The description of a cycle is structured as follows:

- **Syntax**
Cycle name and call sequence of the transfer parameters
- **Parameters**
Tables to explain the individual parameters

Parameter description

The following data is specified in the table for a parameter: Name, description, value range, and dependencies on other parameters.

The column for reference to the parameter in the screen form is provided to more easily locate values programmed on the control when externally generated cycle calls are recompiled.

"For interface only" parameters

Certain parameters are marked "for interface only" in the table. These are not relevant to operation of the cycle. They are only needed in order to be able to recompile cycle calls completely. If they are not programmed the cycle can still be recompiled; the fields are then identified by color and must be completed in the mask.

"Reserved" parameters

Parameters that are described as "reserved" must be programmed with the value 0 or a comma so that the assignment of the following call parameters matches the internal cycle parameters. Exception: string parameters with the value "" or a comma.

Repeating cycles on a position pattern

Drilling and milling cycles can be repeated on the position pattern (modal calls). In such cases `MCALL` should be written in the same line before the cycle, e.g. `MCALL CYCLE83 (. . .)`.

Note

If certain transfer parameters (e.g. <_VARI>, <_GMODE>, <_DMODE>, <_AMODE>) have been indirectly programmed as parameters, the screen form is opened on recompiling but it cannot be stored as there is no unambiguous assignment to defined selection fields.

20.1.2 Technology-specific overview

The following overview table lists all available externally programmable technology cycles and the technology assigned to each of them:

Technology	Technology cycle
Drilling	<ul style="list-style-type: none"> • CYCLE81 - drilling, centering (Page 737) • CYCLE82 - drilling, counterboring (Page 738) • CYCLE85 - reaming (Page 747) • CYCLE86 - boring (Page 748) • CYCLE83 - deep-hole drilling (Page 741) • CYCLE830 - deep-hole drilling 2 (Page 771) • CYCLE84 - tapping without compensating chuck (Page 744) • CYCLE840 - tapping with compensating chuck (Page 780) • CYCLE78 - Drill thread milling (Page 733) • CYCLE802 - arbitrary positions (Page 769) • HOLES1 - row of holes (Page 700) • CYCLE801 - grid or frame (Page 767) • HOLES2 - hole circle (Page 700)
Turning	<ul style="list-style-type: none"> • CYCLE951 - stock removal (Page 791) • CYCLE930 - groove (Page 786) • CYCLE940 - undercut forms (Page 788) • CYCLE99 - thread turning (Page 757) • CYCLE98 - thread chain (Page 753) • CYCLE92 - cut-off (Page 749)
Contour turning	<ul style="list-style-type: none"> • CYCLE62 - contour call (Page 719) • CYCLE952 - contour grooving (Page 794)

Technology	Technology cycle
Milling	<ul style="list-style-type: none"> • CYCLE61 - Face milling (Page 717) • POCKET3 - milling a rectangular pocket (Page 702) • POCKET4 - milling a circular pocket (Page 705) • CYCLE76 - rectangular spigot milling (Page 729) • CYCLE77 - circular spigot milling (Page 731) • CYCLE79 - multi-edge (Page 735) • SLOT1 - longitudinal slot (Page 707) • SLOT2 - circumferential slot (Page 710) • CYCLE899 - Milling open slot (Page 783) • LONGHOLE - elongated hole (Page 712) • CYCLE70 - thread milling (Page 723) • CYCLE60 - engraving cycle (Page 714)
Contour milling	<ul style="list-style-type: none"> • CYCLE62 - contour call (Page 719) • CYCLE72 - Path milling (Page 725) • CYCLE63 - Milling contour pocket (Page 720) • CYCLE64 - Predrilling contour pocket (Page 722)
Grinding	<ul style="list-style-type: none"> • CYCLE495 - form-truing (Page 762) • CYCLE435 - Set dresser coordinate system (Page 762) • CYCLE4071 - longitudinal grinding with infeed at the reversal point (Page 800) • CYCLE4072 - longitudinal grinding with infeed at the reversal point and cancel signal (Page 801) • CYCLE4073 - longitudinal grinding with continuous infeed (Page 805) • CYCLE4074 - longitudinal grinding with continuous infeed and cancel signal (Page 806) • CYCLE4075 - surface grinding with infeed at the reversal point (Page 809) • CYCLE4077 - surface grinding with infeed at the reversal point and cancel signal (Page 812) • CYCLE4078 - surface grinding with continuous infeed (Page 815) • CYCLE4079 - surface grinding with intermittent infeed (Page 817)
Other	<ul style="list-style-type: none"> • CYCLE800 - swiveling (Page 764) • CYCLE832 - High-Speed Settings (Page 777)
All	<ul style="list-style-type: none"> • GROUP_BEGIN - beginning of program block (Page 819) • GROUP_END - end of program block (Page 820) • GROUP_ADDEND - End of trial cut addition (Page 820)

20.1.3 HOLES1 - row of holes

Syntax

HOLES1(<SPCA>, <SPCO>, <STA1>, <FDIS>, <DBH>, <NUM>, <_VARI>,
<_UMODE>, <_HIDE>, <_NSP>, <_DMODE>)

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning
1	X0	<SPCA>	REAL	Reference point for row of holes along the 1st axis (abs)
2	Y0	<SPCO>	REAL	Reference point for row of holes along the 2nd axis (abs)
3	α 0	<STA1>	REAL	Basic angle of rotation (angle to 1st axis)
4	L0	<FDIS>	REAL	Distance from 1st hole to reference point
5	L	<DBH>	REAL	Spacing between the holes
6	N	<NUM>	INT	Number of holes
7		<_VARI>	INT	Reserved
8		<_UMODE>	INT	Reserved
9		<_HIDE>	STRING [200]	Hidden positions <ul style="list-style-type: none"> Max. 198 characters Specification of consecutive position numbers, e.g. "1,3" (positions 1 and 3 are not executed)
10		<_NSP>	INT	Reserved
11		<_DMODE>	INT	Display mode
				<div> <div>UNITS:</div> <div> <div>Machining plane G17/18/19</div> <div> 0 = Compatibility, the plane effective before the cycle call remains active 1 = G17 (only active in the cycle) 2 = G18 (only active in the cycle) 3 = G19 (only active in the cycle) </div> </div> </div>

20.1.4 HOLES2 - hole circle

Syntax

HOLES2(<CPA>, <CPO>, <RAD>, <STA1>, <INDA>, <NUM>, <_VARI>,
<_UMODE>, <_HIDE>, <_NSP>, <_DMODE>)

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning				
1	X0	<CPA>	REAL	Center point for circle of holes along the 1st axis (abs) Reference point in the 1st axis			(for XY) (for XA, YB, ZC)	
2	Y0	<CPO>	REAL	Center point for circle of holes along the 2nd axis (abs) Reference point in the 2nd axis			(for XY) (for XA, YB, ZC)	
3	R	<RAD>	REAL	Radius of the circle of holes			(for XY)	
4	α0	<STA1>	REAL	Starting angle or 1st rotary axis position			(for XY) (for XA, YB, ZC)	
5	α1	<INDA>	REAL	Advance angle (for pitch circle only)			(for XY, XA, YB, ZC)	
					< 0 =	Clockwise		
					> 0 =	Counter-clockwise		
6	N	<NUM>	INT	Number of positions				
7		<_VARI>	INT	Machining type				
				UNITS:		Reserved		
				TENS:		Positioning type		
						0 =	Approach position - linear	
						1 =	Approach position - circular path	
				HUNDREDS:		Reserved		
				THOUSANDS:		Circular pattern		
						0 =	Compatibility mode, if INDA = 0 then full circle, INDA <> 0 then pitch circle	
						1 =	Full circle	
						2 =	Pitch circle	
				TEN THOUSANDS:		Position pattern with rotary axis		
						0 =	XY (without rotary axis)	(for XY)
						1 =	XA (X axis and rotary axis around X)	(only for XA)
						2 =	YB (Y axis and rotary axis around Y)	(only for YB)
						3 =	ZC (Z axis and rotary axis around C)	(only for ZC)
				ONE MILLION + HUNDRED THOUSANDS:		Offset (for several rotary axes around the same axis; if index too large, then 1st axis)		
						00 =	1. A, B or C axis	
						01 =	2. A, B or C axis	
						...		
						10 =	20. A, B or C axis	
8		<_UMODE>	INT	Reserved				

20.1 Technology cycles

No.	Parameter mask	Parameter internal	Data type	Meaning
9		<_HIDE>	STRING [200]	Reserved
10		<_NSP>	INT	Reserved
11		<_DMODE>	INT	Display mode
				UNITS:
				Machining plane G17/18/19
				0 = Compatibility, the plane effective before the cycle call remains active
				1 = G17 (only active in the cycle)
				2 = G18 (only active in the cycle)
				3 = G19 (only active in the cycle)

20.1.5 POCKET3 - milling a rectangular pocket

Syntax

```
POCKET3(<_RTP>, <_RFP>, <_SDIS>, <_DP>, <_LENG>, <_WID>, <_CRAD>,
<_PA>, <_PO>, <_STA>, <_MID>, <_FAL>, <_FALD>, <_FFP1>, <_FFD>,
<_CDIR>, <_VARI>, <_MIDA>, <_AP1>, <_AP2>, <_AD>, <_RAD1>, <_DP1>,
<_UMODE>, <_FS>, <_ZFS>, <_GMODE>, <_DMODE>, <_AMODE>)
```

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning
1	RP	<_RTP>	REAL	Retraction plane (abs)
2	Z0	<_RFP>	REAL	Reference point of tool axis (abs)
3	SC	<_SDIS>	REAL	Safety clearance (to be added to reference point, enter without sign)
4	Z1	<_DP>	REAL	Pocket depth (abs/inc), see <_AMODE>
5	L	<_LENG>	REAL	Pocket length (inc, to be entered with sign)
6	W	<_WID>	REAL	Pocket width (inc, to be entered with sign)
7	R	<_CRAD>	REAL	Corner radius of pocket
8	X0	<_PA>	REAL	Reference point 1st axis (abs)
9	YO	<_PO>	REAL	Reference point 2nd axis (abs)
10	α0	<_STA>	REAL	Angle of rotation, angle between longitudinal axis (L) and 1st axis
11	DZ	<_MID>	REAL	Maximum depth infeed
12	UXY	<_FAL>	REAL	Finishing allowance, plane
13	UZ	<_FALD>	REAL	Finishing allowance, depth
14	F	<_FFP1>	REAL	Feedrate in the plane
15	FZ	<_FFD>	REAL	Depth infeed rate

20.1.28 CYCLE95 - contour cutting

Syntax

CYCLE95 (<NPP>, <MID>, <FALZ>, <FALX>, <FAL>, <FF1>, <FF2>, <FF3>, <_VARI>, <DT>, <DAM>, <_VRT>, <_GMODE>, <_DMODE>)

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning
1	CON	<NPP>	STRING [140]	Contour name
2	D	<MID>	REAL	Maximum depth infeed during roughing, see <_GMODE>
3	UZ	<FALZ>	REAL	Finishing allowance in Z
4	UX	<FALX>	REAL	Finishing allowance in X
5	U	<FAL>	REAL	Finishing allowance parallel to contour (effective in both axes)
6	F	<FF1>	REAL	Feedrate for roughing
7	FY	<FF2>	REAL	Insertion feedrate, relief cuts
8	FS	<FF3>	REAL	Finishing feedrate

No.	Parameter mask	Parameter internal	Data type	Meaning
9		<_VARI>	INT	Machining type
				UNITS and TENS:
				1 = Roughing, longitudinal, external
				2 = Roughing, transverse, external
				3 = Roughing, longitudinal, internal
				4 = Roughing, transverse, internal
				5 = Finishing, longitudinal, external
				6 = Finishing, transverse, external
				7 = Finishing, longitudinal, internal
				8 = Finishing, transverse, internal
				9 = Complete machining, longitudinal, external
				10 = Complete machining, transverse, external
				11 = Complete machining, longitudinal, internal
				12 = Complete machining, transverse, internal
				HUNDREDS:
				0 = With rounding at the contour, without residual corners
				1 = Without rounding at the contour
				2 = Rounding only to previous intersection, residual corners can result
10	DT	<DT>	REAL	Dwell time at feed interruption
11	DI	<DAM>	REAL	Distance for feed interruptions
12	VRT	<_VRT>	REAL	Lift-off distance from the contour
				0 = A lift-off distance of 1 mm is used internally regardless of the active system (inch or metric)
				> 0 = Lift-off distance
13		<_GMODE>	INT	Geometrical mode (evaluation of programmed geometrical data)
				UNITS:
				Evaluation of the infeed depth
				0 = Infeed depth is calculated corresponding to the G group DIAMON/DIAMOF
				1 = Infeed depth acts as radius value (independent of DIAMON/DIAMOF)

No.	Parameter mask	Parameter internal	Data type	Meaning
14		<_DMODE>	INT	Display mode
				UNITS:
				Machining plane G17/G18/G19
				0 = Compatibility, the plane effective before the cycle call remains active
				1 = G17 (only active in the cycle)
				2 = G18 (only active in the cycle)
				3 = G19 (only active in the cycle)
				THOUSANDS:
				0 = Compatibility mode: Contour name is in NPP
				1 = Contour name is programmed in CYCLE62 and transferred to _SC_CONT_NAME

20.1.29 CYCLE98 - thread chain

Syntax

CYCLE98 (<_PO1>, <_DM1>, <_PO2>, <_DM2>, <_PO3>, <_DM3>, <_PO4>, <_DM4>, <APP>, <ROP>, <TDEP>, <FAL>, <_IANG>, <NSP>, <NRC>, <NID>, <_PP1>, <_PP2>, <_PP3>, <_VARI>, <_NUMTH>, <_VRT>, <_MID>, <_GDEP>, <_IFLANK>, <_PITA>, <_PITM1>, <_PITM2>, <_PITM3>, <_DMODE>, <_AMODE>)

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning
1	Z0	<_PO1>	REAL	Reference point in Z (abs)
2	X0	<_DM1>	REAL	Reference point in X (abs), in diameter
3	Z1	<_PO2>	REAL	Intermediate point 1 in Z (abs/inc), see <_AMODE> (UNITS)
4	X1	<_DM2>	REAL	Intermediate point 1 in X (abs/inc), see <_AMODE> (TENS) or
	X1α			Thread inclination 1 (-90° to 90°) abs is always diameter, inc is always radius
5	Z2	<_PO3>	REAL	Intermediate point 2 in Z, (abs/inc), see <_AMODE> (HUNDREDS)
6	X2	<_DM3>	REAL	Intermediate point 2 in X (abs/inc), see <_AMODE> (THOUSANDS) or
	X2α			Thread inclination 2 (-90° to 90°) abs is always diameter, inc is always radius
7	Z3	<_PO4>	REAL	End point in Z, (abs/inc), see <_AMODE> (TEN THOUSANDS)
8	X3	<_DM4>	REAL	End point in X, (abs/inc), see <_AMODE> (HUNDRED THOUSANDS) or
	X3α			Thread inclination 3 (-90° to 90°) abs is always diameter, inc is always radius
9	LW	<APP>	REAL	Thread run-in (inc, to be entered without sign)

No.	Parameter mask	Parameter internal	Data type	Meaning
10	LR	<ROP>	REAL	Thread run-out (inc, to be entered without sign)

				HUNDRED THOUSANDS:
				See direction parameter <_DIR>
				0 = Compatibility
				1 = Direction selection "Minus" optimized (only for user interface) ⁴⁾
				2 = Direction selection "Plus" optimized (only for user interface) ⁴⁾

No.	Parameter mask	Parameter internal	Data type	Meaning
4		<_MODE> ⁵⁾	INT	Swivel mode: Evaluation of swivel angle and swivel sequence (bit-coded)
				Bit: 7 6
				0 0: Swivel angle axis-by-axis -> see parameters <_A>, <_B>, <_C>
				0 1: Solid angle -> see parameters <_A>, <_B> ¹⁾
				1 0: Projection angle -> see parameters <_A>, <_B>, <_C> ¹⁾
				1 1: Direct rotary axis swivel mode -> see parameters <_A>, <_B> ¹⁾
				Bit: 5 4 3 2 1 0 (these do not apply to solid angles)
				x x x x 0 1 1st rotation _A around X
				x x x x 1 0 1st rotation _A around Y
				x x x x 1 1 1st rotation _A around Z
				x x 0 1 x x 2nd rotation _B around X
				x x 1 0 x x 2nd rotation _B around Y
				x x 1 1 x x 2nd rotation _B around Z
				0 1 x x x x 3rd rotation _C around X
				1 0 x x x x 3rd rotation _C around Y
				1 1 x x x x 3rd rotation _C around Z
5	X0	<_X0>	REAL	Reference point X prior to rotation
6	Y0	<_Y0>	REAL	Reference point Y prior to rotation
7	Z0	<_Z0>	REAL	Reference point Z prior to rotation
8	X(A)	<_A>	REAL	1st rotation acc. to setting in parameter <_MODE>
9	Y(B)	<_B>	REAL	2nd rotation acc. to setting in parameter <_MODE>
10	Z(C)	<_C>	REAL	3rd rotation acc. to setting in parameter <_MODE>
11	X1	<_X1>	REAL	Reference point X after rotation
12	Y1	<_Y1>	REAL	Reference point Y after rotation
13	Z1	<_Z1>	REAL	Reference point Z after rotation
14	- or +	<_DIR>	INT	Initiate travel of rotary axes (default = -1!)
				-1 = Position at smaller value of rotary axis 1 or 2 ²⁾
				+1 = Position at larger value of rotary axis 1 or 2 ²⁾
				0 = Do not swivel (merely calculate swivel frame) ^{1) 3)}
15	FR	<_FR_I>	REAL	Value (inc) of retraction in tool direction incremental

No.	Parameter mask	Parameter internal	Data type	Meaning
16		<_DMODE>	INT	Display mode
				UNITS:
				Machining plane G17/G18/G19
				0 = Compatibility, the plane effective before the cycle call remains active
				1 = G17 (only active in the cycle)
				2 = G18 (only active in the cycle)
				3 = G19 (only active in the cycle)
				TENS:
				Representation of the beta value during align tool
				0 = Value
				1 = Arrow

Note

If the following transfer parameters are programmed indirectly (as parameters), the screen form is not reset: <_FR>, <_ST>, <_TC>, <_MODE>, <_DIR>

¹⁾ Can be selected if the SWIVEL function is created in the commissioning

²⁾ Can be selected if direction reference to rotary axis 1 or 2 is set in IBN SWIVEL

If direction reference is "No" there is no selection field

³⁾ Swivel selection "No" can be grayed out SD 55221 Bit 0

Swivel "No", "Minus" direction corresponds to <_DIR> = 0 and _ST TEN THOUSANDS = 1

Swivel "No", "Plus" direction corresponds to <_DIR> = 0 and _ST TEN THOUSANDS = 2

⁴⁾ The direction selection for rotary axis 1 or 2 also occurs if the rotary axis with the direction reference is in the pole position (position value equals zero).

⁵⁾ Coding example: Axis-by-axis rotation, rotary sequence ZYX

Binary: 00011011 Decimal: 27

The axis identifiers XYZ correspond to the geometry axes of the NC channel. Individual rotations around the XYZ axes are permissible. For example, rotary sequence around ZXZ is not permitted in one call of CYCLE800

20.1.34 CYCLE801 - grid or frame

Syntax

```
CYCLE801 (<_SPCA>, <_SPCO>, <_STA>, <_DIS1>, <_DIS2>, <_NUM1>,
<_NUM2>, <_VARI>, <_UMODE>, <_ANG1>, <_ANG2>, <_HIDE>, <_NSP>,
<_DMODE>)
```

Parameters

No.	Parameter mask	Parameters internal	Data type	Meaning		
1	X0	< _SPCA>	REAL	Reference point for position pattern (grid/frame) along the 1st axis (abs)		
2	Y0	< _SPCO>	REAL	Reference point for position pattern (grid/frame) along the 2nd axis (abs)		
3	α0	< _STA>	REAL	Basic angle of rotation (angle to 1st axis)	< 0 =	Clockwise rotation
					> 0 =	Counterclockwise rotation
4	L1	< _DIS1>	REAL	Distance for columns (distance from the 1st axis, enter without sign)		
5	L2	< _DIS2>	REAL	Distance for rows (distance from the 2nd axis, enter without sign)

				2 = XY and rotary axis: XYA, XYB, XYC (1 rotary axis with 1st and 2nd geometry axis, without TRACYL)
				HUNDRED THOUSANDS:
				Rotary axis
				0 = Without rotary axis (only XY, compatibility)
				1 = A axis (rotary axis around X)
				2 = B axis (rotary axis around Y)
				3 = C axis (rotary axis around Z)
				TEN MILLIONS + ONE MILLION:
				Position pattern with rotary axis – offset (for several rotary axes around the same axis; if index too large, then 1st axis)
				00 = 1st A, B or C axis or for compatibility
				01 = 2nd A, B or C axis
				...
				19 = 20th A, B or C axis
22		<_UMODE>	INT	Selection of the spindle to be clamped: (Only for call from Jobshop) (Call of user cycle CUST_TECHCYC)
				3 = Clamp/release main spindle
				23 = Clamp/release counterspindle

No.	Parameter mask	Parameters internal	Data type	Meaning
23		<_DMODE>	INT	Display mode
				UNITS: Machining plane G17/G18/G19
				0 = Compatibility, the plane effective before the cycle call remains active
				1 = G17 (only active in the cycle)
				2 = G18 (only active in the cycle)
24		<S_ABA>	INT	Alternatives for all AB positions (9-digit decimal value) Number of digits: 876543210 (digit position corresponds to position ABn)
				Position value: 1 = Absolute (1st programmed position is always absolute)
				2 = Incremental
25	A0	<S_AB0>	REAL	1st rotary axis position for position pattern with rotary axis (in conjunction with <_VARI>))
26	A1	<S_AB1>	REAL	2nd rotary axis position for position pattern with rotary axis
27	A2	<S_AB2>	REAL	3rd rotary axis position for position pattern with rotary axis
28	A3	<S_AB3>	REAL	4th rotary axis position for position pattern with rotary axis
29	A4	<S_AB4>	REAL	5th rotary axis position for position pattern with rotary axis
30	A5	<S_AB5>	REAL	6th rotary axis position for position pattern with rotary axis
31	A6	<S_AB6>	REAL	7th rotary axis position for position pattern with rotary axis
32	A7	<S_AB7>	REAL	8th rotary axis position for position pattern with rotary axis
33	A8	<S_AB8>	REAL	9th rotary axis position for position pattern with rotary axis

Note

Positions that are not required for parameters X1/Y1/A1 to X8/Y8/A8 can be ignored. The alternative values for <_XA>, <_YA> and <S_ABA>, however, must be provided in full for all 9 positions.

For position pattern XA, YB or ZC (a geometry axis and rotary axis), the axis of the machining plane that is not traversed via the position pattern (Y for G17 and XA) must be positioned before the cycle call.

20.1.37 CYCLE832 - High-Speed Settings

Syntax

CYCLE832 (<S_TOL>, <S_TOLM>, <S_OTOL>)

Note

CYCLE832 does not relieve the machine manufacturer from optimization tasks that are necessary when commissioning the machine. This involves the optimization of the axes involved in the machining process and NCU settings (precontrol, jerk limiting, etc.).

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning																															
1	Tolerance	<S_TOL>	REAL	Contour tolerance The contour tolerance corresponds to the axis tolerance of the geometry axes.																															
2		<S_TOLM>	INT	<table><tr><td colspan="2">Machining type (technology)</td></tr><tr><td rowspan="5">UNITS:</td><td></td></tr><tr><td>0 =</td><td>Deselection</td></tr><tr><td>1 =</td><td>Finishing</td></tr><tr><td>2 =</td><td>Semi-finishing</td></tr><tr><td>3 =</td><td>Roughing</td></tr><tr><td rowspan="3">TENS:</td><td></td><td></td></tr><tr><td>0 =</td><td>Compatibility¹⁾ or no orientation tolerance</td></tr><tr><td>1 =</td><td>Orientation tolerance in parameter <S_OTOL></td></tr><tr><td>HUNDREDS ... TENS:																																			
	0 =	Compatibility ¹⁾ or no orientation tolerance																																	
	1 =	Orientation tolerance in parameter <S_OTOL>																																	
HUNDREDS ... HUNDRED THOUSANDS	Assigned for reasons of compatibility																																		
ONE MILLION:																																			
	0 =	Compatibility. The best available mold making function is automatically used: <ul style="list-style-type: none">Option Top Surface not active: <input type="checkbox"/> Advanced SurfaceOption Top Surface active: ⇒ Top Surface with smoothing																																	
	1 =	Top Surface without smoothing																																	
	2 =	Top Surface with smoothing																																	
3	ORI tolerance	<S_OTOL>	REAL	Orientation tolerance or version identifier CYCLE832 Tolerance parameter for the orientation of the workpiece. Is required when executing a high-speed machining program on machines with dynamic orientation transformation (e.g. 5-axis machining). Parameter <S_OTOL> must be programmed. This also applies for applications on 3-axis machines for programs without orientation of the tool (<S_OTOL> = 1).																															

¹⁾ Orientation tolerance derived from the contour tolerance multiplied by the factor from the cycle setting data SD55441 to SD55443.

References:

Commissioning Manual, Base Software and Operator Software; SINUMERIK Operate (IM9), Section "Configuring the High-Speed Settings function (CYCLE832)"

Plain text entry

To improve the readability of the cycle call, parameter <S_TOLM> (machining type) can also be entered in the plain text. Plain texts are independent of any language. The following entries are permitted:

_OFF	for	0	Deselection
_FINISH	for	1	Finishing
_SEMIFIN	for	2	Rough-finishing
_ROUGH	for	3	Roughing
_ORI_FINISH	for	11	Finishing with input of an orientation tolerance
_ORI_SEMIFIN	for	12	Finishing with input of an orientation tolerance
_ORI_ROUGH	for	13	Roughing with input of an orientation tolerance
_TOP_SURFACE_SMOOTH_OFF	for	1000000	Top Surface without smoothing
_TOP_SURFACE_SMOOTH_ON	for	2000000	Top Surface with smoothing

For plain text input for Top Surface, plain texts are combined as shown in the following example:

```
CYCLE832 (0.1, _TOP_SURFACE_SMOOTH_OFF+_ORI_FINISH, 1)
```

Note

The plain texts are based on the function names of the G group 59 (dynamic mode for path interpolation). With these plain texts, 3-axis machines and machines with multi-axis orientation transformation (TRAORI) are clearly separated in the application.

Deselecting CYCLE832

When CYCLE832 is deselected, parameter <S_TOL> must be transferred with zero.

Example: `CYCLE832 (0,0,1)`

The syntax `CYCLE832 ()` is also permitted for deselecting CYCLE832.

Examples**Example 1: CYCLE832 on 3-axis machine without orientation transformation****a) Cycle call with plain text input**

Program code	Comment
G710	; Dimension system is metric.
CYCLE832 (0.004, _FINISH, 1)	; CYCLE832 call with: Contour tolerance = 0.004 mm, machining type: Finishing
...	; Execution of a high-speed machining program

b) Cycle call without plain text input

Program code	Comment
G710	; See above
CYCLE832(0.004,1,1)	; See above
...	; See above

Example 2: CYCLE832 on 5-axis machine with orientation transformation

a) Cycle call and deselection with plain text input

Program code	Comment
G710	; Dimension system is metric.
TRAORI	; Activate orientation transformation.
CYCLE832(0.3,_ORI_ROUGH,0.8)	; CYCLE832 call with: Contour tolerance = 0.3 mm, machining type: Roughing with input of an orientation tolerance; orientation tolerance = 0.8 degrees
...	; Execution of a high-speed machining program
CYCLE832(0,_OFF,1)	; Contour tolerance = 0, machining type: Deselection of CYCLE832, orientation tolerance = 0 degrees

b) Cycle call and deselection without plain text input

Program code	Comment
G710	; See above
TRAORI	; See above
CYCLE832(0.3,13,0.8)	; See above
...	; See above
CYCLE832(0,0,1)	; See above

Parameters

No.	Parameter mask	Parameter internal	Data type	Meaning
1	X0	<_SPD>	REAL	Reference point in the plane axis (always diameter)
2	Z0	<_SPL>	REAL	Reference point along the longitudinal axis
3	B1	<_WIDG>	REAL	Width at bottom of groove
4	B2	<_WIDG2>	REAL	Width at top of groove (for interface only)
5	T1	<_DIAG>	REAL	Depth of groove at the reference point for abs and longitudinal machining = diameter, otherwise inc
6	T2	<_DIAG2>	REAL	Groove depth opposite the reference point (for interface only), for abs and longitudinal machining = diameter, otherwise inc
7	$\alpha 0$	<_STA>	REAL	Angle of inclination ($-180 \leq \text{<_STA>} \leq 180$)
8	$\alpha 1$	<_ANG1>	REAL	Side angle 1 ($0 \leq \text{<_ANG1>} < 90$) at the side of the groove determined by the reference point
9	$\alpha 2$	<_ANG2>	REAL	Side angle 2 ($0 \leq \text{<_ANG2>} < 90$) opposite the reference point
10	R1/FS1	<_RCO1>	REAL	Rounding radius or chamfer width 1, external at the reference point
11	R2/FS2	<_RCI1>	REAL	Rounding radius or chamfer width 2, internal at the reference point
12	R3/FS3	<_RCI2>	REAL	Rounding radius or chamfer width 3, internal opposite the reference point
13	R4/FS4	<_RCO2>	REAL	Rounding radius or chamfer width 4, external opposite the reference point
14	U	<_FAL>	REAL	Finishing allowance in X and Z, see <_VARI> (TEN THOUSANDS) (to be entered without sign)
15	D	<_IDEP1>	REAL	Maximum depth infeed on insertion (enter without sign)
				0 = 1. Cut directly to full depth
				> 0 = 1. Cut <_IDEP1>, 2nd cut $2 \cdot \text{<_IDEP1>}$, etc.
16	SC	<_SDIS>	REAL	Safety clearance (enter without sign)

20.1.41 CYCLE940 - undercut forms

Various undercuts can be programmed using the CYCLE940 cycle. In some cases, these differ significantly regarding the parameterization.

The additional columns in the table indicate which parameters are required for which undercut type. They correspond to the vertical selection softkeys in the cycle screen form:

- E: Undercut form E
- F: Undercut form F

- A-D: DIN thread undercut (forms A-D)
- T: Thread undercut (free definition of form)

Syntax

CYCLE940 (<_SPD>, <_SPL>, <_FORM>, <_LAGE>, <_SDIS>, <_FFP>, <_VARI>, <_EPD>, <_EPL>, <_R1>, <_R2>, <_STA>, <_VRT>, <_MID>, <_FAL>, <_FALX>, <_FALZ>, <_PITI>, <_PTAB>, <_PTABA>, <_DMODE>, <_AMODE>)

Parameters

No .	Parameter mask	Parameter internal	Data type	Prog. for form				Meaning			
				E	F	A-D	T				
1	X0	<_SPD>	REAL	x	x	x	x	Reference point in the plane axis (always diameter)			
2	Z0	<_SPL>	REAL	x	x	x	x	Reference point on longitudinal axis (abs)			
3	FORM	<_FORM>	CHAR	x	x	x	x	Form of undercut (capital letters, e.g. "T") Selection, table from which the undercut values should be taken			
									A =	External, reference DIN76, A = normal	
									B =	External, reference DIN76, B = short	
									C =	Internal, reference DIN76, C = normal	
									D =	Internal, reference DIN76, D = short	
									E =	Reference DIN509	
									F =	Reference DIN509	
									T=	Free-form	
4	POSITION	<_LAGE>	INT	x	x	x	x	Position of undercut (parallel Z)	0 =	External +Z: ____	
									1 =	External -Z: ____/	
									2 =	Internal +Z: /-----	
									3 =	Internal -Z: -----\	
5	SC	<_SDIS>		x	x	x	x	Safety clearance (inc)			
6	F	<_FFP>		x	x	x	x	Machining feedrate (mm/rev)			
7		<_VARI>	INT	-	-	x	x	Machining type			
									UNITS:	Machining	
										1 =	Roughing
									2 =	Finishing	
									3 =	Roughing + finishing	
									TENS:	Machining strategy	
										0 =	Parallel to the contour
										1 =	Longitudinal
Undercut forms E and F are always machined in a single pass like finishing.

20.1.44 CYCLE4071 - longitudinal grinding with infeed at the reversal point

Syntax

```
CYCLE4071(<S_A>, <S_B>, <S_W>, <S_U>, <S_I>, <S_K>, <S_H>, <S_A1>, <S_A2>)
```

Parameters

No.	Parameter	Data type	Meaning
1	<S_A>	REAL	Infeed depth at the start
2	<S_B>	REAL	Infeed depth at the end
3	<S_W>	REAL	Grinding width
4	<S_U>	REAL	Sparking-out time
5	<S_I>	REAL	Feedrate for infeed
6	<S_K>	REAL	Feedrate for transverse infeed
7	<S_H>	INT	Number of repetitions
8	<S_A1>	AXIS	Infeed axis (optional) or 1st geometry axis
9	<S_A2>	AXIS	Oscillating axis (optional) or 2nd geometry axis

Function

The cycle is used for the execution of <S_H> infeeds. The infeed depth at the start and at the end can be different. There is a tangential motion between the infeeds.

Sequence

1. Start of the cycle at the current position of the oscillating axis.
2. Traversing of the infeed axis to the infeed depth at the start P1 <S_A> with the feedrate for infeed P5 <S_I>.
3. Sparking out with the sparking-out time P4 <S_U>.
4. Traversing of the oscillating axis with the grinding width P3 <S_W> as travel path and the feedrate for transverse infeed P6 <S_K>.
5. Traversing of the infeed axis to the infeed depth at the end P2 <S_B> with the feedrate for infeed P5 <S_I>.
6. Sparking out with the sparking-out time P4 <S_U>.
7. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path to the starting point and the feedrate for transverse infeed P6 <S_K>.

The sequence cannot be interrupted with a single block.

The sequence is repeated according to the number of programmed repetitions P7 (<S_H>).

Example

Executing two oscillating motions with the following cycle parameters:

- Infeed depth at the start: 0.02 mm
- Infeed depth at the end: 0.01 mm
- Stroke: 100 mm
- Sparking-out time: 1 s
- Infeed feedrate: 1 mm/min
- Transverse feedrate: 1000 mm/min
- Repetitions: 2
- Oscillating and infeed axes: Standard geometry axes

Program code

```
N10 T1 D1
N20 CYCLE4071 (0.02,0.01,100,1,1,1000,2)
N30 M30
```

20.1.45 CYCLE4072 - longitudinal grinding with infeed at the reversal point and cancel signal

Syntax

```
CYCLE4072 (<S_GAUGE>, <S_A>, <S_B>, <S_W>, <S_U>, <S_I>, <S_K>,
<S_H>, <S_A1>, <S_A2>)
```

Parameters

No.	Parameter	Data type	Meaning
1	<S_GAUGE>	STRING	Cancel conditions for infeed: 1. Number of a rapid input 2. Logical expression
2	<S_A>	REAL	Infeed depth at the start
3	<S_B>	REAL	Infeed depth at the end
4	<S_W>	REAL	Grinding width
5	<S_U>	REAL	Sparking-out time
6	<S_I>	REAL	Feedrate for infeed
7	<S_K>	REAL	Feedrate for transverse infeed
8	<S_H>	INT	Number of repetitions
9	<S_A1>	AXIS	Infeed axis (optional) or 1st geometry axis
10	<S_A2>	AXIS	Oscillating axis (optional) or 2nd geometry axis

Function

The cycle is used for the execution of <S_H> infeeds taking into account an external cancel signal. The infeed depth can be different at the start and at the end. There is a tangential motion between the infeeds. The depth infeed is cancelled when the cancel condition is satisfied. A complete stroke is always performed after the cancellation of the depth infeed.

Sequence

1. Start of the cycle at the current position of the oscillating axis.
2. Traversing of the infeed axis to the infeed depth at the start P2 <S_A> with the feedrate for infeed P6 <S_I>.
3. Sparking out with the sparking-out time P5 <S_U>.
4. Traversing of the oscillating axis with the grinding width P4 <S_W> as travel path and the feedrate for transverse infeed P7 <S_K>.
5. Traversing of the infeed axis to the infeed depth at the end P3 <S_B> with the feedrate for infeed P6 <S_I>.
6. Sparking out with the sparking-out time P5 <S_U>.
7. Traversing of the oscillating axis with the grinding width P4 <S_W> as travel path to the starting point and the feedrate for transverse infeed P7 <S_K>.
8. Without cancellation: The sequence described above is repeated until the number of programmed repetitions P7 (<S_H>) is reached.
With cancellation: The machining is stopped when the next start point is reached.

The sequence cannot be interrupted by a single block.

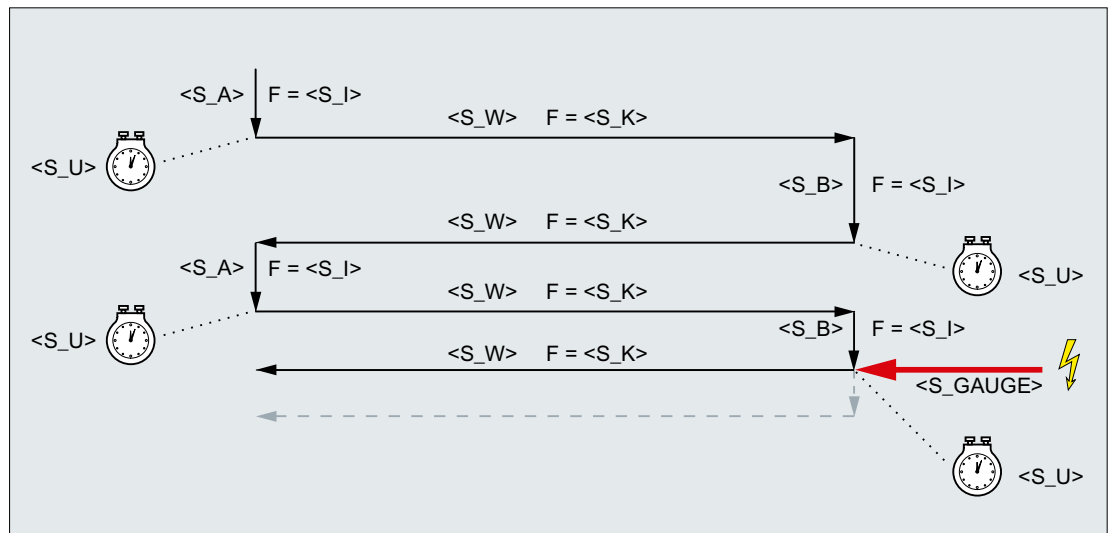

Figure 20-1 Cancellation of the infeed at the end

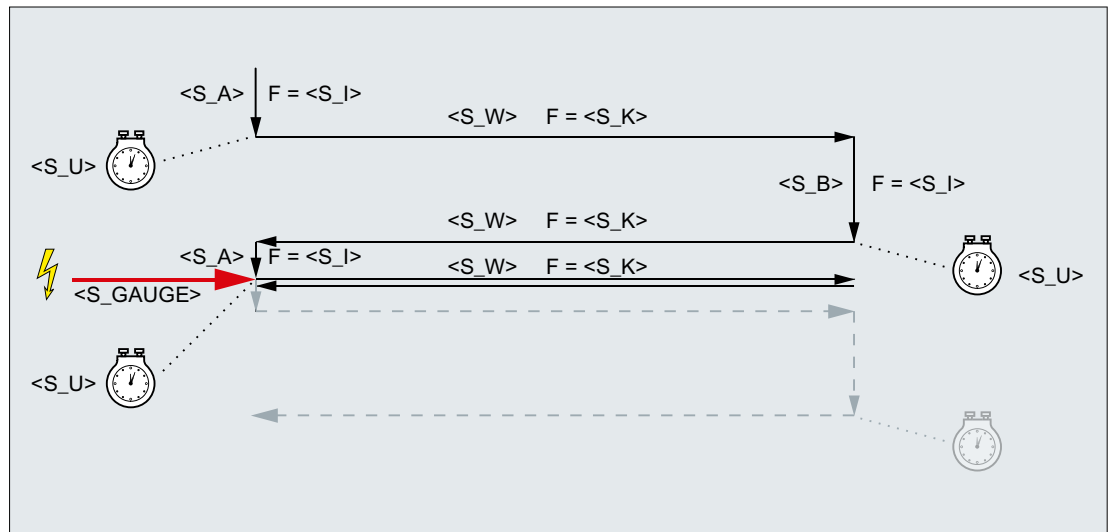

Figure 20-2 Cancellation of the infeed at the start

Resources

As resources, the cycle uses a block-wide synchronized action and a synchronized action variable. The synchronized action is determined dynamically from the free area of the synchronized action range (CUS.DIR - 1 ..., CMA.DIR - 1000 ..., CST.DIR - 1199 ...). SYG_IS[1] is used as the synchronized action variable.

Examples

Example 1: Oscillation with two strokes:

Cycle parameters

- Infeed depth at the start: 0.02 mm
- Infeed depth at the end: 0.01 mm
- Stroke: 100 mm
- Sparking-out time: 1 s
- Infeed feedrate: 1 mm/min
- Transverse feedrate: 1000 mm/min
- Repetitions: 2
- Oscillating and infeed axes: Standard geometry axes

Cancel signal Rapid input 1 (\$A_IN[1])

Program code

```
N10 T1 D1
N20 CYCLE4072 ("1",0.02,0.01,100,1,1,1000,2)
N30 M30
```

Example 2: Oscillation with two strokes:

Cycle parameters

- Infeed depth at the start: 0.02 mm
- Infeed depth at the end: 0.01 mm
- Stroke: 100 mm
- Sparking-out time: 1 s
- Infeed feedrate: 1 mm/min
- Transverse feedrate: 1000 mm/min
- Repetitions: 2
- Oscillating and infeed axes: Standard geometry axes

Cancel signal Variable \$A_DBR[20] < 0.01

Program code

```
N10 T1 D1
N20 CYCLE4072 ("($A_DBR[20]<0.01)",0.02,0.01,100,1,1,1000,2)
N30 M30
```

20.1.46 CYCLE4073 - longitudinal grinding with continuous infeed

Syntax

CYCLE4073 (<S_A>, <S_B>, <S_W>, <S_U>, <S_K>, <S_H>, <S_A1>, <S_A2>)

Parameters

No.	Parameter	Data type	Meaning
1	<S_A>	REAL	Infeed depth at the start
2	<S_B>	REAL	Infeed depth at the end
3	<S_W>	REAL	Grinding width
4	<S_U>	REAL	Sparking-out time
5	<S_K>	REAL	Feedrate for transverse infeed
6	<S_H>	INT	Number of repetitions
7	<S_A1>	AXIS	Infeed axis (optional) or 1st geometry axis
8	<S_A2>	AXIS	Oscillating axis (optional) or 2nd geometry axis

Function

The cycle is used for the execution of <S_H> infeeds. The infeed from the start to the end and from the end to the start can be different.

Sequence

1. Start of the cycle at the current position of the oscillating axis with infeed depth 0
2. Traversing of the oscillating axis with the grinding width P3 <S_W> as travel path and feedrate for transverse infeed P5 <S_K> with continuous increase in the infeed depth up to the infeed depth at the start P1 <S_A>.
3. Sparking out with the sparking-out time P4 <S_U>.
4. Traversing of the oscillating axis with the grinding width P3 <S_W> as travel path to the starting point and feedrate for transverse infeed P5 <S_K> with continuous increase in the infeed depth up to the infeed depth at the end P2 <S_B>.
5. Sparking out with the sparking-out time P4 <S_U>.

The sequence cannot be interrupted by a single block.

The sequence is repeated according to the number of programmed repetitions P7 (<S_H>).

Example

Oscillation with two strokes:

Cycle parameters

- Infeed depth at the start: 0.02 mm
- Infeed depth at the end: 0.01 mm
- Stroke: 100 mm
- Sparking-out time: 1 s
- Transverse feedrate: 1000 mm/min
- Repetitions: 2
- Oscillating and infeed axes: Standard geometry axes

Program code

```
N10 T1 D1
N20 CYCLE4073(0.02,0.01,100,1,1000,2)
N30 M30
```

20.1.47 CYCLE4074 - longitudinal grinding with continuous infeed and cancel signal

Syntax

```
CYCLE4074(<S_GAUGE>, <S_A>, <S_B>, <S_W>, <S_U>, <S_K>, <S_H>,
<S_A1>, <S_A2>)
```

Parameters

No.	Parameter	Data type	Meaning
1	<S_GAUGE>	STRING	Cancel conditions for infeed: 1. Number of a rapid input 2. Logical expression
2	<S_A>	REAL	Infeed depth at the start
3	<S_B>	REAL	Infeed depth at the end
4	<S_W>	REAL	Grinding width
5	<S_U>	REAL	Sparking-out time
6	<S_K>	REAL	Feedrate for transverse infeed
7	<S_H>	INT	Number of repetitions
8	<S_A1>	AXIS	Infeed axis (optional) or 1st geometry axis
9	<S_A2>	AXIS	Oscillating axis (optional) or 2nd geometry axis

Function

The cycle is used for the execution of <S_H> infeeds taking into account an external cancel signal, for example. The infeed depth can be different at the start and at the end. The depth infeed is cancelled when the cancel condition is satisfied. A complete stroke is always performed after the cancellation of the depth infeed.

Sequence

1. Start of the cycle at the current position of the oscillating axis with infeed depth 0
2. Traversing of the oscillating axis with the grinding width P4 <S_W> as travel path and feedrate for transverse infeed P6 <S_K> with continuous increase in the infeed depth up to the infeed depth at the start P2 <S_A>.
3. Sparking out with the sparking-out time P5 <S_U>.
4. Traversing of the oscillating axis with the grinding width P4 <S_W> as travel path to the starting point and feedrate for transverse infeed P6 <S_K> with continuous increase in the infeed depth up to the infeed depth at the end P3 <S_B>.
5. Sparking out with the sparking-out time P5 <S_U>.
6. Without cancellation: The sequence described above is repeated until the number of programmed repetitions P7 (<S_H>) is reached.
With cancellation: The depth infeed is cancelled. The machining is stopped when the next start point is reached.

The sequence cannot be interrupted by a single block.

Figure 20-3 Cancellation of the infeed from the end to the start

```

20.1.48 CYCLE4075 - surface grinding with infeed at the reversal point

Syntax

```
CYCLE4075(<S_I>, <S_J>, <S_K>, <S_A>, <S_R>, <S_F>, <S_P>, <S_A1>,
<S_A2>)
```

Parameters

No.	Parameter	Data type	Meaning
1	<S_I>	REAL	Infeed depth at the start
2	<S_J>	REAL	Infeed depth at the end

No.	Parameter	Data type	Meaning
3	<S_K>	REAL	Total infeed depth
4	<S_A>	REAL	Grinding width
5	<S_R>	REAL	Feedrate for infeed
6	<S_F>	REAL	Feedrate for transverse infeed
7	<S_P>	REAL	Sparking-out time
8	<S_A1>	AXIS	Infeed axis (optional)
9	<S_A2>	AXIS	Oscillating axis (optional)

Function

The cycle is used for machining with a total infeed depth P3 <S_K> in infeed steps. The infeed depths at the start P1 <S_I> and at the end P2 <S_J> can be different. There is a tangential motion between the infeeds.

The positional data P1 to P4 can be negative or positive.

The specification of the infeed axis P8 <S_A1> and/or oscillating axis P9 <S_A2> are optional. If one or both parameters are not specified, the cycle uses the first two geometry axes of the channel.

If the sum of the infeed depth at the start P1 <S_I> and at the end P2 <S_J> is 0 or the total infeed depth P3 <S_K> is 0, only a sparking-out stroke is performed.

Sequence

1. Start of the cycle at the current position of the oscillating axis.
2. Traversing of the infeed axis to the infeed depth at the start P1 <S_I> with the feedrate for infeed P5 <S_R>.
3. Sparking out with the sparking-out time P7 <S_P>.
4. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path and the feedrate for transverse infeed P6 <S_F>.
5. Traversing of the infeed axis to the infeed depth at the end P2 <S_J> with the feedrate for infeed P5 <S_R>.
6. Sparking out with the sparking-out time P7 <S_P>.
7. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path to the starting point and the feedrate for transverse infeed P6 <S_F>.

The sequence cannot be interrupted with a single block.

The sequence is repeated until the total infeed depth P3 <S_K> has been reached. The last stroke is then distributed unevenly.

Figure 20-5 Total infeed depth reached with infeed at the second reversal point

Figure 20-6 Total infeed depth reached with infeed at the first reversal point

Example

Oscillation with:

- 0.02 mm infeed depth at the start
- 0.01mm infeed depth at the end
- Total infeed depth 1 mm
- 100 mm stroke
- Infeed feedrate 1 mm/min
- Transverse feedrate 1000 mm/min
- 1 second sparking-out time
- Standard geometry axes

Program code

```

20.1.49 CYCLE4077 - surface grinding with infeed at the reversal point and cancel signal

Syntax

```
CYCLE4077(<S_GAUGE>, <S_I>, <S_J>, <S_K>, <S_A>, <S_R>, <S_F>,
<S_P>, <S_A1>, <S_A2>)
```

Parameters

No.	Parameter	Data type	Meaning
1	<S_GAUGE>	STRING	Cancel condition for infeed: <ul style="list-style-type: none"> • Number of a rapid input • Logical expression
2	<S_I>	REAL	Infeed depth at the start
3	<S_J>	REAL	Infeed depth at the end
4	<S_K>	REAL	Total infeed depth
5	<S_A>	REAL	Grinding width
6	<S_R>	REAL	Feedrate for infeed
7	<S_F>	REAL	Feedrate for transverse infeed
8	<S_P>	REAL	Sparking-out time
9	<S_A1>	AXIS	Infeed axis (optional)
10	<S_A2>	AXIS	Oscillating axis (optional)

Function

The cycle is used for machining with a total infeed depth P4 <S_K> in infeed steps. The infeed depths at the start P2 <S_I> and at the end P3 <S_J> can be different. There is a tangential motion between the infeeds. The depth infeed is cancelled when the cancel signal of the rapid input is 1 or the cancel condition is satisfied. A complete stroke is performed after the cancellation.

The positional data P2 to P5 can be negative or positive.

The specification of the infeed axis P9 <S_A1> and/or oscillating axis P10 <S_A2> are optional. If one or both parameters are not specified, the cycle uses the first two geometry axes of the channel.

If the sum of the infeed depth at the start P2 <S_I> and at the end P3 <S_J> is 0 or the total infeed depth P4 <S_K> is 0, only a sparking-out stroke is performed.

Figure 20-8 Cancellation of the infeed at the start

Resources

As resources, the cycle uses a block-wide synchronized action and a synchronized action variable. The synchronized action is determined dynamically from the free area of the synchronized action range (CUS.DIR - 1 ..., CMA.DIR - 1000 ..., CST.DIR - 1199 ...). SYG_IS[1] is used as the synchronized action variable.

20.1.50 CYCLE4078 - surface grinding with continuous infeed**Syntax**

CYCLE4078 (<S_I>, <S_J>, <S_K>, <S_A>, <S_F>, <S_P>, <S_A1>, <S_A2>)

Parameters

No.	Parameter	Data type	Meaning
1	<S_I>	REAL	Infeed depth from the start to the end
2	<S_J>	REAL	Infeed depth from the end to the start
3	<S_K>	REAL	Total infeed depth
4	<S_A>	REAL	Grinding width
5	<S_F>	REAL	Feedrate
6	<S_P>	REAL	Sparking-out time
7	<S_A1>	AXIS	Infeed axis (optional)
8	<S_A2>	AXIS	Oscillating axis (optional)

Function

The cycle is used for machining with a total infeed depth P3 <S_K> by means of continuous infeed. The infeed depths from the start to the end P1 <S_I> and from the end to the start P2 <S_J> can be different.

The positional data P1 to P4 can be negative or positive.

The specification of the infeed axis P8 <S_A1> and/or oscillating axis P9 <S_A2> are optional. If one or both parameters are not specified, the cycle uses the first two geometry axes of the channel.

If the sum of the infeed depths P1 <S_I> and P2 <S_J> is 0 or the total infeed depth P3 <S_K> is 0, only a sparking-out stroke is performed.

Sequence

1. Start of the cycle at the current position of the oscillating axis with infeed depth 0
2. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path and feedrate P5 <S_F> with continuous increase in the infeed depth up to the infeed depth at the start P1 <S_I>.
3. Sparking out with the sparking-out time P7 <S_P>.
4. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path to the starting point and feedrate P5 <S_F> with continuous increase in the infeed depth up to the infeed depth at the end P2 <S_J>.
5. Sparking out with the sparking-out time P7 <S_P>.
6. Traversing of the oscillating axis with the grinding width P4 <S_A> as travel path to the starting point and feedrate P5 <S_F>.

The sequence cannot be interrupted with a single block.

The sequence is repeated until the total infeed depth P3 <S_K> has been reached. The last stroke is then distributed unevenly.

Example

Oscillation with:

- 20 mm infeed depth at the start
- 10 mm infeed depth at the end
- Total infeed depth 100 mm
- 100 mm stroke

- Feedrate 1000 mm/min
- 1 second sparking-out time
- Standard geometry axes

				2 = Counterspindle

20.1.55 Supplementary conditions

20.1.55.1 Technology scaling in cycle screen forms

When the technology scaling is active, the simplified input can be selected for various cycle screen forms, in which only the most important cycle parameters are displayed

For example, the simplified input can be selected for the following cycle screen forms:

Technology	Cycle screen form
Drilling	Deep-hole drilling
	Tapping
Milling	Rectangular pocket
	Contour milling: Pocket
Turning	Thread turning: Longitudinal
	Contour turning: Stock removal
	Contour turning: Grooving
	Contour turning: Groove turning

In the user interface of the relevant cycle screen forms, the options "Input: **Simple**" and "Input: **Complete**" are available.

Cycle parameters that are not displayed

The cycle parameters that are not displayed in the simplified input are pre-assigned fixed, technologically useful, but not variable values. Or the cycle parameters are assigned parameterizable values via the channel-specific cycle setting data. See the paragraph below "Commissioning" > "Channel-specific cycle setting data"

Switchover from "Input: Complete" > "Input: Simple"

If a cycle screen form is filled in with the setting "Input complete" and then switched to "Input simple", the default or setting data values are used for the parameters no longer displayed when generating the cycle call.

Commissioning

Channel-specific configuration machine data

The technology scaling in cycle screen forms can be activated with the machine data:

MD52210 \$MCS_FUNCTION_MASK_DISP, bit 9 = 1 (select display "Input simple")

Channel-specific cycle setting data

If the simplified input in cycle screen forms is active, the values for certain cycle parameters can be specified via the following setting data:

Number	Identifier	Meaning
SD55300	\$SCS_EASY_SAFETY_CLEARANCE	Safety clearance
SD55301	\$SCS_EASY_DWELL_TIME	Dwell time
SD55305	\$SCS_EASY_DRILL_DEEP_FD1	Deep-hole drilling: Percentage: 1st feedrate
SD55306	\$SCS_EASY_DRILL_DEEP_DF	Deep-hole drilling: Percentage: Infeed
SD55307	\$SCS_EASY_DRILL_DEEP_V1	Deep-hole drilling: Minimum depth infeed
SD55308	\$SCS_EASY_DRILL_DEEP_V2	Deep-hole drilling: Retraction distance
SD55309	\$SCS_EASY_THREAD_RETURN_DIST	Thread turning: Return distance

20.2 Measuring cycles

Measuring cycles are special subprograms provided by Siemens to solve certain measuring tasks. As with cycles in general, measuring cycles can also be adapted to specific problems via parameter settings.

Measuring cycles are available in the following areas and technologies:

- Tool measurements, turning/milling
- Workpiece measurements, turning/milling

References

For a detailed description of the measuring cycles, refer to:

Measuring Cycles Programming Manual

Tables

21.1 Operations

Note

Cycles

The list of operations contains all cycles, which occur in the NC program (G code), i.e. can be programmed in the program editor using masks - or must be programmed for loops without programming support. Cycles, which for reasons of compatibility, are still available in the control, however can no longer be edited using the SINUMERIK Operate program editor ("compatibility cycles") are not taken into account.

Operations A ... C

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾

-	O	Operator for subtraction		+		PGAsl
<	O	Comparison operator, less than		+		PGAsl
<<	O	Concatenation operator for strings		+		PGAsl
<=	O	Comparison operator, less than or equal to		+		PGAsl
=	O	Assignment operator		+		PGAsl
>=	O	Comparison operator, greater than or equal to		+		PGAsl
/	O	Operator for division		+		PGAsl
/0		block is skipped (1st skip level)		+		PGsl
...		...				
...		...				
/7		block is skipped (8th skip level)				
A	A	Axis name	m/s	+		PGAsl
A2	A	Tool orientation: RPY or Euler angle	s	+		PGAsl
A3	A	Tool orientation: 1st component of the direction vector	s	+		PGAsl
A4	A	Tool orientation: 1st component of the surface normal vector at start of block	s	+		PGAsl
A5	A	Tool orientation: 1st component of the surface normal vector at end of block	s	+		PGAsl
A6	A	Tool orientation: 1st component of the direction vector for taper's axis of rotation	s	+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
A7	A	Tool orientation: 1st Vector component for intermediate orientation on peripheral surface of taper	s	+		PGAsI
ABS	F	Absolute value (amount)		+	+	PGAsI
AC	K	Absolute dimensions of coordinates/positions	s	+		PGsI
ACC	K	Effect of current axial acceleration	m	+	+	PGsI
ACCLIMA	K	Effect of current maximum axial acceleration	m	+	+	PGAsI
ACN	K	Absolute dimensions for rotary axes, approach position in negative direction	s	+		PGsI
ACOS	F	Arc cosine (trigon. function)		+	+	PGAsI
ACP	K	Absolute dimensions for rotary axes, approach position in positive direction	s	+		PGsI
ACTBLOCNO	P	Output of current block number of an alarm block, even if "current block display suppressed" (DISPLOF) is active!		+		PGAsI
ADDFRAME	F	Inclusion and possible activation of a measured frame		+	-	PGAsI, FB1sI (K2)
ADIS	A	Rounding clearance for path functions G1, G2, G3, ...	m	+		PGsI
ADISPOS	A	Rounding clearance for rapid traverse G0	m	+		PGsI
ADISPOSA	P	Size of the tolerance window for IPOBRKA	m	+	+	PGAsI
ALF	A	LIFTFAST angle	m	+		PGAsI
AMIRROR	G	Programmable mirroring	s	+		PGsI
AND	K	Logical AND		+		PGAsI
ANG	A	Contour angle	s	+		PGsI
AP	A	Polar angle	m/s	+		PGsI
APR	K	Read/show access protection		+		PGAsI
APRB	K	Read access right, OPI		+		PGAsI
APRP	K	Read access right, part program		+		PGAsI
APW	K	Write access protection		+		PGAsI
APWB	K	Write access right, OPI		+		PGAsI
APWP	K	Write access right, part program		+		PGAsI
APX	K	Definition of the access right for executing the specified language element		+		PGAsI
AR	A	Opening angle	m/s	+		PGsI
AROT	G	Programmable rotation	s	+		PGsI
AROTS	G	Programmable frame rotations with solid angles	s	+		PGsI
AS	K	Macro definition		+		PGAsI
ASCALE	G	Programmable scaling	s	+		PGsI
ASIN	F	Arithmetic function, arc sine		+	+	PGAsI
ASPLINE	G	Akima spline	m	+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
ATAN2	F	Arc tangent 2		+	+	PGAsI
ATOL	A	Axis-specific tolerance for compressor functions, orientation smoothing and smoothing types	m	+		PGAsI
ATRANS	G	Additive programmable work offset	s	+		PGsI
AUXFUDEL	P	Delete auxiliary function channel-specifically from the global list		+	-	FB1sI (H2)
AUXFUDELG	P	Delete all auxiliary functions of an auxiliary function group channel-specifically from the global list		+	-	FB1sI (H2)
AUXFUMSEQ	P	Determine output sequence of M auxiliary functions		+	-	FB1sI (H2)
AUXFUSYNC	P	Generate a complete part program block for the channel-specific SERUPRO end ASUB as string from the global list of auxiliary functions		+	-	FB1sI (H2)
AX	K	Variable axis identifier	m/s	+		PGAsI
AXCTSWE	P	Rotate axis container		+	-	PGAsI
AXCTSWEC	P	Canceling enable for axis container rotation		+	+	PGAsI
AXCTSWED	P	Rotating axis container (command variant for commissioning!)		+	-	PGAsI
AXIS	K	Axis identifier, axis address		+		PGAsI
AXNAME	F	Converts input string into axis identifier		+	-	PGAsI
AXSTRING	F	Converts string spindle number		+	-	PGAsI
AXTOCHAN	P	Request axis for a specific channel. Possible from NC program and synchronized action.		+	+	PGAsI
AXTOSPI	F	Converts axis identifier into a spindle index		+	-	PGAsI
B	A	Axis name	m/s	+		PGAsI
B2	A	Tool orientation: RPY or Euler angle	s	+		PGAsI
B3	A	Tool orientation: 2nd component of the direction vector	s	+		PGAsI
B4	A	Tool orientation: 2nd component of the surface normal vector at start of block	s	+		PGAsI
B5	A	Tool orientation: 2nd component of the surface normal vector at end of block	s	+		PGAsI
B6	A	Tool orientation: 2nd component of the direction vector for taper's axis of rotation	s	+		PGAsI
B7	A	Tool orientation: 2nd Vector component for intermediate orientation on peripheral surface of taper	s	+		PGAsI
B_AND	O	Bit-by-bit AND		+		PGAsI
B_OR	O	Bit-by-bit OR		+		PGAsI
B_NOT	O	Bit-by-bit negation		+		PGAsI
B_XOR	O	Bit-by-bit exclusive OR		+		PGAsI
BAUTO	G	Definition of the first spline section by means of the next 3 points	m	+		PGAsI

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
BLOCK	K	Together with the keyword TO defines the program part to be processed in an indirect subprogram call		+		PGAsI
BLSYNC	K	Processing of interrupt routine is only to start with the next block change		+		PGAsI
BNAT ⁶⁾	G	Natural transition to first spline block	m	+		PGAsI
BOOL	K	Data type: Boolean value TRUE/FALSE or 1/0		+		PGAsI
BOUND	F	Tests whether the value falls within the defined value range. If the values are equal, the test value is returned.		+	+	PGAsI
BRISK ⁶⁾	G	Fast non-smoothed path acceleration	m	+		PGAsI
BRISKA	P	Switch on brisk path acceleration for the programmed axes		+	-	PGAsI
BSPLINE	G	B spline	m	+		PGAsI
BTAN	G	Tangential transition to first spline block	m	+		PGAsI
C	A	Axis name	m/s	+		PGAsI
C2	A	Tool orientation: RPY or Euler angle	s	+		PGAsI
C3	A	Tool orientation: 3rd component of the direction vector	s	+		PGAsI
C4	A	Tool orientation: 3rd component of the surface normal vector at start of block	s	+		PGAsI
C5	A	Tool orientation: 3rd component of the surface normal vector at end of block	s	+		PGAsI
C6	A	Tool orientation: 3rd component of the direction vector for taper's axis of rotation	s	+		PGAsI
C7	A	Tool orientation: 3rd Vector component for intermediate orientation on peripheral surface of taper	s	+		PGAsI
CAC	K	Absolute position approach		+		PGAsI
CACN	K	Absolute approach of the value listed in the table in negative direction		+		PGAsI
CACP	K	Absolute approach of the value listed in the table in positive direction		+		PGAsI
CALCDAT	F	Calculates radius and center point of circle from 3 or 4 points		+	-	PGAsI
CALCPOSI	F	Checking for protection area violation, working area limitation and software limits		+	-	PGAsI
CALL	K	Indirect subprogram call		+		PGAsI
CALLPATH	P	Programmable search path for subprogram calls		+	-	PGAsI
CANCEL	P	Cancel modal synchronized action		+	-	FBSYsI
CASE	K	Conditional program branch		+		PGAsI
CDC	K	Direct approach of a position		+		PGAsI
CDOF ⁶⁾	G	Switch off collision monitoring	m	+		PGsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CDOF2	G	Switch off collision monitoring during 3D circumferential milling	m	+		PGsl
CDON	G	Activate collision monitoring	m	+		PGsl
CFC ⁶⁾	G	Constant feedrate on contour	m	+		PGsl
CFIN	G	Constant feedrate for internal radius only, not for external radius	m	+		PGsl
CFINE	F	Assignment of fine offset to a FRAME variable		+	-	PGAsl
CFTCP	G	Constant feedrate in tool center point (center point path)	m	+		PGsl
CHAN	K	Specify validity range for data		+		PGAsl
CHANDATA	P	Set channel number for channel data access		+	-	PGAsl
CHAR	K	Data type: ASCII character		+		PGAsl
CHF	A	Chamfer; value = length of chamfer	s	+		PGsl
CHKDM	F	Uniqueness check within a magazine		+	-	FBWsl
CHKDNO	F	Check for unique D numbers		+	-	PGAsl
CHR	A	Chamfer; value = length of chamfer in direction of movement		+		PGsl
CIC	K	Approach position by increments		+		PGAsl
CIP	G	Circular interpolation through intermediate point	m	+		PGsl
CLEARM	P	Reset one/several markers for channel coordination		+	+	PGAsl
CLRINT	P	Deselect interrupt		+	-	PGAsl
CMIRROR	F	Mirror on a coordinate axis		+	-	PGAsl
COARSEA	K	Motion end when "Exact stop coarse" reached	m	+		PGAsl
COLLPAIR	F	Check whether part of a collision pair		+		PGAsl
COMPCAD	G	Activate the compressor function COMPCAD	m	+		PGAsl
COMPCURV	G	Activate the compressor function COMP-CURV	m	+		PGAsl
COMPLETE		Control instruction for reading and writing data		+		PGAsl
COMPOF ⁶⁾	G	Deactivate NC block compression	m	+		PGAsl
COMPON	G	Activate the compressor function COMPON	m	+		PGAsl
COMPSURF	G	Activate the compressor function COMPSURF	m	+		PGAsl
CONTDCON	P	Activate tabular contour decoding		+	-	PGAsl
CONTPRON	P	Activate reference preprocessing		+	-	PGAsl
CORROF	P	All active overlaid movements are deselected.		+	-	PGsl
CORRTrafo	F	Modifying offset vectors or direction vectors for the orientation axes in the kinematic model of the machine		+	-	PGAsl
COS	F	Cosine (trigon. function)		+	+	PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
COUPDEF	P	Definition ELG group/synchronous spindle group		+	-	PGAsI
COUPDEL	P	Delete ELG group		+	-	PGAsI
COUPOF	P	Deactivate ELG group / synchronous spindle pair		+	-	PGAsI
COUPOFS	P	Deactivate ELG group/synchronous spindle pair with stop of following spindle		+	-	PGAsI
COUPON	P	Activate ELG group / synchronous spindle pair		+	-	PGAsI
COUPONC	P	Transfer activation of ELG group/synchronous spindle pair with previous programming		+	-	PGAsI
COUPRES	P	Reset ELG group		+	-	PGAsI
CP ⁶⁾	G	Path motion	m	+		PGAsI
CPBC	K	Generic coupling: Block change criterion		+	+	FB3sl (M3)
CPDEF	K	Generic coupling: Creating a coupling module		+	+	FB3sl (M3)
CPDEL	K	Generic coupling: Deletion of a coupling module		+	+	FB3sl (M3)
CPFMOF	K	Generic coupling: Behavior of the following axis at complete switch-off		+	+	FB3sl (M3)
CPFMON	K	Generic coupling: Behavior of the following axis when switching on		+	+	FB3sl (M3)
CPFMSON	K	Generic coupling: Synchronization mode		+	+	FB3sl (M3)
CPFPOS	K	Generic coupling: Synchronized position of the following axis		+	+	FB3sl (M3)
CPFRS	K	Generic coupling: Coordinate reference system		+	+	FB3sl (M3)
CPLA	K	Generic coupling: Definition of a leading axis		+	-	FB3sl (M3)
CPLCTID	K	Generic coupling: Number of the curve table		+	+	FB3sl (M3)
CPLDEF	K	Generic coupling: Definition of a leading axis and creation of a coupling module		+	+	FB3sl (M3)
CPLDEL	K	Generic coupling: Deleting a leading axis of a coupling module		+	+	FB3sl (M3)
CPLDEN	K	Generic coupling: Denominator of the coupling factor		+	+	FB3sl (M3)
CPLINSC	K	Generic coupling: Scaling factor of the input value of a leading axis		+	+	FB3sl (M3)
CPLINTR	K	Generic coupling: Offset value of the input value of a leading axis		+	+	FB3sl (M3)
CPLNUM	K	Generic coupling: Numerator of the coupling factor		+	+	FB3sl (M3)
CPLOF	K	Generic coupling: Switching off a leading axis of a coupling module		+	+	FB3sl (M3)
CPLON	K	Generic coupling: Switching on a leading axis of a coupling module		+	+	FB3sl (M3)
CPLOUTSC	K	Generic coupling: Scaling factor for the output value of a coupling		+	+	FB3sl (M3)

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CPLOUTTR	K	Generic coupling: Offset value for the output value of a coupling		+	+	FB3sl (M3)
CPLPOS	K	Generic coupling: Synchronized position of the leading axis		+	+	FB3sl (M3)
CPLSETVAL	K	Generic coupling: Coupling reference		+	+	FB3sl (M3)
CPMALARM	K	Generic coupling: Suppression of special coupling-related alarm outputs		+	+	FB3sl (M3)
CPMBRAKE	K	Generic coupling: Response of the following axis to certain stop signals and stop commands		+	-	FB3sl (M3)
CPMPRT	K	Generic coupling: Coupling response at part program start under block search run via program test		+	+	FB3sl (M3)
CPMRESET	K	Generic coupling: Coupling behavior for RESET		+	+	FB3sl (M3)
CPMSTART	K	Generic coupling: Coupling behavior at part program start		+	+	FB3sl (M3)
CPMVDI	K	Generic coupling: Response of the following axis to certain NC/PLC interface signals		+	+	FB3sl (M3)
CPOF	K	Generic coupling: Switching off a coupling module		+	+	FB3sl (M3)
CPON	K	Generic coupling: Switching on a coupling module		+	+	FB3sl (M3)
CPRECOF ⁶⁾	G	Deactivate programmable contour accuracy	m	+		PGAsl
CPRECON	G	Activate programmable contour accuracy	m	+		PGAsl
CPRES	K	Generic coupling: Activates the configured data of the synchronous spindle coupling		+	-	FB3sl (M3)
CPROT	P	Activate / deactivate channel-specific protection zone		+	-	PGAsl
CPROTDEF	P	Definition of a channel-specific protection area		+	-	PGAsl
CPSETTYPE	K	Generic coupling: Coupling type		+	+	FB3sl (M3)
CPSYNCOF	K	Generic coupling: Threshold value of position synchronism "Coarse"		+	+	FB3sl (M3)
CPSYNCOF2	K	Generic coupling: Threshold value of position synchronism "Coarse" 2		+	+	FB3sl (M3)
CPSYNCOV	K	Generic coupling: Threshold value of velocity synchronism "Coarse"		+	+	FB3sl (M3)
CPSYNFIP	K	Generic coupling: Threshold value of position synchronism "Fine"		+	+	FB3sl (M3)
CPSYNFIP2	K	Generic coupling: Threshold value of position synchronism "Fine" 2		+	+	FB3sl (M3)
CPSYNFIV	K	Generic coupling: Threshold value of velocity synchronism "Fine"		+	+	FB3sl (M3)
CR	A	Circle radius	s	+		PGsl
CROT	F	Rotation of the current coordinate system		+	-	PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CROTS	F	Programmable frame rotations with solid angles (rotation in the specified axes)	s	+	-	PGsl
CRPL	F	Frame rotation in any plane		+	-	FB1sl (K2)
CSCALE	F	Scale factor for multiple axes		+	-	PGAsl
CSPLINE	F	Cubic spline	m	+		PGAsl
CT	G	Circle with tangential transition	m	+		PGsl
CTAB	F	Define following axis position according to leading axis position from curve table		+	+	PGAsl
CTABDEF	P	Activate table definition		+	-	PGAsl
CTABDEL	P	Clear curve table		+	-	PGAsl
CTABEND	P	Deactivate table definition		+	-	PGAsl
CTABEXISTS	F	Checks the curve table with number n		+	+	PGAsl
CTABFNO	F	Number of curve tables still possible in the memory		+	+	PGAsl
CTABFPOL	F	Number of polynomials still possible in the memory		+	+	PGAsl
CTABFSEG	F	Number of curve segments still possible in the memory		+	+	PGAsl
CTABID	F	Returns table number of the nth curve table		+	+	PGAsl
CTABINV	F	Define leading axis position according to following axis position from curve table		+	+	PGAsl
CTABISLOCK	F	Returns the lock state of the curve table with number n		+	+	PGAsl
CTABLOCK	P	Delete and overwrite, lock		+	+	PGAsl
CTABMEMTYP	F	Returns the memory in which curve table number n is created.		+	+	PGAsl
CTABMPOL	F	Max. number of polynomials still possible in the memory		+	+	PGAsl
CTABMSEG	F	Max. number of curve segments still possible in the memory		+	+	PGAsl
CTABNO	F	Number of defined curve tables in SRAM or DRAM		+	+	FB3sl (M3)
CTABNOMEM	F	Number of defined curve tables in SRAM or DRAM		+	+	PGAsl
CTABPERIOD	F	Returns the table periodicity of curve table number n		+	+	PGAsl
CTABPOL	F	Number of polynomials already used in the memory		+	+	PGAsl
CTABPOLID	F	Number of the curve polynomials used by the curve table with number n		+	+	PGAsl
CTABSEG	F	Number of curve segments already used in the memory		+	+	PGAsl
CTABSEGID	F	Number of the curve segments used by the curve table with number n		+	+	PGAsl

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CTABSEV	F	Returns the final value of the following axis of a segment of the curve table		+	+	PGAsl
CTABSSV	F	Returns the initial value of the following axis of a segment of the curve table		+	+	PGAsl
CTABTEP	F	Returns the value of the leading axis at curve table end		+	+	PGAsl
CTABTEV	F	Returns the value of the the following axis at curve table end		+	+	PGAsl
CTABTMAX	F	Returns the maximum value of the following axis of the curve table		+	+	PGAsl
CTABTMIN	F	Returns the minimum value of the following axis of the curve table		+	+	PGAsl
CTABTSP	F	Returns the value of the leading axis at curve table start		+	+	PGAsl
CTABTSV	F	Returns the value of the following axis at curve table start		+	+	PGAsl
CTABUNLOCK	P	Revoke delete and overwrite lock		+	+	PGAsl
CTOL	A	Contour tolerance for compressor functions, orientation smoothing and smoothing types	m	+		PGAsl
CTRANS	F	Zero offset for multiple axes		+	-	PGAsl
CUT2D ⁶⁾	G	2D TRC	m	+		PGsl
CUT2DD	G	2½ D TRC in relation to the differential tool	m	+		PGsl
CUT2DF	G	2 D TRC relative to the current frame (inclined plane)	m	+		PGsl
CUT2DFD	G	2½ D TRC in relation to the differential tool relative to the current frame (inclined plane)	m	+		PGsl
CUT3DC	G	3D TRC for circumferential milling	m	+		PGAsl
CUT3DCC	G	3D TRC for circumferential milling taking into account a limitation surface with 3D radius compensation Contour on the machining surface	m	+		PGAsl
CUT3DCCD	G	3D TRC for circumferential milling taking into account a limitation surface with differential tool on the tool center point path Infeed to the limitation surface.	m	+		PGAsl
CUT3DCD	G	3D TRC in relation to a differential tool for circumferential milling	m	+		PGAsl
CUT3DF	G	3D TRC for face milling with change in orientation	m	+		PGAsl
CUT3DFD	G	3D TRC in relation to a differential tool for face milling with change in orientation	m	+		PGAsl
CUT3DFF	G	3D TRC for face milling with constant orientation. The tool orientation is the direction defined by G17 - G19 and, in some cases, rotated by a frame.	m	+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CUT3DFS	G	3D TRC for face milling with constant orientation. The tool orientation is defined by G17 - G19 and is not influenced by frames.	m	+		PGAsl
CUTCONOF ⁶⁾	G	Deactivate tool radius compensation	m	+		PGsl
CUTCONON	G	Activate tool radius compensation	m	+		PGsl
CUTMOD	A	Activate Modification of the offset data for rotatable tools (in connection with orientable tool carriers)	m	+		PGAsl
CUTMODK	A	Activate Modification of the offset data for rotatable tools (in connection with orientation transformations defined by kinematic chains)	m	+		PGAsl
CYCLE60	C (T)	Engraving cycle		+		PGAsl
CYCLE61	C (T)	Face milling		+		PGAsl
CYCLE62	C (T)	Contour call		+		PGAsl
CYCLE63	C (T)	Contour pocket milling		+		PGAsl
CYCLE64	C (T)	Contour pocket predrilling		+		PGAsl
CYCLE70	C (T)	Thread milling		+		PGAsl
CYCLE72	C (T)	Path milling		+		PGAsl
CYCLE76	C (T)	Milling the rectangular spigot		+		PGAsl
CYCLE77	C (T)	Circular spigot milling		+		PGAsl
CYCLE78	C (T)	Mill cutting thread		+		PGAsl
CYCLE79	C (T)	Multiple edge		+		PGAsl
CYCLE81	C (T)	Drilling, centering		+		PGAsl
CYCLE82	C (T)	Drilling, counterboring		+		PGAsl
CYCLE83	C (T)	Deep-hole drilling		+		PGAsl
CYCLE84	C (T)	Tapping without compensating chuck		+		PGAsl
CYCLE85	C (T)	Reaming		+		PGAsl
CYCLE86	C (T)	Boring		+		PGAsl
CYCLE92	C (T)	Parting		+		PGAsl
CYCLE95	C (T)	Stock removal along the contour		+		PGAsl
CYCLE98	C (T)	Thread chain		+		PGAsl
CYCLE99	C (T)	Thread cutting		+		PGAsl
CYCLE150	C (M)	Displaying/logging measurement results		+		BNMsl
CYCLE435	C (T)	Calculate dressing tool position		+		PGAsl
CYCLE495	C (T)	Form-truing		+		PGAsl
CYCLE750	C (A)	Internal operating cycle for CYCLE751... CYCLE759 (contains the MMC command for the actual function call)		-		FB3sl (T4)
CYCLE751	C (A)	Open / perform / close an optimization session		M		FB3sl (T4)
CYCLE752	C (A)	Add axis to an optimization session		M		FB3sl(T4)
CYCLE753	C (A)	Select optimization mode		M		FB3sl (T4)
CYCLE754	C (A)	Add / remove language block		M		FB3sl (T4)
CYCLE755	C (A)	Backing up/restoring data block		M		FB3sl (T4)

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CYCLE756	C (A)	Activate optimization results		M		FB3sl (T4)
CYCLE757	C (A)	Store optimization data		M		FB3sl (T4)
CYCLE758	C (A)	Changing the parameter value		M		FB3sl (T4)
CYCLE759	C (A)	Read parameter value		M		FB3sl (T4)
CYCLE800	C (T)	Swiveling		+		PGAsl
CYCLE801	C (T)	Grid or frame		+		PGAsl
CYCLE802	C (T)	Arbitrary positions		+		PGAsl
CYCLE830	C (T)	Deep-hole drilling 2		+		PGAsl
CYCLE832	C (T)	High-Speed Settings		+		PGAsl
CYCLE840	C (T)	Tapping with compensating chuck		+		PGAsl
CYCLE899	C (T)	Open slot milling		+		PGAsl
CYCLE930	C (T)	Groove		+		PGAsl
CYCLE940	C (T)	Undercut forms		+		PGAsl
CYCLE951	C (T)	Stock removal		+		PGAsl
CYCLE952	C (T)	Contour grooving		+		PGAsl
CYCLE961	C (M)	Determine the position of a workpiece corner (inner or outer) and insert as work offset.		+		BNMsl
CYCLE971	C (M)	Calibrate tool probe, measure tool length and/or tool radius (only for milling)		+		BNMsl
CYCLE973	C (M)	Calibrate a workpiece probe on a surface on the workpiece or in a groove (only for turning)		+		BNMsl
CYCLE974	C (M)	Determine the workpiece zero in the selected measuring axis, determine tool offset with 1-point measurement (only for turning).		+		BNMsl
CYCLE976	C (M)	Calibrate a workpiece probe in a calibration ring or on a calibration ball completely in the working plane or at an edge for a particular axis and direction		+		BNMsl
CYCLE977	C (M)	Determine the center in the plane as well as the width or the diameter		+		BNMsl
CYCLE978	C (M)	Measure the position of an edge in the workpiece coordinate system		+		BNMsl
CYCLE979	C (M)	Determine center in the plane, measure radius of circle segment.		+		BNMsl
CYCLE982	C (M)	Calibrate tool probe, measure turning drilling and milling tools (only for turning)		+		BNMsl
CYCLE994	C (M)	Determine the workpiece zero in the selected measuring axis with 2-point measurement (only for turning).		+		BNMsl
CYCLE995	C (M)	Measure the angularity of the spindle on a machine tool		+		BNMsl
CYCLE996	C (M)	Determine transformation-relevant data for kinematic transformations with rotary axes		+		BNMsl
CYCLE997	C (M)	Determine center and diameter of a ball, measure center of three distributed balls		+		BNMsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
CYCLE998	C (M)	Determine the angular position of a surface (plane) referred to the working plane, determine angle of edges in the workpiece coordinate system.		+		BNMsl
CYCLE4071	C (T)	Longitudinal grinding with infeed at the reversal point		+		PGAsl
CYCLE4072	C (T)	Longitudinal grinding with infeed at the reversal point and cancel signal		+		PGAsl
CYCLE4073	C (T)	Longitudinal grinding with continuous infeed		+		PGAsl
CYCLE4074	C (T)	Longitudinal grinding with continuous infeed and cancel signal		+		PGAsl
CYCLE4075	C (T)	Surface grinding with infeed at the reversal point		+		PGAsl
CYCLE4077	C (T)	Surface grinding with infeed at the reversal point and cancel signal		+		PGAsl
CYCLE4078	C (T)	Surface grinding with continuous infeed		+		PGAsl
CYCLE4079	C (T)	Surface grinding with intermittent infeed		+		PGAsl

Operations D ... F

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
D	O	Tool offset number		+		PGsl
D0	O	With D0, offsets for the tool are ineffective		+		PGsl
DAC	K	Absolute non-modal axis-specific diameter programming	s	+		PGsl
DC	K	Absolute dimensions for rotary axes, approach position directly	s	+		PGsl
DCI	K	Assign data class I (= Individual) (only SINUMERIK 828D)		+		PGAsl
DCM	K	Assign data class M (= Manufacturer) (only SINUMERIK 828D)		+		PGAsl
DCU	K	Assign data class U (= User) (only SINUMERIK 828D)		+		PGAsl
DEF	K	Variable definition		+		PGAsl
DEFAULT	K	Branch in CASE branch		+		PGAsl
DEFINE	K	Keyword for macro definitions		+		PGAsl
DELAYFSTOF	P	Define the end of a stop delay section	m	+	-	PGAsl
DELAYFSTON	P	Define the start of a stop delay section	m	+	-	PGAsl
DELDL	F	Delete additive offsets		+	-	PGAsl
DELDTG	P	Delete distance-to-go		-	+	FBSYsl
DELETE	P	Delete the specified file. The file name can be specified with path and file identifier.		+	-	PGAsl

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
¹⁾²⁾³⁾⁴⁾⁵⁾ for explanations, see legend (Page 858).						
DELMOWNER	F	Delete owner magazine location of the tool		+	-	FBWsl
DEMLRES	F	Delete magazine location reservation		+	-	FBWsl
DELMT	P	Delete multitool		+	-	FBWsl
DELOBJ	F	Deletion of elements from kinematic chains, protection areas, protection area elements, collision pairs and transformation data		+		PGAsl
DELT	P	Delete Tool		+	-	FBWsl
DELTC	P	Delete toolholder data record		+	-	FBWsl
DELTOOLENV	F	Delete data records describing tool environments		+	-	PGAsl
DIACYCOFA	K	Axis-specific modal diameter programming: OFF in cycles	m	+		FB1sl (P1)
DIAM90	G	Diameter programming for G90, radius programming for G91	m	+		PGAsl
DIAM90A	K	Axis-specific modal diameter programming for G90 and AC, radius programming for G91 and IC	m	+		PGsl
DIAMCHAN	K	Transfer of all axes from MD axis functions to diameter programming channel status		+		PGsl
DIAMCHANA	K	Transfer of the diameter programming channel status		+		PGsl
DIAMCYCOF	G	Channel-specific diameter programming: OFF in cycles	m	+		FB1sl (P1)
DIAMOF ⁶⁾	G	Diameter programming: OFF Normal position, see machine manufacturer	m	+		PGsl
DIAMOFA	K	Axis-specific modal diameter programming: OFF Normal position, see machine manufacturer	m	+		PGsl
DIAMON	G	Diameter programming: ON	m	+		PGsl
DIAMONA	K	Axis-specific modal diameter programming: ON Activation, see machine manufacturer	m	+		PGsl
DIC	K	Relative non-modal axis-specific diameter programming	s	+		PGsl
DILF	O	Retraction path (length)	m	+		PGsl
DISABLE	P	Interrupt OFF		+	-	PGAsl
DISC	O	Transition circle overshoot tool radius compensation	m	+		PGsl
DISCL	O	Clearance between the end point of the fast infeed motion and the machining plane		+		PGsl
DISPLOF	PA	Suppress current block display		+		PGAsl
DISPLON	PA	Revoke suppression of the current block display		+		PGAsl
DISPR	O	Path differential for repositioning	s	+		PGAsl
DISR	O	Distance for repositioning	s	+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1)2)3)4)5) for explanations, see legend (Page 858).						
DISRP	O	Distance between the retraction plane and the machining plane during smooth approach and retraction		+		PGsl
DITE	O	Thread run-out path	m	+		PGsl
DITS	O	Thread run-in path	m	+		PGsl
DIV	K	Integer division		+		PGAsl
DL	O	Select location-dependent additive tool offset (DL, total set-up offset)	m	+		PGAsl
DO	O	Keyword for synchronized action, triggers action when condition is fulfilled		-	+	FBSYsl
DRFOF	P	Deactivation of handwheel offsets (DRF)	m	+	-	PGsl
DRIVE	G	Velocity-dependent path acceleration	m	+		PGAsl
DRIVEA	P	Activate knee-shaped acceleration characteristic for the programmed axes		+	-	PGAsl
DYNFINISH	G	Dynamic response for smooth finishing	m	+		PGAsl
DYNNORM ⁶⁾	G	Standard dynamic response	m	+		PGAsl
DYNPOS	G	Dynamic response for positioning mode, tapping	m	+		PGAsl
DYNROUGH	G	Dynamic response for roughing	m	+		PGAsl
DYNSEMIFIN	G	Dynamic response for finishing	m	+		PGAsl
DZERO	P	Marks all D numbers of the TO unit as invalid		+	-	PGAsl
EAUTO	G	Definition of the last spline section by means of the last 3 points	m	+		PGAsl
EGDEF	P	Definition of an electronic gear		+	-	PGAsl
EGDEL	P	Delete coupling definition for the following axis		+	-	PGAsl
EGOFC	P	Turn off electronic gear continuously		+	-	PGAsl
EGOFS	P	Turn off electronic gear selectively		+	-	PGAsl
EGON	P	Turn on electronic gear		+	-	PGAsl
EGONSYN	P	Turn on electronic gear		+	-	PGAsl
EGONSYNE	P	Turn on electronic gear, with specification of approach mode		+	-	PGAsl
ELSE	K	Program branch, if IF condition not fulfilled		+		PGAsl
ENABLE	P	Interrupt ON		+	-	PGAsl
ENAT ⁶⁾	G	Natural transition to next traversing block	m	+		PGAsl
ENDFOR	K	End line of FOR counter loop		+		PGAsl
ENDIF	K	End line of IF branch		+		PGAsl
ENDLABEL	K	End label for part program repetitions with REPEAT		+		PGAsl, FB1sl (K1)
ENDLOOP	K	End line of endless program loop LOOP		+		PGAsl
ENDPROC	K	End line of program with start line PROC		+		
ENDWHILE	K	End line of WHILE loop		+		PGAsl
ESRR	P	Parameterizing drive-autonomous ESR retraction in the drive		+		PGAsl

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
¹⁾²⁾³⁾⁴⁾⁵⁾ for explanations, see legend (Page 858).						
ESRS	P	Parameterizing drive-autonomous ESR shut-down in the drive		+		PGAsI
ETAN	G	Tangential transition to next traversing block at spline begin	m	+		PGAsI
EVERY	K	Execute synchronized action on transition of condition from FALSE to TRUE		-	+	FBSySI
EX	K	Keyword for value assignment in exponential notation		+		PGAsI
EXECSTRING	P	Transfer of a string variable with the executing part program line		+	-	PGAsI
EXECTAB	P	Execute an element from a motion table		+	-	PGAsI
EXECUTE	P	Program execution ON		+	-	PGAsI
EXP	F	Exponential function ex		+	+	PGAsI
EXTCALL	O	Execute external subprogram		+	+	PGAsI
EXTCLOSE	P	Closing external device / file that was opened for writing		+	-	PGAsI
EXTERN	K	Declaration of a subprogram with parameter transfer		+		PGAsI
EXTOPEN	P	Opening external device / file for the channel for writing		+	-	PGAsI
F	O	Feedrate value (in conjunction with G4 the dwell time is also programmed with F)		+	+	PGsI
FA	K	Axial feedrate	m	+	+	PGsI
FAD	O	Infeed rate for soft approach and retraction		+		PGsI
FALSE	K	Logical constant: Incorrect		+	+	PGAsI
FB	O	Non-modal feedrate		+		PGsI
FCTDEF	P	Define polynomial function		+	-	PGAsI
FCUB	G	Feedrate variable according to cubic spline	m	+		PGAsI
FD	O	Path feedrate for handwheel override	s	+		PGsI
FDA	K	Axis feedrate for handwheel override	s	+		PGsI
FENDNORM ⁶⁾	G	Corner deceleration OFF	m	+		PGAsI
FFWOF ⁶⁾	G	Feedforward control OFF	m	+		PGAsI
FFWON	G	Feedforward control ON	m	+		PGAsI
FGREF	K	Reference radius for rotary axes or path reference factors for orientation axes (vector interpolation)	m	+		PGsI
FGROUP	P	Definition of axis/axes with path feedrate		+	-	PGsI
FI	K	Parameter for access to frame data: Fine offset		+		PGAsI
FIFOCTRL	G	Control of preprocessing buffer	m	+		PGAsI
FILEDATE	P	Returns date of most recent write access to file		+	-	PGAsI

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1)2)3)4)5) for explanations, see legend (Page 858).						
FILEINFO	P	Returns summary information listing FILE-DATE, FILESIZE, FILESTAT, and FILETIME		+	-	PGAsI
FILESIZE	P	Returns current file size		+	-	PGAsI
FILESTAT	P	Returns file status of rights for read, write, execute, display, delete (rwxsd)		+	-	PGAsI
FILETIME	P	Returns time of most recent write access to file		+	-	PGAsI
FINEA	K	End of motion when "Exact stop fine" reached	m	+		PGAsI
FL	K	Limit velocity for synchronized axis	m	+		PGsI
FLIN	G	Feed linear variable	m	+		PGAsI
FMA	K	Multiple feedrates axial	m	+		PGsI
FNORM ⁶⁾	G	Feedrate normal to DIN 66025	m	+		PGAsI
FOC	K	Non-modal torque/force limitation	s	-	+	FBSYsI
FOCOF	K	Switch off modal torque/force limitation	m	-	+	FBSYsI
FOCON	K	Switch on modal torque/force limitation	m	-	+	FBSYsI
FOR	K	Counter loop with fixed number of passes		+		PGAsI
FP	O	Fixed point: Number of fixed point to be approached	s	+		PGsI
FPO	K	Feedrate characteristic programmed via a polynomial		+		PGAsI
FPR	P	Rotary axis identifier		+	-	PGsI
FPRAOF	P	Deactivate revolutionary feedrate		+	-	PGsI
FPRAON	P	Activate revolutionary feedrate		+	-	PGsI
FRAME	K	Data type for the definition of coordinate systems		+		PGAsI
FRC	O	Feedrate for radius and chamfer	s	+		PGsI
FRCM	O	Feedrate for radius and chamfer, modal	m	+		PGsI
FROM	K	The action is executed if the condition is fulfilled once and as long as the synchronized action is active		-	+	FBSYsI
FTOC	P	Change fine tool offset		-	+	FBSYsI
FTOCOF ⁶⁾	G	Online fine tool offset OFF	m	+		PGAsI
FTOCON	G	Online fine tool offset ON	m	+		PGAsI
FXS	K	Travel to fixed stop ON	m	+	+	PGsI
FXST	K	Torque limit for travel to fixed stop	m	+	+	PGsI
FXSW	K	Monitoring window for travel to fixed stop		+	+	PGsI
FZ	K	Tooth feedrate	m	+		PGsI

Operations G ... L

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
G0	G	Linear interpolation with rapid traverse (rapid traverse motion)	m	+		PGsl
G1 ⁶⁾	G	Linear interpolation with feedrate (linear interpolation)	m	+		PGsl
G2	G	Circular interpolation clockwise	m	+		PGsl
G3	G	Circular interpolation counter-clockwise	m	+		PGsl
G4	G	Dwell time, preset	s	+		PGsl
G5	G	Oblique plunge-cut grinding	s	+		PGAsl
G7	G	Compensatory motion during oblique plunge-cut grinding	s	+		PGAsl
G9	G	Exact stop - deceleration	s	+		PGsl
G17 ⁶⁾	G	Selection of working plane X/Y	m	+		PGsl
G18	G	Selection of working plane Z/X	m	+		PGsl
G19	G	Selection of working plane Y/Z	m	+		PGsl
G25	G	Lower working area limitation	s	+		PGsl
G26	G	Upper working area limitation	s	+		PGsl
G33	G	Thread cutting with constant lead	m	+		PGsl
G34	G	Thread cutting with linear increasing lead	m	+		PGsl
G35	G	Thread cutting with linear decreasing lead	m	+		PGsl
G40 ⁶⁾	G	Tool radius compensation OFF	m	+		PGsl
G41	G	Tool radius compensation left of contour	m	+		PGsl
G42	G	Tool radius compensation right of contour	m	+		PGsl
G53	G	Suppression of current zero offset (non-modal)	s	+		PGsl
G54	G	1st settable zero offset	m	+		PGsl
G55	G	2nd settable zero offset	m	+		PGsl
G56	G	3rd settable zero offset	m	+		PGsl
G57	G	4th settable zero offset	m	+		PGsl
G58 (840D sl)	G	Absolute programmable work offset (coarse offset)	s	+		PGsl
G58 (828D)	G	5th settable zero offset	m	+		PGsl
G59 (840D sl)	G	Additive programmable work offset (fine offset)	s	+		PGsl
G59 (828D)	G	6th settable zero offset	m	+		PGsl
G60 ⁶⁾	G	Exact stop - deceleration	m	+		PGsl
G62	G	Corner deceleration at inside corners when tool radius offset is active (G41, G42)	m	+		PGAsl
G63	G	Tapping with compensating chuck	s	+		PGsl
G64	G	Continuous-path mode	m	+		PGsl
G70	G	Inch dimensions for geometric specifications (lengths)	m	+	+	PGsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
G71 ⁶⁾	G	Metric dimensions for geometric specifications (lengths)	m	+	+	PGsl
G74	G	Search for reference	s	+		PGsl
G75	G	Fixed point approach	s	+		PGsl
G90 ⁶⁾	G	Absolute dimensions	m/s	+		PGsl
G91	G	Incremental dimensions	m/s	+		PGsl
G93	G	Inverse-time feedrate rpm	m	+		PGsl
G94 ⁶⁾	G	Linear feedrate F in mm/min or inch/min and degree/min	m	+		PGsl
G95	G	Revolutional feedrate F in mm/rev or inch/rev	m	+		PGsl
G96	G	Revolutional feedrate (as for G95) and constant cutting rate	m	+		PGsl
G97	G	Revolutional feedrate and constant spindle speed (constant cutting rate OFF)	m	+		PGsl
G110	G	Pole programming relative to the last programmed setpoint position	s	+		PGsl
G111	G	Pole programming relative to zero of current workpiece coordinate system	s	+		PGsl
G112	G	Pole programming relative to the last valid pole	s	+		PGsl
G140 ⁶⁾	G	SAR approach direction defined by G41/G42	m	+		PGsl
G141	G	SAR approach direction to left of contour	m	+		PGsl
G142	G	SAR approach direction to right of contour	m	+		PGsl
G143	G	SAR approach direction tangent-dependent	m	+		PGsl
G147	G	Soft approach with straight line	s	+		PGsl
G148	G	Soft retraction with straight line	s	+		PGsl
G153	G	Suppression of current frames including basic frame	s	+		PGsl
G247	G	Soft approach with quadrant	s	+		PGsl
G248	G	Soft retraction with quadrant	s	+		PGsl
G290 ⁶⁾	G	Switch over to SINUMERIK mode ON	m	+		FBWsl
G291	G	Switch over to ISO2/3 mode ON	m	+		FBWsl
G331	G	Rigid tapping, positive lead, clockwise	m	+		PGsl
G332	G	Rigid tapping, negative lead, counter-clockwise	m	+		PGsl
G335	G	Turning a convex thread in clockwise direction	m	+		PGsl
G336	G	Turning a convex thread in counter-clockwise direction	m	+		PGsl
G340 ⁶⁾	G	Spatial approach block (depth and in plane at the same time (helix))	m	+		PGsl
G341	G	Initial infeed on perpendicular axis (z), then approach in plane	m	+		PGsl
G347	G	Soft approach with semicircle	s	+		PGsl
G348	G	Soft retraction with semicircle	s	+		PGsl

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
G450 ⁶⁾	G	Transition circle	m	+		PGsl
G451	G	Intersection of equidistances	m	+		PGsl
G460 ⁶⁾	G	Activation of collision detection for the approach and retraction block	m	+		PGsl
G461	G	Insertion of a circle into the TRC block	m	+		PGsl
G462	G	Insertion of a straight line into the TRC block	m	+		PGsl
G500 ⁶⁾	G	Deactivation of all adjustable frames, basic frames are active	m	+		PGsl
G505 ... G599	G	5 ... 99 Settable work offset	m	+		PGsl
G601 ⁶⁾	G	Block change at exact stop fine	m	+		PGsl
G602	G	Block change at exact stop coarse	m	+		PGsl
G603	G	Block change at IPO block end	m	+		PGsl
G621	G	Corner deceleration at all corners	m	+		PGAsl
G641	G	Continuous-path mode with smoothing as per distance criterion (= programmable rounding clearance)	m	+		PGsl
G642	G	Continuous-path mode with smoothing within the defined tolerances	m	+		PGsl
G643	G	Continuous-path mode with smoothing within the defined tolerances (block-internal)	m	+		PGsl
G644	G	Continuous-path mode with smoothing with maximum possible dynamic response	m	+		PGsl
G645	G	Continuous-path mode with smoothing and tangential block transitions within the defined tolerances	m	+		PGsl
G700	G	Inch dimensions for geometric and technological specifications (lengths, feedrate)	m	+	+	PGsl
G710 ⁶⁾	G	Metric dimensions for geometric and technological specifications (lengths, feedrate)	m	+	+	PGsl
G810 ⁶⁾ , ..., G819	G	G group reserved for the OEM user		+		PGAsl
G820 ⁶⁾ , ..., G829	G	G group reserved for the OEM user		+		PGAsl
G931	G	Feedrate specified by means of traversing time, deactivate constant path velocity	m	+		
G942	G	Freeze linear feedrate and constant cutting rate or spindle speed	m	+		
G952	G	Freeze revolutional feedrate and constant cutting rate or spindle speed	m	+		
G961	G	Linear feedrate (as for G94) and constant cutting rate	m	+		PGsl
G962	G	Linear feedrate or revolutional feedrate and constant cutting rate	m	+		PGsl
G971	G	Linear feedrate and constant spindle speed (constant cutting rate OFF)	m	+		PGsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
G972	G	Linear feedrate or revolutional feedrate and constant spindle speed (constant cutting rate OFF)	m	+		PGsI
G973	G	Revolutional feedrate without spindle speed limitation and constant spindle speed (G97 without LIMS for ISO mode)	m	+		PGsI
GEOAX	P	Assign new channel axes to geometry axes 1 - 3		+	-	PGAsI
GET	P	Replace enabled axis between channels		+	+	PGAsI
GETACTT	F	Gets active tool from a group of tools with the same name		+	-	FBWsl
GETACTTD	F	Gets the T number associated with an absolute D number		+	-	PGAsI
GETD	P	Replace axis directly between channels		+	-	PGAsI
GETDNO	F	Returns the D number of a cutting edge (CE) of a tool (T)		+	-	PGAsI
GETEXET	P	Reading of the loaded T number		+	-	FBWsl
GETFREELOC	P	Find a free space in the magazine for a given tool		+	-	FBWsl
GETSELT	P	Return selected T number		+	-	FBWsl
GETT	F	Get T number for tool name		+	-	FBWsl
GETTCOR	F	Read out tool lengths and/or tool length components		+	-	PGAsI
GETTENV	F	Read T, D and DL numbers		+	-	PGAsI
GETVARAP	F	Read access rights to a system/user variable		+	-	PGAsI
GETVARDFT	F	Read default value of a system/user variable		+	-	PGAsI
GETVARLIM	F	Read limit values of a system/user variable		+	-	PGAsI
GETVARPHU	F	Read physical unit of a system/user variable		+	-	PGAsI
GETVARTYP	F	Read data type of a system/user variable		+	-	PGAsI
GFRAME0 ... GFRAME100	G	Activation of the grinding frame <n> of the data management in channel	m	+		PGsI
GOTO	K	Jump operation first forward then backward (direction initially to end of program and then to beginning of program)		+		PGAsI
GOTOB	K	Jump backward (toward the beginning of the program)		+		PGAsI
GOTOC	K	As GOTO, but suppress alarm 14080 "Jump destination not found"		+		PGAsI
GOTOF	K	Jump forward (toward the end of the program)		+		PGAsI
GOTOS	K	Jump back to beginning of program		+		PGAsI
GP	K	Keyword for the indirect programming of position attributes		+		PGAsI
GROUP_ ADDEND	C (T)	End of trial cut addition		+		PGAsI
GROUP_BEGIN	C (T)	Beginning of program group		+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
GROUP_END	C (T)	End of program group		+		PGAsl
GWPSOF	P	Deselect constant grinding wheel peripheral speed (GWPS)	s	+	-	PGsl
GWPSON	P	Select constant grinding wheel peripheral speed (GWPS)	s	+	-	PGsl
H...	O	Auxiliary function output to the PLC		+	+	PGsl/FB1sl (H2)
HOLES1	C (T)	Row of holes		+		PGAsl
HOLES2	C (T)	Circle of holes		+		PGAsl
I	O	Interpolation parameters	s	+		PGsl
I1	O	Intermediate point coordinate	s	+		PGsl
IC	K	Incremental dimensions	s	+		PGsl
ICYCOF	P	All blocks of a technology cycle are processed in one interpolation cycle following ICYCOF		+	+	FBSYsl
ICYCON	P	Each block of a technology cycle is processed in a separate interpolation cycle following ICYCON		+	+	FBSYsl
ID	K	Identifier for modal synchronized actions	m	-	+	FBSYsl
IDS	K	Identifier for modal static synchronized actions		-	+	FBSYsl
IF	K	Introduction of a conditional jump in the part program/technology cycle		+	+	PGAsl
INDEX	F	Define index of character in input string		+	-	PGAsl
INICF	K	Initialization of variables for NEWCONF		+		PGAsl
INIPO	K	Initialization of variables at POWER ON		+		PGAsl
INIRE	K	Initialization of variables at reset		+		PGAsl
INIT	P	Selection of a particular NC program for execution in a particular channel		+	-	PGAsl
INITIAL		Generation of an INI file across all areas		+		PGAsl
INT	K	Data type: Integer with sign		+		PGAsl
INTERSEC	F	Calculate intersection between two contour elements		+	-	PGAsl
INVCCW	G	Trace involute, counter-clockwise	m	+		PGsl
INVCW	G	Trace involute, clockwise	m	+		PGsl
INVFRAME	F	Calculate the inverse frame from a frame		+	-	FB1sl (K2)
IP	K	Variable interpolation parameter		+		PGAsl
IPOBRKA	P	Motion criterion from braking ramp activation	m	+	+	
IPOENDA	K	End of motion when "IPO stop" reached	m	+		PGAsl
IPTRLOCK	P	Freeze start of the untraceable program section at next machine function block.	m	+	-	PGAsl
IPTRUNLOCK	P	Set end of untraceable program section at current block at time of interruption.	m	+	-	PGAsl
IR	O	Center of circle coordinate (X axis) when turning a convex thread		+		PGsl
ISAXIS	F	Check if geometry axis 1 specified as parameter		+	-	PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
ISD	O	Insertion depth	m	+		PGAsI
ISFILE	F	Check whether the file exists in the NC application memory		+	-	PGAsI
ISNUMBER	F	Check whether the input string can be converted to a number		+	-	PGAsI
ISOCALL	K	Indirect call of a program programmed in an ISO language		+		PGAsI
ISVAR	F	Check whether the transfer parameter contains a variable declared in the NC		+	-	PGAsI
J	O	Interpolation parameters	s	+		PGsI
J1	O	Intermediate point coordinate	s	+		PGsI
JERKA	P	Activate acceleration response set via MD for programmed axes		+	-	
JERKLIM	K	Reduction or overshoot of maximum axial jerk	m	+		PGAsI
JERKLIMA	K	Reduction or overshoot of maximum axial jerk	m	+	+	PGAsI
JR	O	Center of circle coordinate (Y axis) when turning a convex thread		+		PGsI
K	O	Interpolation parameters	s	+		PGsI
K1	O	Intermediate point coordinate	s	+		PGsI
KONT	G	Travel around contour on tool offset	m	+		PGsI
KONTC	G	Approach/retract with continuous-curvature polynomial	m	+		PGsI
KONTT	G	Approach/retract with continuous-tangent polynomial	m	+		PGsI
KR	O	Center of circle coordinate (Z axis) when turning a convex thread		+		PGsI
L	O	Subprogram number	s	+	+	PGAsI
LEAD	O	Lead angle 1st basic tool orientation 2nd orientation polynomials	m	+		PGAsI
LEADOF	P	Axial master value coupling OFF		+	+	PGAsI
LEADON	P	Axial master value coupling on		+	+	PGAsI
LENTOAX	F	Provides information about the assignment of tool lengths L1, L2, and L3 of the active tool to the abscissa, ordinate and applicate		+	-	PGAsI
LFOF ⁶⁾	G	Fast retraction for thread cutting OFF	m	+		PGsI
LFON	G	Fast retraction for thread cutting ON	m	+		PGsI
LFPOS	G	Retraction of the axis declared with POLF-MASK or POLFMLIN to the absolute axis position programmed with POLF	m	+		PGsI
LFTXT ⁶⁾	G	The plane of the retraction movement for fast retraction is determined from the path tangent and the current tool direction	m	+		PGsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
LFWP	G	The plane of the retraction movement for fast retraction is determined by the current working plane (G17/G18/G19)	m	+		PGsl
LIFTFAST	K	Fast retraction		+		PGsl
LIMS	K	Speed limitation for G96/G961 and G97	m	+		PGsl
LLI	K	Lower limit value of variables		+		PGAsl
LN	F	Natural logarithm		+	+	PGAsl
LOCK	P	Disable synchronized action with ID (stop technology cycle)		-	+	FBSYsl
LONGHOLE	C (T)	Elongated hole		+		PGAsl
LOOP	K	Introduction of an endless loop		+		PGAsl

Operations M ... R

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
M0		Programmed stop		+	+	PGsl
M1		Optional stop		+	+	PGsl
M2		End of program, main program (as M30)		+	+	PGsl
M3		CW spindle rotation		+	+	PGsl
M4		CCW spindle rotation		+	+	PGsl
M5		Spindle stop		+	+	PGsl
M6		Tool change		+	+	PGsl
M17		End of subprogram		+	+	PGsl
M19		Spindle positioning to the position entered in SD43240		+	+	PGsl
M30		End of program, main program (as M2)		+	+	PGsl
M40		Automatic gear change		+	+	PGsl
M41 ... M45		Gear stage 1 ... 5		+	+	PGsl
M70		Transition to axis mode		+	+	PGsl
MASLDEF	P	Define master/slave axis grouping		+	+	PGAsl
MASLDEL	P	Uncouple master/slave axis grouping and clear grouping definition		+	+	PGAsl
MASLOF	P	Deactivation of a temporary coupling		+	+	PGAsl
MASLOFS	P	Deactivation of a temporary coupling with automatic slave axis stop		+	+	PGAsl
MASLON	P	Activation of a temporary coupling		+	+	PGAsl
MATCH	F	Search for string in string		+	-	PGAsl
MAXVAL	F	Larger value of two variables (arithm. function)		+	+	PGAsl
MCALL	K	Modal subprogram call		+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
MEAC	K	Continuous axial measurement without delete distance-to-go	s	+	+	PGAsI
MEAFRAME	F	Frame calculation from measuring points		+	-	PGAsI
MEAS	O	Measurement with deletion of distance-to-go	s	+		PGAsI
MEASA	K	Axial measurement with delete distance-to-go	s	+	+	PGAsI
MEASURE	F	Calculation method for workpiece and tool measurement		+	-	FB1sI (M5)
MEAW	O	Measurement without delete distance-to-go	s	+		PGAsI
MEAWA	K	Axial measurement without delete distance-to-go	s	+	+	PGAsI
MI	K	Access to frame data: Mirroring		+		PGAsI
MINDEX	F	Define index of character in input string		+	-	PGAsI
MINVAL	F	Smaller value of two variables (arithm. function)		+	+	PGAsI
MIRROR	G	Programmable mirroring	s	+		PGAsI
MMC	P	Call the dialog window interactively from the part program on the HMI		+	-	PGAsI
MOD	K	Modulo division		+		PGAsI
MODAXVAL	F	Determine modulo position of a modulo rotary axis		+	-	PGAsI
MOV	K	Start positioning axis		-	+	FBSYsI
MOVT	O	Specify end point of a traversing motion in the tool direction				FB1(K2)
MSG	P	Programmable messages	m	+	-	PGsI
MVTOOL	P	Language command to move tool		+	-	FBWsI
N	O	NC auxiliary block number		+		PGsI
NAMETOINT	F	Determining the system variable index		+		PGAsI
NC	K	Specify validity range for data		+		PGAsI
NEWCONF	P	Apply modified machine data (corresponds to "Activate machine data")		+	-	PGAsI
NEWMT	F	Create new multitool		+	-	FBWsI
NEWT	F	Create new tool		+	-	FBWsI
NORM ⁶⁾	G	Standard setting in starting point and end point with tool offset	m	+		PGsI
NOT	K	Logic NOT (negation)		+		PGAsI
NPROT	P	Machine-specific protection area ON/OFF		+	-	PGAsI
NPROTDEF	P	Definition of a machine-specific protection area		+	-	PGAsI
NUMBER	F	Convert input string to number		+	-	PGAsI
OEMIPO1	G	OEM interpolation 1	m	+		PGAsI
OEMIPO2	G	OEM interpolation 2	m	+		PGAsI
OF	K	Keyword in CASE branch		+		PGAsI
OFFN	O	Allowance on the programmed contour	m	+		PGsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
OMA1	O	OEM address 1	m	+		PGAsl
OMA2	O	OEM address 2	m	+		PGAsl
OMA3	O	OEM address 3	m	+		PGAsl
OMA4	O	OEM address 4	m	+		PGAsl
OMA5	O	OEM address 5	m	+		PGAsl
OR	K	Logic operator, OR operation		+		PGAsl
ORIXES	G	Linear interpolation of machine axes or orientation axes	m	+		PGAsl
ORIXPOS	G	Orientation angle via virtual orientation axes with rotary axis positions	m	+		PGAsl
ORIC ⁶⁾	G	Orientation changes at outside corners are superimposed on the circle block to be inserted	m	+		PGAsl
ORICONCCW	G	Interpolation on a circular peripheral surface in CCW direction	m	+		PGAsl/FB3sl (F3)
ORICONCW	G	Interpolation on a circular peripheral surface in CW direction	m	+		PGAsl/FB3sl (F4)
ORICONIO	G	Interpolation on a circular peripheral surface with intermediate orientation setting	m	+		PGAsl/FB3sl (F4)
ORICONTO	G	Interpolation on circular peripheral surface in tangential transition (final orientation)	m	+		PGAsl/FB3sl (F5)
ORICURVE	G	Interpolation of orientation with specification of motion of two contact points of tool	m	+		PGAsl/FB3sl (F6)
ORID	G	Orientation changes are performed before the circle block	m	+		PGAsl
ORIEULER ⁶⁾	G	Orientation angle via Euler angle	m	+		PGAsl
ORIMKS	G	Tool orientation in the machine coordinate system	m	+		PGAsl
ORIPATH	G	Tool orientation in relation to path	m	+		PGAsl
ORIPATHS	G	Tool orientation in relation to path, blips in the orientation characteristic are smoothed	m	+		PGAsl
ORIPANE	G	Interpolation in a plane (corresponds to ORIVECT), large-radius circular interpolation	m	+		PGAsl
ORIRESET	P	Initial tool orientation with up to 3 orientation axes		+	-	PGAsl
ORIROTA ⁶⁾	G	Angle of rotation to an absolute direction of rotation	m	+		PGAsl
ORIROTC	G	Tangential rotational vector in relation to path tangent	m	+		PGAsl
ORIROTR	G	Angle of rotation relative to the plane between the start and end orientation	m	+		PGAsl
ORIROTT	G	Angle of rotation relative to the change in the orientation vector	m	+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
ORIRPY	G	Orientation angle via RPY angle (XYZ)	m	+		PGAsI
ORIRPY2	G	Orientation angle via RPY angle (ZYX)	m	+		PGAsI
ORIS	O	Change in orientation	m	+		PGAsI
ORISOF ⁶⁾	G	Smoothing of the orientation characteristic OFF	m	+		PGAsI
ORISOLH	F	Calculate orientations		+		PGAsI
ORISON	G	Smoothing of the orientation characteristic ON	m	+		PGAsI
ORIVECT ⁶⁾	G	Large-circle interpolation (identical to ORI-PLANE)	m	+		PGAsI
ORIVIRT1	G	Orientation angle via virtual orientation axes (definition 1)	m	+		PGAsI
ORIVIRT2	G	Orientation angle via virtual orientation axes (definition 1)	m	+		PGAsI
ORIWKS ⁶⁾	G	Tool orientation in the workpiece coordinate system	m	+		PGAsI
OS	K	Oscillation on/off		+		PGAsI
OSB	K	Oscillating: Starting point	m	+		FB1sl (P5)
OSC	G	Continuous tool orientation smoothing	m	+		PGAsI
OSCILL	K	Axis: 1 - 3 infeed axes	m	+		PGAsI
OSCTRL	K	Oscillation options	m	+		PGAsI
OSD	G	Smoothing of tool orientation by specifying smoothing distance with SD	m	+		PGAsI
OSE	K	Oscillation end position	m	+		PGAsI
OSNSC	K	Oscillating: Number of spark-out cycles	m	+		PGAsI
OSOF ⁶⁾	G	Tool orientation smoothing OFF	m	+		PGAsI
OSP1	K	Oscillating: Left reversal point	m	+		PGAsI
OSP2	K	Oscillation right reversal point	m	+		PGAsI
OSS	G	Tool orientation smoothing at end of block	m	+		PGAsI
OSSE	G	Tool orientation smoothing at start and end of block	m	+		PGAsI
OST	G	Smoothing of tool orientation by specifying angular tolerance in degrees with SD (maximum deviation from programmed orientation characteristic)	m	+		PGAsI
OST1	K	Oscillating: Stopping point in left reversal point	m	+		PGAsI
OST2	K	Oscillating: Stopping point in right reversal point	m	+		PGAsI
OTOL	A	Orientation tolerance for compressor functions, orientation smoothing and smoothing types	m	+		PGAsI
OVR	K	Speed offset	m	+		PGAsI
OVRA	K	Axial speed offset	m	+	+	PGAsI
OVRRAP	K	Rapid traverse override	m	+		PGAsI
P	O	Number of subprogram repetitions		+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
PAROT	G	Align workpiece coordinate system on workpiece	m	+		PGsl
PAROTOF ⁶⁾	G	Deactivate frame rotation in relation to workpiece	m	+		PGsl
PCALL	K	Call subprograms with absolute path and parameter transfer		+		PGAsl
PDELAYOF	G	Punching with delay OFF	m	+		PGAsl
PDELAYON ⁶⁾	G	Punching with delay ON	m	+		PGAsl
PHI	K	Angle of rotation of the orientation around the direction axis of the taper		+		PGAsl
PHU	K	Physical unit of a variable		+		PGAsl
PL	O	1. B spline: Node clearance 2. Polynomial interpolation Length of the parameter interval for polynomial interpolation	s	+		PGAsl
PM	K	Per minute		+		PGsl
PO	K	Polynomial coefficient for polynomial interpolation	s	+		PGAsl
POCKET3	C (T)	Milling the rectangular pocket		+		PGAsl
POCKET4	C (T)	Milling the circular pocket		+		PGAsl
POLF	K	LIFTFAST retraction position	m	+		PGsl/PGAsl
POLFA	P	Start retraction position of single axes with \$AA_ESR_TRIGGER	m	+	+	PGsl
POLFMASK	P	Enable axes for retraction without a connection between the axes	m	+	-	PGsl
POLFMLIN	P	Enable axes for retraction with a linear connection between the axes	m	+	-	PGsl
POLY	G	Polynomial interpolation	m	+		PGAsl
POLYPATH	P	Polynomial interpolation can be selected for the AXIS or VECT axis groups	m	+	-	PGAsl
PON	G	Punching ON	m	+		PGAsl
PONS	G	Punching ON in interpolation cycle	m	+		PGAsl
POS	K	Axis positioning		+	+	PGsl
POSA	K	Position axis across block boundary		+	+	PGsl
POSM	P	Position magazine		+	-	FBWsl
POSMT	P	Position multitool on toolholder at location number		+	-	FBWsl
POSP	K	Positioning axis in parts (oscillation)		+		PGsl
POSRANGE	F	Determine whether the currently interpolated position setpoint of an axis is located in a window at a predefined reference position		+	+	FBSYsl
POT	F	Square (arithmetic function)		+	+	PGAsl
PR	K	Per revolution		+		PGsl
PREPRO	PA	Identify subprograms with preparation		+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
PRESETON	P	Actual value setting with loss of the referencing status		+	+	PGAsI
PRESETONS	P	Actual value setting with loss of the referencing status		+	+	PGAsI
PRIO	K	Keyword for setting the priority for interrupt processing		+		PGAsI
PRLOC	K	Initialization of variables at reset only after local change		+		PGAsI
PROC	K	First operation in a program		+		PGAsI
PROTA	P	Request for a recalculation of the collision model		+		PGAsI
PROTD	F	Calculating the distance between two protection areas		+		PGAsI
PROTS	P	Setting the protection area status		+		PGAsI
PSI	K	Opening angle of the taper		+		PGAsI
PTP	G	Point-to-point motion (PTP travel)	m	+		PGAsI
PTPG0	G	Point-to-point motion only with G0, otherwise path motion CP	m	+		PGAsI
PTPWOC	G	Point-to-point motion without compensation movements caused by changes in orientation	m	+		PGAsI
PUNCHACC	P	Travel-dependent acceleration for nibbling		+	-	PGAsI
PUTFTOC	P	Tool fine offset for parallel dressing		+	-	PGAsI
PUTFTOCF	P	Tool fine offset dependent on a function for parallel dressing defined with FCTDEF		+	-	PGAsI
PW	O	B spline, point weight	s	+		PGAsI
QU	K	Fast additional (auxiliary) function output		+		PGsI
R...	O	Arithmetic parameter also as settable address identifier and with numerical extension		+		PGAsI
RAC	K	Absolute non-modal axis-specific radius programming	s	+		PGsI
RDISABLE	P	Read-in disable		-	+	FBSYsI
READ	P	Reads one or more lines in the specified file and stores the information read in the array		+	-	PGAsI
REAL	K	Data type: Floating-point variable with sign (real numbers)		+		PGAsI
REDEF	K	Redefinition of system variables, user variables, and NC language commands		+		PGAsI
RELEASE	P	Release machine axes for axis exchange		+	+	PGAsI
REP	K	Keyword for initialization of all elements of an array with the same value		+		PGAsI
REPEAT	K	Repetition of a program loop		+		PGAsI
REPEATB	K	Repetition of a program line		+		PGAsI
REPOSA	G	Linear repositioning with all axes	s	+		PGAsI
REPOSH	G	Repositioning with semicircle	s	+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
REPOSHA	G	Repositioning with all axes; geometry axes in semicircle	s	+		PGAsl
REPOSL	G	Linear repositioning	s	+		PGAsl
REPOSQ	G	Repositioning in a quadrant	s	+		PGAsl
REPOSQA	G	Linear repositioning with all axes, geometry axes in quadrant	s	+		PGAsl
RESETMON	P	Language command for setpoint activation		+	-	FBWsl
RET	P	End of subprogram		+	+	PGAsl
RETB	P	End of subprogram		+	+	PGAsl
RIC	K	Relative non-modal axis-specific radius programming	s	+		PGsl
RINDEX	F	Define index of character in input string		+	-	PGAsl
RMB	G	Repositioning to start of block	m	+		PGAsl
RMBBL	G	Repositioning to start of block	s	+		PGAsl
RME	G	Repositioning to end of block	m	+		PGAsl
RMEBL	G	Repositioning to end of block	s	+		PGAsl
RMI ⁶⁾	G	Repositioning to interrupt point	m	+		PGAsl
RMIBL ⁶⁾	G	Repositioning to interrupt point	s	+		PGAsl
RMN	G	Repositioning to the nearest path point	m	+		PGAsl
RMNBL	G	Repositioning to the nearest path point	s	+		PGAsl
RND	O	Round the contour corner	s	+		PGsl
RNDM	O	Modal rounding	m	+		PGsl
ROT	G	Programmable rotation	s	+		PGsl
ROTS	G	Programmable frame rotations with solid angles	s	+		PGsl
ROUND	F	Rounding of decimal places		+	+	PGAsl
ROUNDUP	F	Rounding up of an input value		+	+	PGAsl
RP	O	Polar radius	m/s	+		PGsl
RPL	O	Rotation in the plane	s	+		PGsl
RT	K	Parameter for access to frame data: Rotation		+		PGAsl
RTLIOF	G	G0 without linear interpolation (single-axis interpolation)	m	+		PGsl
RTLION ⁶⁾	G	G0 with linear interpolation	m	+		PGsl

21.1 Operations

Operations S ... Z

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
S	A	Spindle speed (with G4, G96/G961 different meaning)	m/s	+	+	PGsI
SAVE	PA	Attribute for saving information when subprograms are called		+		PGAsI
SBLOF	P	Suppress single block		+	-	PGAsI
SBLON	P	Revoke suppression of single block		+	-	PGAsI
SC	K	Parameter for access to frame data: Scaling		+		PGAsI
SCALE	G	Programmable scaling	s	+		PGsI
SCC	K	Selective assignment of transverse axis to G96/G961/G962. Axis identifiers may take the form of geometry, channel or machine axes.		+		PGsI
SCPARA	K	Program servo parameter set		+	+	PGAsI
SD	A	Spline degree	s	+		PGAsI
SET	K	Keyword for initialization of all elements of an array with listed values		+		PGAsI
SETAL	P	Set alarm		+	+	PGAsI
SETDNO	F	Assign the D number of a cutting edge (CE) of a tool (T)		+	-	PGAsI
SETINT	K	Define which interrupt routine is to be activated when an NC input is present		+		PGAsI
SETM	P	Setting of markers in dedicated channel		+	+	PGAsI
SETMS	P	Reset to the master spindle defined in machine data		+	-	PGsI
SETMS(n)	P	Set spindle n as master spindle		+		PGsI
SETMTH	P	Set master toolholder number		+	-	FBWsl
SETPIECE	P	Set piece number for all tools assigned to the spindle		+	-	FBWsl
SETTA	P	Activate tool from wear group		+	-	FBWsl
SETTCOR	F	Modification of tool components taking all supplementary conditions into account		+	-	PGAsI
SETTIA	P	Deactivate tool from wear group		+	-	FBWsl
SF	A	Starting point offset for thread cutting	m	+		PGsI
SIN	F	Sine (trigon. function)		+	+	PGAsI
SIRELAY	F	Activate the safety functions parameterized with SIRELIN, SIRELOUT, and SIRELTIME		-	+	FBSIsI
SIRELIN	P	Initialize input variables of function block		+	-	FBSIsI
SIRELOUT	P	Initialize output variables of function block		+	-	FBSIsI
SIRELTIME	P	Initialize timers of function block		+	-	FBSIsI
SLOT1	C (T)	Longitudinal groove		+		PGAsI
SLOT2	C (T)	Circumferential groove		+		PGAsI
SOFT	G	Soft path acceleration	m	+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
SOFTA	P	Activate jerk-limited axis acceleration for the programmed axes		+	-	PGAsl
SON	G	Nibbling ON	m	+		PGAsl
SONS	G	Nibbling ON in interpolation cycle	m	+		PGAsl
SPATH ⁶⁾	G	Path reference for FGROUP axes is arc length	m	+		PGAsl
SPCOF	P	Switch master spindle or spindle(s) from position control to speed control	m	+	-	PGsl
SPCON	P	Switch master spindle or spindle(s) from speed control to position control	m	+	-	PGAsl
SPI	F	Converts spindle number into axis identifier		+	-	PGAsl
SPIF1 ⁶⁾	G	Fast NC inputs/outputs for punching/nibbling byte 1	m	+		FB2sl (N4)
SPIF2	G	Fast NC inputs/outputs for punching/nibbling byte 2	m	+		FB2sl (N4)
SPLINEPATH	P	Define spline grouping		+	-	PGAsl
SPN	A	Number of path sections per block	s	+		PGAsl
SPOF ⁶⁾	G	Stroke OFF, nibbling, punching OFF	m	+		PGAsl
SPOS	K	Spindle position	m	+	+	PGsl
SPOSA	K	Spindle position across block boundaries	m	+		PGsl
SPP	A	Length of a path section	m	+		PGAsl
SPRINT	F	Returns an input string formatted		+		PGAsl
SQRT	F	Square root (arithmetic function)		+	+	PGAsl
SR	A	Oscillation retraction path for synchronized action	s	+		PGsl
SRA	K	Oscillation retraction path with external input axial for synchronized action	m	+		PGsl
ST	A	Oscillation sparking-out time for synchronized action	s	+		PGsl
STA	K	Oscillation sparking-out time axial for synchronized action	m	+		PGsl
START	P	Start selected programs simultaneously in several channels from current program		+	-	PGAsl
STARTFIFO ⁶⁾	G	Execute; fill preprocessing memory simultaneously	m	+		PGAsl
STAT		Position of joints	s	+		PGAsl
STOLF	K	G0 tolerance factor	m	+		PGAsl
STOPFIFO	G	Stop machining; fill preprocessing memory until STARTFIFO is detected, preprocessing memory is full or end of program	m	+		PGAsl
STOPRE	P	Preprocessing stop until all prepared blocks in the main run are executed		+	-	PGAsl
STOPREOF	P	Revoke preprocessing stop		-	+	FBSYsl
STRING	K	Data type: Character string		+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
STRINGIS	F	Checks the present scope of NC language and the NC cycle names, user variables, macros, and label names belonging specifically to this command to establish whether these exist, are valid, defined or active.		+	-	PGAsI
STRLEN	F	Define string length		+	-	PGAsI
SUBSTR	F	Define index of character in input string		+	-	PGAsI
SUPA	G	Suppression of current zero offset, including programmed offsets, system frames, hand-wheel offsets (DRF), external zero offset, and overlaid movement	s	+		PGsI
SVC	K	Tool cutting rate	m	+		PGsI
SYNFCT	P	Evaluation of a polynomial as a function of a condition in the motion-synchronous action		-	+	FBSYsI
SYNR	K	The variable is read synchronously, i.e. at the time of execution		+		PGAsI
SYNRW	K	The variable is read and written synchronously, i.e. at the time of execution		+		PGAsI
SYNW	K	The variable is written synchronously, i.e. at the time of execution		+		PGAsI
T	A	Call tool (only change if specified in machine data; otherwise M6 command necessary)		+		PGsI
TAN	F	Tangent (trigon. function)		+	+	PGAsI
TANG	P	Tangential control: Define coupling		+	-	PGAsI
TANGDEL	P	Tangential control: Delete coupling		+	-	PGAsI
TANGOF	P	Tangential control: Deactivate coupling		+	-	PGAsI
TANGON	P	Tangential control: Activate coupling		+	-	PGAsI
TCA (828D: _TCA)	P	Tool selection/tool change irrespective of tool status		+	-	FBWsI
TCARR	A	Request toolholder (number "m")		+		PGAsI
TCI	P	Load tool from buffer into magazine		+	-	FBWsI
TCOABS ⁶⁾	G	Determine tool length components from the current tool orientation	m	+		PGAsI
TCOFR	G	Determine tool length components from the orientation of the active frame	m	+		PGAsI
TCOFRX	G	Determine tool orientation of an active frame on selection of tool, tool points in X direction	m	+		PGAsI
TCOFRY	G	Determine tool orientation of an active frame on selection of tool, tool points in Y direction	m	+		PGAsI
TCOFRZ	G	Determine tool orientation of an active frame on selection of tool, tool points in Z direction	m	+		PGAsI
THETA	A	Angle of rotation	s	+		PGAsI
TILT	A	Tilt angle	m	+		PGAsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
TLIFT	P	Tangential control: Activate intermediate block generation		+	-	PGAsl
TML	P	Tool selection with magazine location number		+	-	FBWsl
TMOF	P	Deselect tool monitoring		+	-	PGAsl
TMON	P	Activate tool monitoring		+	-	PGAsl
TO	K	Designates the end value in a FOR counter loop		+		PGAsl
TOFF	K	Tool length offset in the direction of the tool length component that is effective parallel to the geometry axis specified in the index.	m	+		PGsl
TOFFL	K	Tool length offset in the direction of the tool length component L1, L2 or L3	m	+		PGsl
TOFFOF	P	Deactivate online tool offset		+	-	PGAsl
TOFFON	P	Activate online tool length offset		+	-	PGAsl
TOFFR	A	Tool radius offset	m	+		PGsl
TOFRAME	G	Align Z axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOFRAMEX	G	Align X axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOFRAMEY	G	Align Y axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOFRAMEZ	G	As TOFRAME	m	+		PGsl
TOLOWER	F	Convert the letters of a string into lowercase		+	-	PGAsl
TOOLENV	F	Save current states which are of significance to the evaluation of the tool data stored in the memory		+	-	PGAsl
TOOLGNT	F	Determine number of tools of a tool group		+	-	FBWsl
TOOLGT	F	Determine T number of a tool from a tool group		+	-	FBWsl
TOROT	G	Align Z axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOROTOF ⁶⁾	G	Frame rotations in tool direction OFF	m	+		PGsl
TOROTX	G	Align X axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOROTY	G	Align Y axis of the WCS by rotating the frame parallel to the tool orientation	m	+		PGsl
TOROTZ	G	As TOROT	m	+		PGsl
TOUPPER	F	Convert the letters of a string into uppercase		+	-	PGAsl
TOWBCS	G	Wear values in the basic coordinate system (BCS)	m	+		PGAsl
TOWKCS	G	Wear values in the coordinate system of the tool head for kinetic transformation (differs from machine coordinate system through tool rotation)	m	+		PGAsl
TOWMCS	G	Wear values in machine coordinate system	m	+		PGAsl
TOWSTD ⁶⁾	G	Initial setting value for offsets in tool length	m	+		PGAsl

21.1 Operations

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
TOWTCS	G	Wear values in the tool coordinate system (toolholder ref. point T at the tool holder)	m	+		PGAsI
TOWWCS	G	Wear values in workpiece coordinate system	m	+		PGAsI
TR	K	Offset component of a frame variable		+		PGAsI
TRAANG	P	Transformation inclined axis		+	-	PGAsI
TRACON	P	Cascaded transformation		+	-	PGAsI
TRACYL	P	Cylinder: Peripheral surface transformation		+	-	PGAsI
TRAFOOF	P	Deactivate active transformations in the channel		+	-	PGAsI
TRAFOON	P	Activate transformation defined with kinematic chains		+	-	PGAsI
TRAILOF	P	Asynchronous coupled motion OFF		+	+	PGAsI
TRAILON	P	Asynchronous coupled motion ON		+	+	PGAsI
TRANS	G	Absolute programmable work offset	s	+		PGsI
TRANSMIT	P	Pole transformation (face machining)		+	-	PGAsI
TRAORI	P	4-axis, 5-axis transformation, generic transformation		+	-	PGAsI
TRUE	K	Logical constant: True		+		PGAsI
TRUNC	F	Truncation of decimal places		+	+	PGAsI
TU		Axis angle	s	+		PGAsI
TURN	A	Number of turns for helix	s	+		PGsI
ULI	K	Upper limit value of variables		+		PGAsI
UNLOCK	P	Enable synchronized action with ID (continue technology cycle)		-	+	FBSYsI
UNTIL	K	Condition for end of REPEAT loop		+		PGAsI
UPATH	G	Path reference for FGROUP axes is curve parameter	m	+		PGAsI
VAR	K	Keyword: Type of parameter transfer		+		PGAsI
VELOLIM	K	Reduction of the maximum axial velocity	m	+		PGAsI
VELOLIMA	K	Reduction or increase of the maximum axial velocity of the following axis	m	+	+	PGAsI
WAITC	P	Wait for the coupling block change criterion to be fulfilled for the axes/spindles		+	-	PGAsI
WAITE	P	Wait for end of program in another channel.		+	-	PGAsI
WAITENC	P	Wait for synchronized or restored axis positions		+	-	PGAsI
WAITM	P	Wait for marker in specified channel; terminate previous block with exact stop.		+	-	PGAsI
WAITMC	P	Wait for marker in specified channel; exact stop only if the other channels have not yet reached the marker.		+	-	PGAsI
WAITP	P	Wait for end of travel of the positioning axis		+	-	PGsI
WAITS	P	Wait for spindle position to be reached		+	-	PGsI

Operation	Type ¹⁾	Meaning	W ²⁾	TP ³⁾	SA ⁴⁾	Description see ⁵⁾
1) 2) 3) 4) 5) for explanations, see legend (Page 858).						
WALCS0 ⁶⁾	G	Workpiece coordinate system working area limitation deselected	m	+	-	PGsl
WALCS1	G	WCS working area limitation group 1 active	m	+	-	PGsl
WALCS2	G	WCS working area limitation group 2 active	m	+	-	PGsl
WALCS3	G	WCS working area limitation group 3 active	m	+	-	PGsl
WALCS4	G	WCS working area limitation group 4 active	m	+	-	PGsl
WALCS5	G	WCS working area limitation group 5 active	m	+	-	PGsl
WALCS6	G	WCS working area limitation group 6 active	m	+	-	PGsl
WALCS7	G	WCS working area limitation group 7 active	m	+	-	PGsl
WALCS8	G	WCS working area limitation group 8 active	m	+	-	PGsl
WALCS9	G	WCS working area limitation group 9 active	m	+	-	PGsl
WALCS10	G	WCS working area limitation group 10 active	m	+	-	PGsl
WALIMOF	G	BCS working area limitation OFF	m	+	-	PGsl
WALIMON ⁶⁾	G	BCS working area limitation ON	m	+	-	PGsl
WHEN	K	The action is executed once whenever the condition is fulfilled.		-	+	FBSYsl
WHENEVER	K	The action is executed cyclically in each interpolator cycle when the condition is fulfilled.		-	+	FBSYsl
WHILE	K	Start of WHILE program loop		+		PGAsl
WRITE	P	Write text to file system. Appends a block to the end of the specified file.		+	-	PGAsl
WRTPR	P	Write string in OPI variable		+	-	PGsl
X	A	Axis name	m/s	+	+	PGsl
XOR	O	Logic exclusive OR		+		PGAsl
Y	A	Axis name	m/s	+	+	PGsl
Z	A	Axis name	m/s	+	+	PGsl

Legend	
--------	--

1) Type of operation:

A Address

Identifier to which a value is assigned (e.g. OVR=10). There are also some addresses that switch on or off a function without value assignment (e.g. CPLON and CPLOF).

C (A) AST cycle

Predefined NC program for automatic post optimization (tuning) with AST (= Automatic Servo Tuning). Parameters are used to adapt to the specific optimization situation; these parameters are transferred at the call.

C (M) Measuring cycle

Predefined NC program in which a specific, generally valid, measuring operation, such as determining the inner diameter of a cylindrical workpiece, is programmed. Parameters are used to adapt to the specific measurement situation; these parameters are transferred at the call.

C (T) Technological cycle

Predefined NC program in which a specific, generally valid, machining operation, such as tapping of a thread or milling a pocket, is programmed. The adaptation to a specific machine situation is realized via parameters that are transferred to the cycle during the call.

F Predefined function (supplies a return value)

The call of the predefined function can be an operand in an expression.

G G command

The G commands are divided into G groups. Only one G command of a group can be programmed in a block. A G command can be either modal (until it is canceled by another command of the same group) or only effective for the block in which it is programmed (non-modal).

K Keyword

Identifier that defines the syntax of a block. No value is assigned to a keyword, and no NC function can be switched on/off with a keyword.

Examples: Control structures (IF, ELSE, ENDIF, WHEN, ...), program execution (GOTOB, GOTO, RET ...)

O Operator

Operator for a mathematical, comparison or logical operation

P Predefined procedure (does not supply a return value)

PA Program attribute

Program attributes are at the end of the definition line of a subprogram:

PROC <program name>(...) <program attribute>

They determine the behavior during execution of the subprogram.

2) Effectiveness of the operation:

m Modal

s Non-modal

3) Programmability in part program:

+ Programmable

- Not programmable

M Programmable only by the machine manufacturer

- 4) Programmability in synchronized actions:
- + Programmable
 - Not programmable
 - T Programmable only in technology cycles
- 5) Reference to the document containing the detailed description of the operation:
- | | |
|------------------|--|
| <i>PGsl</i> | Programming Manual, Fundamentals |
| <i>PGAsl</i> | Programming Manual, Job Planning |
| <i>BNMsl</i> | Programming Manual Measuring Cycles |
| <i>BHDsl</i> | Operating Manual, Turning |
| <i>BHFsl</i> | Operating Manual, Milling |
| <i>FB1sl</i> () | Function Manual, Basic Functions (with the alphanumeric abbreviation of the corresponding function description in brackets) |
| <i>FB2sl</i> () | Function Manual, Extended Functions (with the alphanumeric abbreviation of the corresponding function description in brackets) |
| <i>FB3sl</i> () | Function Manual, Special Functions (with the alphanumeric abbreviation of the corresponding function description in brackets) |
| <i>FBSsl</i> | Function Manual, Safety Integrated |
| <i>FBSYsl</i> | Function Manual, Synchronized Actions |
| <i>FBWsl</i> | Function Manual, Tool Management |
- 6) Default setting at beginning of program (factory settings of the control, if nothing else programmed).

Figure 21-1 Meaning of footnotes in the tables of operations

21.2 Operations: Availability for SINUMERIK 828D

Note

Cycles

Cycles are marked as "optional" if they depend on the following options that require a license:

- Extended technology functions (article number: 6FC5800-0AP58-0YB0)
- Measuring cycles (article number: 6FC5800-0AP28-0YB0)
- Measuring kinematics (article number: 6FC5800-0AP18-0YB0)
- SINUMERIK Grinding Advanced (article number: 6FC5800-0AS35-0YB0)

Not marked, if cycles only contain partial functionalities as a result of option "Extended technology functions".

21.3 Currently set language in the HMI

The table below lists all of the languages available at the user interface.

The currently set language can be queried in the part program and in the synchronized actions using the following system variable:

`$AN_LANGUAGE_ON_HMI = <value>`

<value>	Language	Language code
1	German (Germany)	GER
2	French	FRA
3	English (Great Britain)	ENG
4	Spanish	ESP
6	Italian	ITA
7	Dutch	NLD
8	Simplified Chinese	CHS
9	Swedish	SVE
18	Hungarian	HUN
19	Finnish	FIN
28	Czech	CSY
50	Portuguese (Brazil)	PTB
53	Polish	PLK
55	Danish	DAN
57	Russian	RUS
68	Slovakian	SKY
72	Rumanian	ROM
80	Traditional Chinese	CHT
85	Korean	KOR
87	Japanese	JPN
89	Turkish	TRK

Note

`$AN_LANGUAGE_ON_HMI` is updated:

- after the system boots.
- after NC and/or PLC reset.
- after switching over to another NC within the scope of M2N.
- after changing over the language on the HMI.

Appendix

A.1 List of abbreviations

A	
O	Output
ADI4	(Analog drive interface for 4 axes)
AC	Adaptive Control
ALM	Active Line Module
ARM	Rotating induction motor
AS	Automation system
ASCII	American Standard Code for Information Interchange: American coding standard for the exchange of information
ASIC	Application-Specific Integrated Circuit: User switching circuit
ASUB	Asynchronous subprogram
AUXFU	Auxiliary function: Auxiliary function
STL	Statement List
UP	User Program

B	
OP	Operating Mode
BAG	Mode group
BCD	Binary Coded Decimals: Decimal numbers encoded in binary code
BERO	Contact-less proximity switch
BI	Binector Input
BICO	Binector Connector
BIN	BINary files: Binary files
BIOS	Basic Input Output System
BCS	Basic Coordinate System
BO	Binector Output
OPI	Operator Panel Interface

C	
CAD	Computer-Aided Design
CAM	Computer-Aided Manufacturing
CC	Compile Cycle: Compile cycles
CEC	Cross Error Compensation
CI	Connector Input
CF Card	Compact Flash Card

C	
CNC	Computerized Numerical Control: Computer-Supported Numerical Control
CO	Connector Output
CoL	Certificate of License
COM	Communication
CPA	Compiler Projecting Data: Configuring data of the compiler
CRT	Cathode Ray Tube: picture tube
CSB	Central Service Board: PLC module
CU	Control Unit
CP	Communication Processor
CPU	Central Processing Unit: Central processing unit
CR	Carriage Return
CTS	Clear To Send: Ready to send signal for serial data interfaces
CUTCOM	Cutter radius Compensation: Tool radius compensation

D	
DAC	Digital-to-Analog Converter
DB	Data Block (PLC)
DBB	Data Block Byte (PLC)
DBD	Data Block Double word (PLC)
DBW	Data Block Word (PLC)
DBX	Data block bit (PLC)
DDE	Dynamic Data Exchange
DDS	Drive Data Set: Drive data set
DIN	Deutsche Industrie Norm
DIO	Data Input/Output: Data transfer display
DIR	Directory: Directory
DLL	Dynamic Link Library
DO	Drive Object
DPM	Dual Port Memory
DPR	Dual Port RAM
DRAM	Dynamic memory (non-buffered)
DRF	Differential Resolver Function: Differential revolver function (handwheel)
DRIVE-CLiQ	Drive Component Link with IQ
DRY	Dry Run: Dry run feedrate
DSB	Decoding Single Block: Decoding single block
DSC	Dynamic Servo Control / Dynamic Stiffness Control
DW	Data Word
DWORD	Double Word (currently 32 bits)

E	
I	Input
EES	Execution from External Storage
I/O	Input/Output
ENC	Encoder: Actual value encoder
EFM	Compact I/O module (PLC I/O module)
ESD	Electrostatic Sensitive Devices
EMC	ElectroMagnetic Compatibility
EN	European standard
ENC	Encoder: Actual value encoder
EnDat	Encoder interface
EPROM	Erasable Programmable Read Only Memory: Erasable, electrically programmable read-only memory
ePS Network Services	Services for Internet-based remote machine maintenance
EQN	Designation for an absolute encoder with 2048 sine signals per revolution
ES	Engineering System
ESR	Extended Stop and Retract
ETC	ETC key ">"; softkey bar extension in the same menu

F	
FB	Function Block (PLC)
FC	Function Call: Function Block (PLC)
FEPRM	Flash EPROM: Read and write memory
FIFO	First In First Out: Memory that works without address specification and whose data is read in the same order in which they was stored
FIPO	Fine interpolator
FPU	Floating Point Unit: Floating Point Unit
CRC	Cutter Radius Compensation
FST	Feed Stop: Feedrate stop
FBD	Function Block Diagram (PLC programming method)
FW	Firmware

G	
GC	Global Control (PROFIBUS: Broadcast telegram)
GDIR	Global part program memory
GEO	Geometry, e.g. geometry axis
GIA	Gear Interpolation dAta: Gear interpolation data
GND	Signal Ground
GP	Basic program (PLC)
GS	Gear Stage
GSD	Device master file for describing a PROFIBUS slave

G	
GSDML	Generic Station Description Markup Language: XML-based description language for creating a GSD file
GUD	Global User Data: Global user data

H	
HEX	Abbreviation for hexadecimal number
AuxF	Auxiliary function
HLA	Hydraulic linear drive
HMI	Human Machine Interface: SINUMERIK user interface
MSD	Main Spindle Drive
HW	Hardware

I	
IBN	Commissioning
ICA	Interpolatory compensation
IM	Interface Module: Interconnection module
IMR	Interface Module Receive: Interface module for receiving data
IMS	Interface Module Send: Interface module for sending data
INC	Increment: Increment
INI	Initializing Data: Initializing data
IPO	Interpolator
ISA	Industry Standard Architecture
ISO	International Standardization Organization

J	
JOG	Jogging: Setup mode

K	
K_v	Gain factor of control loop
K_p	Proportional gain
K_U	Transformation ratio
LAD	Ladder Diagram (PLC programming method)

L	
LAI	Logic Machine Axis Image: Logical machine axes image
LAN	Local Area Network
LCD	Liquid Crystal Display: Liquid crystal display
LED	Light Emitting Diode: Light-emitting diode
LF	Line Feed

L	
PMS	Position Measuring System
LR	Position controller
LSB	Least Significant Bit: Least significant bit
LUD	Local User Data: User data (local)

M	
MAC	Media Access Control
MAIN	Main program: Main program (OB1, PLC)
MB	Megabyte
MCI	Motion Control Interface
MCIS	Motion Control Information System
MCP	Machine Control Panel: Machine control panel
MD	Machine Data
MDA	Manual Data Automatic: Manual input
MDS	Motor Data Set: Motor data set
MSGW	Message Word
MCS	Machine Coordinate System
MM	Motor Module
MPF	Main Program File: Main program (NC)
MCP	Machine control panel

N	
NC	Numerical Control: Numerical control with block preparation, traversing range, etc.
NCU	Numerical Control Unit: NC hardware unit
NRK	Name for the operating system of the NC
IS	Interface Signal
NURBS	Non-Uniform Rational B-Spline
WO	Work Offset
NX	Numerical Extension: Axis expansion board

O	
OB	Organization block in the PLC
OEM	Original Equipment Manufacturer
OP	Operator Panel: Operating equipment
OPI	Operator Panel Interface: Interface for connection to the operator panel
OPT	Options: Options
OLP	Optical Link Plug: Fiber optic bus connector
OSI	Open Systems Interconnection: Standard for computer communications

P	
PIQ	Process Image Output
PII	Process Image Input
PC	Personal Computer
PCIN	Name of the SW for data exchange with the control
PCMCIA	Personal Computer Memory Card International Association: Plug-in memory card standardization
PCU	PC Unit: PC box (computer unit)
PG	Programming device
PKE	Parameter identification: Part of a PIV
PIV	Parameter identification: Value (parameterizing part of a PPO)
PLC	Programmable Logic Control: Adaptation control
PN	PROFINET
PNO	PROFIBUS user organization
PO	POWER ON
POU	Program Organization Unit
POS	Position/positioning
POSMO A	Positioning Motor Actuator: Positioning motor
POSMO CA	Positioning Motor Compact AC: Complete drive unit with integrated power and control module as well as positioning unit and program memory; AC infeed
POSMO CD	Positioning Motor Compact DC: Like CA but with DC infeed
POSMO SI	Positioning Motor Servo Integrated: Positioning motor, DC infeed
PPO	Parameter Process data Object: Cyclic data telegram for PROFIBUS DP transmission and "Variable speed drives" profile
PPU	Panel Processing Unit (central hardware for a panel-based CNC, e.g SINUMERIK 828D)
PROFIBUS	Process Field Bus: Serial data bus
PRT	Program Test
PSW	Program control word
PTP	Point-To-Point: Point-To-Point
PUD	Program global User Data: Program-global user variables
PZD	Process data: Process data part of a PPO

Q	
QEC	Quadrant Error Compensation

R	
RAM	Random Access Memory: Read/write memory
REF	REfERENCE point approach function
REPOS	REPOSition function
RISC	Reduced Instruction Set Computer: Type of processor with small instruction set and ability to process instructions at high speed
ROV	Rapid Override: Input correction

R	
RP	R Parameter, arithmetic parameter, predefined user variable
RPA	R Parameter Active: Memory area in the NC for R parameter numbers
RPY	Roll Pitch Yaw: Rotation type of a coordinate system
RTL	Rapid Traverse Linear Interpolation: Linear interpolation during rapid traverse motion
RTS	Request To Send: Control signal of serial data interfaces
RTCP	Real Time Control Protocol

S	
SA	Synchronized Action
SBC	Safe Brake Control: Safe Brake Control
SBL	Single Block: Single block
SBR	Subroutine: Subprogram (PLC)
SD	Setting Data
SDB	System Data Block
SEA	Setting Data Active: Identifier (file type) for setting data
SERUPRO	SEarch RUn by PROgram test: Block search, program test
SFB	System Function Block
SFC	System Function Call
SGE	Safety-related input
SGA	Safety-related output
SH	Safe standstill
SIM	Single in Line Module
SK	Softkey
SKP	Skip: Function for skipping a part program block
SLM	Synchronous Linear Motor
SM	Stepper Motor
SMC	Sensor Module Cabinet Mounted
SME	Sensor Module Externally Mounted
SMI	Sensor Module Integrated
SPF	Sub Routine File: Subprogram (NC)
PLC	Programmable Logic Controller
SRAM	Static RAM (non-volatile)
TNRC	Tool Nose Radius Compensation
SRM	Synchronous Rotary Motor
LEC	Leadscrew Error Compensation
SSI	Serial Synchronous Interface: Synchronous serial interface
SSL	Block search
STW	Control word
GWPS	Grinding Wheel Peripheral Speed
SW	Software
SYF	System Files: System files
SYNACT	SYNchronized ACTION: Synchronized Action

T	
TB	Terminal Board (SINAMICS)
TCP	Tool Center Point: Tool tip
TCP/IP	Transport Control Protocol / Internet Protocol
TCU	Thin Client Unit
TEA	Testing Data Active: Identifier for machine data
TIA	Totally Integrated Automation
TM	Terminal Module (SINAMICS)
TO	Tool Offset: Tool offset
TOA	Tool Offset Active: Identifier (file type) for tool offsets
TRANSMIT	Transform Milling Into Turning: Coordination transformation for milling operations on a lathe
TTL	Transistor-Transistor Logic (interface type)
TZ	Technology cycle

U	
UFR	User Frame: Work offset
SR	Subprogram
USB	Universal Serial Bus
UPS	Uninterruptible Power Supply

V	
VDI	Internal communication interface between NC and PLC
VDI	Verein Deutscher Ingenieure [Association of German Engineers]
VDE	Verband Deutscher Elektrotechniker [Association of German Electrical Engineers]
VI	Voltage Input
VO	Voltage Output
FDD	Feed Drive

W	
SAR	Smooth Approach and Retraction
WCS	Workpiece Coordinate System
T	Tool
TLC	Tool Length Compensation
WOP	Workshop-Oriented Programming
WPD	Workpiece Directory: Workpiece directory
TRC	Tool Radius Compensation
T	Tool
TO	Tool Offset
TM	Tool Management
TC	Tool change

X	
XML	Extensible Markup Language

Z	
WOA	Work Offset Active: Identifier for work offsets
ZSW	Status word (of drive)

A.2 Documentation overview

Glossary

Absolute dimensions

A destination for an axis motion is defined by a dimension that refers to the origin of the currently valid coordinate system. See → Incremental dimension

Acceleration with jerk limitation

In order to optimize the acceleration response of the machine whilst simultaneously protecting the mechanical components, it is possible to switch over in the machining program between abrupt acceleration and continuous (jerk-free) acceleration.

Address

An address is the identifier for a certain operand or operand range, e.g. input, output, etc.

Alarms

All → messages and alarms are displayed on the operator panel in plain text with date and time and the corresponding symbol for the deletion criterion. Alarms and messages are displayed separately.

1. Alarms and messages in the part program:
Alarms and messages can be displayed in plain text directly from the part program.
2. Alarms and messages from the PLC:
Alarms and messages for the machine can be displayed in plain text from the PLC program.
No additional function block packages are required for this purpose.

Archiving

Reading out of files and/or directories on an **external** memory device.

Asynchronous subprogram

Part program that can be started asynchronously to (independently of) the current program status using an interrupt signal (e.g. "Rapid NC input" signal).

Automatic

Operating mode of the controller (block sequence operation according to DIN): Operating mode for NC systems in which a → subprogram is selected and executed continuously.

Auxiliary functions

Auxiliary functions enable → part programs to transfer → parameters to the → PLC, which then trigger reactions defined by the machine manufacturer.

Axes

In accordance with their functional scope, the CNC axes are subdivided into:

- Axes: Interpolating path axes
- Auxiliary axes: Non-interpolating feed and positioning axes with an axis-specific feedrate. Auxiliary axes are not involved in actual machining, e.g. tool feeder, tool magazine.

Axis address

See → Axis name

Axis name

To ensure clear identification, all channel and → machine axes of the control system must be designated with unique names in the channel and control system. The → geometry axes are called X, Y, Z. The rotary axes rotating around the geometry axes → are called A, B, C.

Backlash compensation

Compensation for a mechanical machine backlash, e.g. backlash on reversal for ball screws. Backlash compensation can be entered separately for each axis.

Backup battery

The backup battery ensures that the → user program in the → CPU is stored so that it is safe from power failure and so that specified data areas and bit memory, timers and counters are stored retentively.

Basic axis

Axis whose setpoint or actual value position forms the basis of the calculation of a compensation value.

Basic Coordinate System

Cartesian coordinate system which is mapped by transformation onto the machine coordinate system.

The programmer uses axis names of the basic coordinate system in the → part program. The basic coordinate system exists parallel to the → machine coordinate system if no → transformation is active. The difference lies in the → axis names.

Baud rate

Rate of data transfer (bits/s).

Blank

Workpiece as it is before it is machined.

Block

"Block" is the term given to any files required for creating and processing programs.

Block search

For debugging purposes or following a program abort, the "Block search" function can be used to select any location in the part program at which the program is to be started or resumed.

Booting

Loading the system program after power ON.

C axis

Axis around which the tool spindle describes a controlled rotational and positioning motion.

C spline

The C spline is the most well-known and widely used spline. The transitions at the interpolation points are continuous, both tangentially and in terms of curvature. 3rd order polynomials are used.

Channel

A channel is characterized by the fact that it can process a → part program independently of other channels. A channel exclusively controls the axes and spindles assigned to it. Part program runs of different channels can be coordinated through → synchronization.

Circular interpolation

The → tool moves on a circle between specified points on the contour at a given feedrate, and the workpiece is thereby machined.

CNC

See → NC

Computerized Numerical Control: includes the components → NC, → PLC, HMI, → COM.

CNC

See → NC

Computerized Numerical Control: includes the components → NC, → PLC, HMI, → COM.

COM

Component of the NC for the implementation and coordination of communication.

Compensation axis

Axis with a setpoint or actual value modified by the compensation value

Compensation table

Table containing interpolation points. It provides the compensation values of the compensation axis for selected positions on the basic axis.

Compensation value

Difference between the axis position measured by the encoder and the desired, programmed axis position.

Continuous-path mode

The objective of continuous-path mode is to avoid substantial deceleration of the → path axes at the part program block boundaries and to change to the next block at as close to the same path velocity as possible.

Contour

Contour of the → workpiece

Contour monitoring

The following error is monitored within a definable tolerance band as a measure of contour accuracy. An unacceptably high following error can cause the drive to become overloaded, for example. In such cases, an alarm is output and the axes are stopped.

Coordinate system

See → Machine coordinate system, → Workpiece coordinate system

CPU

Central processing unit, see → PLC

CU

Transformation ratio

Curvature

The curvature k of a contour is the inverse of radius r of the nestling circle in a contour point ($k = 1/r$).

Cycles

Protected subprograms for execution of repetitive machining operations on the → workpiece.

Data block

1. Data unit of the → PLC that → HIGHSTEP programs can access.
2. Data unit of the → NC: Data blocks contain data definitions for global user data. This data can be initialized directly when it is defined.

Data word

Two-byte data unit within a → data block.

Diagnostics

1. Operating area of the control.
2. The control has a self-diagnostics program as well as test functions for servicing purposes: status, alarm, and service displays

Dimensions specification, metric and inches

Position and pitch values can be programmed in inches in the machining program. Irrespective of the programmable dimensions ($G70/G71$), the control is set to a basic system.

DRF

Differential Resolver Function: NC function which generates an incremental work offset in Automatic mode in conjunction with an electronic handwheel.

Drive

The drive is the unit of the CNC that performs the speed and torque control based on the settings of the NC.

Dynamic feedforward control

Inaccuracies in the → contour due to following errors can be practically eliminated using dynamic, acceleration-dependent feedforward control. This results in excellent machining accuracy even at high → path velocities. Feedforward control can be selected and deselected on an axis-specific basis via the → part program.

Editor

The editor makes it possible to create, edit, extend, join, and import programs / texts / program blocks.

Exact stop

When an exact stop statement is programmed, the position specified in a block is approached exactly and, if necessary, very slowly. To reduce the approach time, → exact stop limits are defined for rapid traverse and feed.

Exact stop limit

When all path axes reach their exact stop limits, the control responds as if it had reached its precise destination point. A block advance of the → part program occurs.

External work offset

Work offset specified by the → PLC.

Fast retraction from the contour

When an interrupt occurs, a motion can be initiated via the CNC machining program, enabling the tool to be quickly retracted from the workpiece contour that is currently being machined. The retraction angle and the distance retracted can also be parameterized. An interrupt routine can also be executed following the fast retraction.

Feed override

The programmed velocity is overridden by the current velocity setting made via the → machine control panel or from the → PLC (0 to 200%). The feedrate can also be corrected by a programmable percentage factor (1 to 200%) in the machining program.

Finished-part contour

Contour of the finished workpiece. See → Raw part.

Fixed machine point

Point that is uniquely defined by the machine tool, e.g. machine reference point.

Fixed-point approach

Machine tools can approach fixed points such as a tool change point, loading point, pallet change point, etc. in a defined way. The coordinates of these points are stored in the control. The control moves the relevant axes in → rapid traverse, whenever possible.

Frame

A frame is an arithmetic rule that transforms one Cartesian coordinate system into another Cartesian coordinate system. A frame contains the following components: → work offset, → rotation, → scaling, → mirroring.

Geometry

Description of a → workpiece in the → workpiece coordinate system.

Geometry axis

The geometry axes form the 2 or 3-dimensional → workpiece coordinate system in which, in → part programs, the geometry of the workpiece is programmed.

Ground

Ground is taken as the total of all linked inactive parts of a device which will not become live with a dangerous contact voltage even in the event of a malfunction.

Helical interpolation

The helical interpolation function is ideal for machining internal and external threads using form milling cutters and for milling lubrication grooves.

The helix comprises two motions:

- Circular motion in one plane
- A linear motion perpendicular to this plane

High-level CNC language

The high-level language is used to write NC programs, → synchronized actions, and → cycles. It provides: control structures → user-defined variables, → system variables, → macro programming.

High-speed digital inputs/outputs

The digital inputs can be used for example to start fast CNC program routines (interrupt routines). High-speed, program-driven switching functions can be initiated via the digital CNC outputs

HIGHSTEP

Summary of programming options for → PLCs of the AS300/AS400 system.

HW Config

SIMATIC S7 tool for the configuration and parameterization of hardware components within an S7 project

Identifier

In accordance with DIN 66025, words are supplemented using identifiers (names) for variables (arithmetic variables, system variables, user variables), subprograms, key words, and words with multiple address letters. These supplements have the same meaning as the words with respect to block format. Identifiers must be unique. It is not permissible to use the same identifier for different objects.

Inch measuring system

Measuring system which defines distances in inches and fractions of inches.

Inclined surface machining

Drilling and milling operations on workpiece surfaces that do not lie in the coordinate planes of the machine can be performed easily using the function "inclined-surface machining".

Increment

Travel path length specification based on number of increments. The number of increments can be stored as → setting data or be selected by means of a suitably labeled key (i.e. 10, 100, 1000, 10000).

Incremental dimension

Incremental dimension: A destination for axis traversal is defined by a distance to be covered and a direction referenced to a point already reached. See → Absolute dimension.

Intermediate blocks

Motions with selected → tool offset (G41/G42) may be interrupted by a limited number of intermediate blocks (blocks without axis motions in the offset plane), whereby the tool offset can still be correctly compensated for. The permissible number of intermediate blocks which the controller reads ahead can be set in system parameters.

Interpolator

Logic unit of the → NC that defines intermediate values for the motion to be carried out in individual axes based on information on the end positions specified in the part program.

Interpolatory compensation

Mechanical deviations of the machine are compensated for by means of interpolatory compensation functions, such as → leadscrew error, sag, angularity, and temperature compensation.

Interrupt routine

Interrupt routines are special → subprograms that can be started by events (external signals) in the machining process. A part program block which is currently being worked through is interrupted and the position of the axes at the point of interruption is automatically saved.

Inverse-time feedrate

The time required for the path of a block to be traversed can also be programmed for the axis motion instead of the feed velocity (G93).

JOG

Operating mode of the control (setup mode): The machine can be set up in JOG mode. Individual axes and spindles can be traversed in JOG mode by means of the direction keys. Additional functions in JOG mode include: → Reference point approach, → Repos, and → Preset (set actual value).

Key switch

The key switch on the → machine control panel has four positions that are assigned functions by the operating system of the controller. The key switch has three different colored keys that can be removed in the specified positions.

Keywords

Words with specified notation that have a defined meaning in the programming language for → part programs.

KV

Servo gain factor, a control variable in a control loop.

Leading axis

The leading axis is the → gantry axis that exists from the point of view of the operator and programmer and, thus, can be influenced like a standard NC axis.

Leadscrew error compensation

Compensation for the mechanical inaccuracies of a leadscrew participating in the feed. The controller uses stored deviation values for the compensation.

Limit speed

Maximum/minimum (spindle) speed: The maximum speed of a spindle can be limited by specifying machine data, the → PLC or → setting data.

Linear axis

In contrast to a rotary axis, a linear axis describes a straight line.

Linear interpolation

The tool travels along a straight line to the destination point while machining the workpiece.

Load memory

The load memory is the same as the → working memory for the CPU 314 of the → PLC.

Look Ahead

The **Look Ahead** function is used to achieve an optimal machining speed by looking ahead over an assignable number of traversing blocks.

Machine axes

Physically existent axes on the machine tool.

Machine control panel

An operator panel on a machine tool with operating elements such as keys, rotary switches, etc., and simple indicators such as LEDs. It is used to directly influence the machine tool via the PLC.

Machine coordinate system

A coordinate system, which is related to the axes of the machine tool.

Machine zero

Fixed point of the machine tool to which all (derived) measuring systems can be traced back.

Machining channel

A channel structure can be used to shorten idle times by means of parallel motion sequences, e.g. moving a loading gantry simultaneously with machining. Here, a CNC channel must be regarded as a separate CNC control system with decoding, block preparation and interpolation.

Macro techniques

Grouping of a set of statements under a single identifier. The identifier represents the set of consolidated statements in the program.

Main block

A block preceded with ":" that contains all information to start the operating sequence in a → part program.

Main program

The term "main program" has its origins during the time when part programs were split strictly into main and → subprograms. This strict division no longer exists with today's SINUMERIK NC language. In principle, any part program in the channel can be selected and started. It then runs through in → program level 0 (main program level). Further part programs or → cycles as subprograms can be called up in the main program.

MDI

Operating mode of the control: Manual Data Input. In the MDI mode, individual program blocks or block sequences with no reference to a main program or subprogram can be input and executed immediately afterwards through actuation of the NC start key.

Messages

All messages programmed in the part program and → alarms detected by the system are displayed on the operator panel in plain text with date and time and the corresponding symbol for the deletion criterion. Alarms and messages are displayed separately.

Metric measuring system

Standardized system of units: For length, e.g. mm (millimeters), m (meters).

Mirroring

Mirroring reverses the signs of the coordinate values of a contour, with respect to an axis. It is possible to mirror with respect to more than one axis at a time.

Mode

An operating concept on a SINUMERIK control The following modes are defined: → Jog, → MDI, → Automatic.

Mode group

Axes and spindles that are technologically related can be combined into one mode group. Axes/spindles of a mode group can be controlled by one or more → channels. The same → mode type is always assigned to the channels of the mode group.

NC

Numerical Control component of the → CNC that executes the → part programs and coordinates the movements of the machine tool.

Network

A network is the connection of multiple S7-300 and other end devices, e.g. a programming device via a → connecting cable. A data exchange takes place over the network between the connected devices.

NRK

Numeric robotic kernel (operating system of → NC)

NURBS

The motion control and path interpolation that occurs within the control is performed based on NURBS (**N**on **U**niform **R**ational **B**-**S**plines). This provides a uniform procedure for all internal interpolations.

OEM

The scope for implementing individual solutions (OEM applications) has been provided for machine manufacturers, who wish to create their own user interface or integrate technology-specific functions in the control.

Offset memory

Data range in the control, in which the tool offset data is stored.

Oriented spindle stop

Stops the workpiece spindle in a specified angular position, e.g. in order to perform additional machining at a particular location.

Overall reset

In the event of an overall reset, the following memories of the → CPU are deleted:

- → Working memory
- Read/write area of → load memory
- → System memory
- → Backup memory

Override

Manual or programmable possibility of intervention that enables the user to override programmed feedrates or speeds in order to adapt them to a specific workpiece or material.

Part program

Series of statements to the NC that act in concert to produce a particular → workpiece. Likewise, this term applies to execution of a particular machining operation on a given → raw part.

Part program block

Part of a → part program that is demarcated by a line feed. There are two types: → main blocks and → subblocks.

Part program management

Part program management can be organized by → workpieces. The size of the user memory determines the number of programs and the amount of data that can be managed. Each file (programs and data) can be given a name consisting of a maximum of 24 alphanumeric characters.

Path axis

Path axes include all machining axes of the → channel that are controlled by the → interpolator in such a way that they start, accelerate, stop, and reach their end point simultaneously.

Path feedrate

Path feedrate affects → path axes. It represents the geometric sum of the feedrates of the → geometry axes involved.

Path velocity

The maximum programmable path velocity depends on the input resolution. For example, with a resolution of 0.1 mm the maximum programmable path velocity is 1000 m/min.

PCIN data transfer program

PCIN is a utility program for sending and receiving CNC user data (e.g. part programs, tool offsets) via the serial interface. The PCIN program can run under MS-DOS on standard industrial PCs.

Peripheral module

I/O modules represent the link between the CPU and the process.

I/O modules are:

- → Digital input/output modules
- → Analog input/output modules
- → Simulator modules

PLC

Programmable Logic Controller: → Programmable logic controller. Component of → NC: Programmable control for processing the control logic of the machine tool.

PLC program memory

SINUMERIK 840D sl: The PLC user program, the user data and the basic PLC program are stored together in the PLC user memory.

PLC programming

The PLC is programmed using the **STEP 7** software. The STEP 7 programming software is based on the **WINDOWS** standard operating system and contains the STEP 5 programming functions with innovative enhancements.

Polar coordinates

A coordinate system which defines the position of a point on a plane in terms of its distance from the origin and the angle formed by the radius vector with a defined axis.

Polynomial interpolation

Polynomial interpolation enables a wide variety of curve characteristics to be generated, such as **straight line, parabolic, exponential functions** (SINUMERIK 840D sl).

Positioning axis

Axis that performs an auxiliary motion on a machine tool (e.g. tool magazine, pallet transport). Positioning axes are axes that do not interpolate with → path axes.

Pre-coincidence

Block change occurs already when the path distance approaches an amount equal to a specifiable delta of the end position.

Program block

Program blocks contain the main program and subprograms of → part programs.

Program level

A part program started in the channel runs as a → main program on program level 0 (main program level). Any part program called up in the main program runs as a → subprogram on a program level 1 ... n of its own.

Programmable frames

Programmable → frames enable dynamic definition of new coordinate system output points while the part program is being executed. A distinction is made between absolute definition using a new frame and additive definition with reference to an existing starting point.

Programmable logic controller

Programmable logic controllers (PLCs) are electronic controllers, the function of which is stored as a program in the control unit. This means that the layout and wiring of the device do not depend on the function of the controller. The programmable logic control has the same structure as a computer; it consists of a CPU (central module) with memory, input/output modules and an internal bus system. The peripherals and the programming language are matched to the requirements of the control technology.

Programmable working area limitation

Limitation of the motion space of the tool to a space defined by programmed limitations.

Programming key

Characters and character strings that have a defined meaning in the programming language for → part programs.

Protection zone

Three-dimensional zone within the → working area into which the tool tip must not pass.

Quadrant error compensation

Contour errors at quadrant transitions, which arise as a result of changing friction conditions on the guideways, can be virtually entirely eliminated with the quadrant error compensation. Parameterization of the quadrant error compensation is performed by means of a circuit test.

R parameters

Arithmetic parameter that can be set or queried by the programmer of the → part program for any purpose in the program.

Rapid traverse

The highest traverse velocity of an axis. It is used, for example, when the tool approaches the → workpiece contour from a resting position or when the tool is retracted from the workpiece

contour. The rapid traverse velocity is set on a machine-specific basis using a machine data item.

Reference point

Machine tool position that the measuring system of the → machine axes references.

Rotary axis

Rotary axes apply a workpiece or tool rotation to a defined angular position.

Rotation

Component of a → frame that defines a rotation of the coordinate system around a particular angle.

Rounding axis

Rounding axes rotate a workpiece or tool to an angular position corresponding to an indexing grid. When a grid index is reached, the rounding axis is "in position".

RS-232-C

Serial interface for data input/output. Machining programs as well as manufacturer and user data can be loaded and saved via this interface.

Safety functions

The controller is equipped with permanently active monitoring functions that detect faults in the → CNC, the → PLC, and the machine in a timely manner so that damage to the workpiece, tool, or machine is largely prevented. In the event of a fault, the machining operation is interrupted and the drives stopped. The cause of the malfunction is logged and output as an alarm. At the same time, the PLC is notified that a CNC alarm has been triggered.

Scaling

Component of a → frame that implements axis-specific scale modifications.

Setting data

Data which communicates the properties of the machine tool to the NC as defined by the system software.

Softkey

A key, whose name appears on an area of the screen. The choice of softkeys displayed is dynamically adapted to the operating situation. The freely assignable function keys (softkeys) are assigned defined functions in the software.

Software limit switch

Software limit switches limit the traversing range of an axis and prevent an abrupt stop of the slide at the hardware limit switch. Two value pairs can be specified for each axis and activated separately by means of the → PLC.

Spline interpolation

With spline interpolation, the controller can generate a smooth curve characteristic from only a few specified interpolation points of a set contour.

Standard cycles

Standard cycles are provided for machining operations which are frequently repeated:

- For the drilling/milling technology
- For turning technology

The available cycles are listed in the "Cycle support" menu in the "Program" operating area. Once the desired machining cycle has been selected, the parameters required for assigning values are displayed in plain text.

Subblock

Block preceded by "N" containing information for a sequence, e.g. positional data.

Subprogram

The term "subprogram" has its origins during the time when part programs were split strictly into →main and subprograms. This strict division no longer exists with today's SINUMERIK NC language. In principle, any part program or any → cycle can be called up as a subprogram within another part program. It then runs through in the next → program level (x+1) (subprogram level (x+1)).

Synchronization

Statements in → part programs for coordination of sequences in different → channels at certain machining points.

Synchronized actions

1. Auxiliary function output
During workpiece machining, technological functions (→ auxiliary functions) can be output from the CNC program to the PLC. For example, these auxiliary functions are used to control additional equipment for the machine tool, such as quills, grabbers, clamping chucks, etc.
2. Fast auxiliary function output
For time-critical switching functions, the acknowledgement times for the → auxiliary functions can be minimized and unnecessary hold points in the machining process can be avoided.

Synchronized axes

Synchronized axes take the same time to traverse their path as the geometry axes take for their path.

Synchronized axis

A synchronized axis is the → gantry axis whose set position is continuously derived from the motion of the → leading axis and is, thus, moved synchronously with the leading axis. From the point of view of the programmer and operator, the synchronized axis "does not exist".

System memory

The system memory is a memory in the CPU in which the following data is stored:

- Data required by the operating system
- The operands timers, counters, markers

System variable

A variable that exists without any input from the programmer of a → part program. It is defined by a data type and the variable name preceded by the character \$. See → User-defined variable.

Tapping without compensating chuck

This function allows threads to be tapped without a compensating chuck. By using the interpolating method of the spindle as a rotary axis and the drilling axis, threads can be cut to a precise final drilling depth, e.g. for blind hole threads (requirement: spindles in axis operation).

Text editor

See → Editor

TOA area

The TOA area includes all tool and magazine data. By default, this area coincides with the → channel area with regard to the access of the data. However, machine data can be used to specify that multiple channels share one → TOA unit so that common tool management data is then available to these channels.

TOA unit

Each → TOA area can have more than one TOA unit. The number of possible TOA units is limited by the maximum number of active → channels. A TOA unit includes exactly one tool data block and one magazine data block. In addition, a TOA unit can also contain a toolholder data block (optional).

Tool

Active part on the machine tool that implements machining (e.g. turning tool, milling tool, drill, LASER beam, etc.).

Tool nose radius compensation

Contour programming assumes that the tool is pointed. Because this is not actually the case in practice, the curvature radius of the tool used must be communicated to the controller which then takes it into account. The curvature center is maintained equidistantly around the contour, offset by the curvature radius.

Tool offset

Consideration of the tool dimensions in calculating the path.

Tool radius compensation

To directly program a desired → workpiece contour, the control must traverse an equidistant path to the programmed contour taking into account the radius of the tool that is being used (G41/G42).

Transformation

Additive or absolute zero offset of an axis.

Travel range

The maximum permissible travel range for linear axes is ± 9 decades. The absolute value depends on the selected input and position control resolution and the unit of measurement (inch or metric).

User interface

The user interface (UI) is the display medium for a CNC in the form of a screen. It features horizontal and vertical softkeys.

User memory

All programs and data, such as part programs, subprograms, comments, tool offsets, and work offsets / frames, as well as channel and program user data, can be stored in the shared CNC user memory.

User program

User programs for the S7-300 automation systems are created using the programming language STEP 7. The user program has a modular layout and consists of individual blocks.

The basic block types are:

- Code blocks
These blocks contain the STEP 7 commands.
- Data blocks
These blocks contain constants and variables for the STEP 7 program.

User-defined variable

Users can declare their own variables for any purpose in the → part program or data block (global user data). A definition contains a data type specification and the variable name. See → System variable.

Variable definition

A variable definition includes the specification of a data type and a variable name. The variable names can be used to access the value of the variables.

Velocity control

In order to achieve an acceptable traverse rate in the case of very slight motions per block, an anticipatory evaluation over several blocks (→ Look Ahead) can be specified.

WinSCP

WinSCP is a freely available open source program for Windows for the transfer of files.

Work offset

Specifies a new reference point for a coordinate system through reference to an existing zero point and a → frame.

1. Settable
A configurable number of settable work offsets are available for each CNC axis. The offsets - which are selected by means of G commands - take effect alternatively.
2. External
In addition to all the offsets which define the position of the workpiece zero, an external work offset can be overridden by means of the handwheel (DRF offset) or from the PLC.
3. Programmable
Work offsets can be programmed for all path and positioning axes using the TRANS statement.

Working area

Three-dimensional zone into which the tool tip can be moved on account of the physical design of the machine tool. See → Protection zone.

Working area limitation

With the aid of the working area limitation, the traversing range of the axes can be further restricted in addition to the limit switches. One value pair per axis may be used to describe the protected working area.

Working memory

The working memory is a RAM in the → CPU that the processor accesses when processing the application program.

Workpiece

Part to be made/machined by the machine tool.

Workpiece contour

Set contour of the → workpiece to be created or machined.

Workpiece coordinate system

The workpiece coordinate system has its starting point in the → workpiece zero-point. In machining operations programmed in the workpiece coordinate system, the dimensions and directions refer to this system.

Workpiece zero

The workpiece zero is the starting point for the → workpiece coordinate system. It is defined in terms of distances to the → machine zero.
